

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## OURSELVES.

IT is customary on first issuing a new paper to "take the public into confidence" and to explain the policy, aims, and objects of the new journal, as well as to make promises for the future. We are not altogether in accord with this custom, as it has been our experience that the promises of elaborate future developments so frequently a leading feature in such cases are more often than not of such a fragile and ephemeral nature that they fail to materialize. We therefore intend to depart from customary practices in this particular and to refrain from setting out any promise for future fulfilment. We will content ourselves with endeavouring to deserve the confidence of all interested in motor road locomotion. Every advance in automobilism and every investigation into its many problems will find ready acknowledgment at our hands.

In regard to the aims of THE MOTOR-CAR JOURNAL it is the wish of the proprietors that it shall be a connecting link between the manufacturer, inventor, and experimenter on the one hand and the general public on the other. It does not profess to be classed amongst the technical or scientific journals, but it does propose to fill the hiatus between the dry technicalities of experts and the commonplaces of the non-technical press or daily newspapers. Beyond all, it professes to be *independent*.

We are entirely untrammelled by any connection with companies, financiers, or groups of inventors. We own no interest in any undertaking whose business it is to make, sell, or loan motor-vehicles, and are entirely free from any

bias in favour of any system of propulsion, of design, or of method.

For the rest we have been for many years, and still remain, very deeply interested from a personal point of view in the advance of self-propelled vehicular traffic, while the work of the proprietors of this Journal in drawing public attention to the subject by means of exhibitions, and in other ways, is a matter of common knowledge.

We hold that many problems of daily life will find their solution in the adoption of self-propelled vehicles, and believe the motor-car industry has so great a future before it that, in the time to come, the closing years of the Nineteenth Century will be chiefly celebrated in history by reason of the revived interest in this branch of mechanics.

In conclusion, and in reference to the present issue, we may say that the news we have omitted, owing to want of space, amounts very nearly to the quantity we have inserted, and we think our readers will agree that we are giving sixteen pages of good matter and not charging a prohibitive price for the new MOTOR-CAR JOURNAL.

### Motor-Vehicles Wanted in Victoria.

MESSRS. PHILLIPS, ORMONDE & Co., of 533 Collins Street, Melbourne, Victoria, write us as follows:—"For years past we have been persistently advocating the use of motor-vehicles in Australia, with the result that we have now been favoured with an inquiry for motor delivery vans from one of the most powerful and influential organizations in the Colony—an organization which would soon have many followers. Two classes of vans are required—one to carry from 20 to 30 cwt., and the other from 10 to 15 cwt. Some steep grades have to be encountered, and the power is restricted neither to steam, to electricity, nor petrol. Will some of your friends, therefore, kindly furnish us with such particulars that we shall be in a position to secure the order for them." We need only add that British makers may have perfect confidence in Messrs. Phillips, Ormonde & Co., who have been known to us for several years.

## COMMENTS.

**The French  
Exhibition  
of Motor-Cars.**

It is at last definitely settled that the French Automobile Club will hold its exhibition in the Tuileries Gardens, Paris, during the period from June 13th to July 9th. It is evident that the French Club have but little sympathy with the Automobile Club of Great Britain's exhibition in London, or with that to be held under the direction of the proprietors of this Journal at the Agricultural Hall in July next, for the dates fixed interfere seriously with both shows. The dates of the Agricultural Hall Exhibition were chosen especially with a view not to interfere with the Paris exhibition, which last year closed on July 1st. However, the effect in France will be equal to that here. Fewer French firms will probably show in London, and it is certain that the English firms showing in Paris will be many less than would have been the case had the dates not clashed.

**The Daily Press  
and Mechanical  
Locomotion.**

THE tone of the daily newspapers in regard to automobilism and motor-cars generally is fortunately much less ridiculous and sensational than was the case some little time ago, but there is still room for improvement in some quarters. We certainly hear less of "exploding electric cabs" "gushing forth violet streams of forked lightnings," but when a slight breakdown does happen to a motor-vehicle the very most is made of it, whilst accidents occurring to horse-drawn vehicles are, of course, now so common that but little attention is paid to them unless very serious injuries or actual death results to human beings. The increased prominence given to motor-car accidents arises solely from their rarity, and not from the reason that the damage to life or limb is more serious. Indeed, until the lamentable and altogether inexplicable accident at Harrow the other day, we do not believe that accidents to motor-vehicles in Great Britain have resulted in either injury or death to any person travelling in them excepting on one occasion.

**Electric Cabs  
in  
London.**

THE London Electrical Cab Company have now completed their new charging plant, consisting of two complete sets of Babcock and Wilcox boilers, Willans' engines, and General Electric Company's dynamos, having a total horse-power of 500. They have found this plant a great convenience, and by its means have effected a considerable saving in the cost of current, which previously was taken from the Supply Company's mains. Besides this, under the old arrangement it was only possible to charge the batteries during a few hours after 1 a.m., and consequently many batteries were improperly charged, or the current was put into the batteries too rapidly. By means of the new plant it is possible to continue the charging throughout the day and night if desired, and thus considerable convenience is gained. We understand that the Company are about to shut down their works for a fortnight or so, and to call in all the cabs now in the streets. This is for a two-fold reason. First, all the cabs now in the streets are to be over-hauled, repaired, and re-decorated; and, secondly, more new cabs are to be equipped and fitted up. Slight alterations are also to be carried out at the depot. About the first week in April the company will again start active operations with at least 80 vehicles plying for hire. In addition they are fitting up a superior form of brougham, the intention being to let out a large number of these vehicles as private broughams for balls, dinner-parties, theatres, etc. We are glad to record

that the freedom from breakdowns is now absolute, and all annoyance on this head is a thing of the past. In addition, most of the difficulties experienced in running the cabs are now removed, and they are being run at a profit, though not a very large one at present. Mr. Walter C. Bersey has now been elected chairman and managing director of the Company, and we trust that the experience gained in the past will permit the making of good profits in the future.

**"To-Day" on a  
Motor-Car.**

*To-Day* gives vent to the following anent a "runaway motor-car in the Riviera":—"I have always thought that one of the many advantages of a motor-car was that it would wait patiently outside your hotel while you went in to see a man about a canary, that it would not catch cold from long waiting, and that it would not bolt from impatience. Well, one by one all our illusions leave us! Prince Lubomirskri's motor-car had been left outside the Hotel Beau Rivage. It seems to have been one of those full-blooded, nervous, excitable motor-cars, and something may have scared it, or it may have felt that it was time to get home. Anyhow, it bolted. According to the report, the driver went in pursuit, and was knocked down and run over. This looks very much as if the driver, from sheer force of habit, had tried to hang on to the animal's head, and found out, all too late, that there was not any head. The right spot to jump for in stopping a motor car has yet to be clearly indicated. The car, further maddened, no doubt, by the pursuit, ran into a carriage and pair belonging to the late Baron de Reuter, went for an Englishman and his wife, who dodged it, and finally banged into the entrance of the Hotel des Anglais. Having thus expressed its contempt for all foreigners, it seems to have subsided. Both the motor-car and the driver were injured, and one hears without a pang that the former cannot recover. If a motor-car will not consent to wait five minutes outside a very good hotel in a warm Southern climate, it is of no use, and ought to be dead." Of course, such an accident could only occur through the most gross carelessness, even under the most trying conditions.

**Sleepy  
Dorchester.**

DORCHESTER is evidently not yet quite up to date, for the *Dorset County Chronicle* thinks it worth while to chronicle, in its columns of the 2nd inst., the fact that a motor-car passed through the town on the previous day, and recording the fact that this was "a sight still rare enough to cause a wild sensation in the streets."

**A New  
Electrical  
Vehicle.**

DURING a recent visit we were shown the photograph and drawing of a vehicle which is set to do a really marvellous task. The vehicle is an electrical one, and is propelled by two distinct motors, one geared to each rear road-wheel. It is asserted for this vehicle that it is matched to travel between New York and Philadelphia, a distance of over ninety-three miles, and at its journey's end to still carry in its accumulators sufficient current to propel it at full speed, on a level road, for four hours. This will, of course, at once appear as a bit of Yankee exaggeration, but in due time we are promised unassailable evidence of the tests. It need hardly be said that the batteries are of an entirely new type, but the vehicle is not specially built for the trip, although it will carry 50 per cent. more batteries than its normal capacity. We are sure our readers will await confirmation of this marvellous performance with interest equal to that of ourselves.

**Motor-Tricycles  
and  
Quadricycles.**

By a visit to the French capital one is able to form some idea of the immense boom that exists at present in France in all branches of the motor-car industry, and more especially in motor-tricycles and quadricycles. These light and handy vehicles are in evidence everywhere; in fact, during one half-hour there recently passed us in the Avenue de la Grande Armée forty-eight of these light vehicles. In England, too, we are glad to note a corresponding activity in this class of vehicle. It is rather an open question whether British manufacturers did not commence at the wrong end in first seeking to put upon the market the heavy and expensive carriages with Daimler engines. The British people are a conservative race, and are chary of expending large sums of money in what, after all, is to them an untried and unknown thing, and it is open to argument whether it would not have been better policy to introduce the motor-tricycle at its comparatively low price in order to encourage progress. The motor-tricycle, whether fitted with tube or electric ignition, is a vehicle perfectly under control, possesses few complications, and is more easily understood and readily manipulated by the novice in motor-car matters than is the infinitely more complicated and heavier type of pleasure carriages. That a boom in the direction of motor-tricycles and quadricycles is in progress in England we are firmly convinced. The works of De Dion and Bouton are crammed with orders both for motors only and for the complete vehicle; and to our own knowledge a similar, though not so gigantic, demand is springing up amongst cycle engineers and manufacturers in England. That the De Dion motor is the best yet brought out for such vehicles is beyond contradiction, and the Motor Manufacturing Company, of Coventry, are extremely wise, therefore, to be first in the field in producing these motors in large quantities for immediate delivery to cycle makers for attachment to vehicles of their own construction. One small firm assured us the other day that they had passed an order to the Motor Manufacturing Company for ten of these motors, and also that an additional half-dozen had been ordered the following day—and each one of these was required for vehicles ordered by customers. We understand that the company are making these motors both with electric and tube ignition devices. We are quite certain that the coming season will see a huge development in this class of vehicle in England, and we are also convinced that no one who has enjoyed the exhilarating effects of riding these light motor-vehicles will be content until he possesses a carriage of a larger type in which he can also give enjoyment to his friends. Thus the demand for one type will create a demand for another.

**Liquid Air  
for  
Motor-Vehicles.**

PROFESSOR CHARLES E. TRIPLER, of Brooklyn, claims, according to an United States contemporary, to have solved the problem of employing liquid air as a source of power for motors of all kinds. In his own words he states: "I am happy to announce that, after years of experiment, my process for manufacturing liquid air cheaply and in large quantities is not only successful, but I have solved the problem of harnessing this great power to machinery. My engine for this purpose works, and it requires only the perfection of a few mechanical details to realize its enormous utility as a motor for all kinds of machinery—for railway trains, steamships, motor-vehicles, in short, wheresoever great force is required." Unhappily, however, according to the Professor's own admission, "the perfection of a few mechanical details" is still required, and we all know that it is these final "mechanical details" which present problems so difficult of solution. However, we wish Professor Tripler success.

**Charging and  
Repair Stations.**

It is reported that a company has been formed in Belgium to inaugurate and maintain electric-power charging stations and motor-car repair shops on all the principal high-roads of Europe. It is asserted that at such stations there will be a bar, a restaurant, a repair shop, and charging conveniences both for cars actuated by electricity and petroleum spirit. The scheme is, we fear, too grandiose, however, for fulfilment. There will shortly exist a need for such stations both on the Continent and in the British Isles, however, and the "motor posting stations" should prove remunerative if run on commercial lines.

**Motor-Vehicles  
and  
Accidents in  
France.**

IN France serious accidents are much more frequent in the motor-car world than is the case in England. This arises not only from the fact that motor-cars are much more numerous in France than in England, but also for the reason that utterly reckless speeds are permitted, whilst "rules of the road" are either entirely ignored or are non-existent. The latest recorded incident occurred in the Riviera. From reports it appears that a Parisian gentleman and three companions were returning from Monte Carlo to Nice in a motor-vehicle, and when on a steeply embanked road the car suddenly plunged down the slope, seriously injuring two ladies and M. Bouhey, the owner. The driver, who jumped from the car, escaped unhurt. According to Press telegrams the accident arose from the driver giving a wrong movement to the steering lever. But although this may be so, it is more probable, we think, that the steering lever was jerked from the driver's hand, owing to the steering wheels meeting some obstruction in the road, or else through the car suddenly "skidding." It is an open question whether the old lever steering of the Panhard style of cars is quite safe. For our own part we would much prefer the later wheel steering, especially for such high speeds as are customary in France.

**The Automobile  
Club's Easter  
Tour.**

THE Automobile Club of Great Britain has formulated the programme of its second Easter tour, and the route at present suggested is as follows:—Thursday afternoon, 31st March, to Reading; Good Friday, to Salisbury; Saturday, to Lyndhurst *via* the New Forest; Easter Monday, to Winchester *via* Romsey; Easter Tuesday, to London *via* Basingstoke. The problem with which the committee is confronted in organizing these tours is the question of the ability to obtain sufficient hotel accommodation. It is not every country hotel that can "dine and sleep" sixty customers in addition to its ordinary clientèle, and the problem is even worse in regard to luncheons, for the route is generally so arranged that large towns are avoided during the day. Motor-car trips undoubtedly make one hungry, and it is a *sine qua non* that the participants should be well catered for in regard to food. The difficulty is so great that several routes otherwise delightful have had to be discarded, and from all we can gather it would appear that if the popularity of the Club's tours increases at the present rate, some division of forces will inevitably have to take place. This is objectionable from the point of view that perhaps the most pleasant features of the tours are the "after-dinner chats" and comparisons of experience, but we fear that in the near future these will have to be conducted amongst the members of two, or possibly even three, groups.

**Provincial Exhibitions.**

THE plethora of combined cycle and motor-car exhibitions which are being held in the provinces are, we fear, not commercially profitable to the motor-car exhibitors, owing to the expense of transport and attendance. They do much, however, to popularise motor-vehicles with the general public, and thus prove useful. At the recent shows in Manchester and at Cambridge, we hear that good business was done; in fact, from what we ourselves observed in the latter town it would appear that both temporary and permanent residents are "motor-car mad" for the moment. Previous to the show there was some prejudice against motor-vehicles on the part of the police, but as we saw the Chief Constable on several occasions riding in one of the latest forms of the Motor Manufacturing Company's vehicles, we presume this prejudice has been swept away.

**Motor-Cars in the Isle of Man.**

WE are glad to note that the House of Keys has at last passed the Bill which it had under consideration for controlling the running of motor-cars in the island. The conditions imposed are not too onerous, and we hope that no automobilist will suffer any grave inconvenience from the provisions of the Bill. During the discussion of the amendments, a Mr. J. R. Cowell proposed the insertion of a clause empowering the road authorities to recover the cost of extra repairs in cases where extraordinary heavy traffic passed along roads, but exception was taken to it as being foreign to the subject of the Bill, and it was rejected. Ultimately the yearly license fees were fixed as follows: Not exceeding half a ton in weight, 10s.; not exceeding one ton, £1; not exceeding two tons, £2 2s.; over two tons, £3 3s. Clauses were also passed giving local authorities powers to make regulations for controlling the use of motor-cars in their respective districts.

**Motor-Vehicles in the Provinces of the U.S.A.**

A SPRINGFIELD, MASS., contemporary, in discussing the advance of motor-vehicles in the United States, advances the opinion that it will "take half a century of progressive road building and improved paving before any but the few largest cities in the United States could utilise motor-waggon for the ordinary purposes of traffic." Our contemporary continues:—"The recent tremendous snow-falls remind us that conditions are likely from time to time to arise in all northern cities under which the motor-waggon would be as helpless as a bicycle on a sandy road. It was more than 24 hours after the recent nine-inch snow-fall in New York before even the main avenues of travel in the business section of the metropolis were cleared of snow, and it was several days later before the rest of the city proper was cleared, to say nothing of the other boroughs of Greater New York. The spectacle must have given Mr. Croker and the other would-be revolutionists of the trucking and passenger carrying business in New York a very bad half hour's reflections. If their plan had been effected and motor-carriages and waggon had entirely supplanted horse-drawn vehicles in this city, there could not have been a pound of freight or a single carriage passenger moved in the city for many hours, and the blockade of traffic and delay of business would have been perfectly intolerable." We cannot agree with all our contemporary advances, but with the first contention, that the condition of the provincial roads of the United States are a bar to the advance of motor-vehicles in that country, we cordially concur, for their state is truly execrable.

**Motor-Vehicles on Hire.**

CONSIDERABLE profits have been derived in many places by firms running services of motor-waggonettes or *char-a-bancs* as hackney vehicles. We believe, however, that even greater profits might be derived by letting out motor-vehicles to private hirers by the day, or perhaps for even shorter periods. We hear that such a scheme is on foot at Cambridge, and that as no licences will have to be obtained, there is every possibility of its proving successful. We are also informed that a Sevenoaks gentleman contemplates inaugurating a service between Canterbury and Herne Bay during the summer.

**The Building of Motor-Cars.**

AN American technical contemporary devoted to electrical matters recently discussed the question of the building of motor-cars in its columns, and a very thoughtful article was the result. Carriage building is one of the oldest of the artistic trades and handicrafts. It has grown up through many centuries, and has formed a separate industry with workmen, traditions and reputations of its own. Probably its prosperity was at the height during the stage-coach days, but it is not unlikely that the growth of private wealth has maintained it on the whole plane of activity during the whole of the century now closing. Although the railroad companies did not long go to the coach builders for their cars, there was an enormous increase in the number of private vehicles of all classes, and thus the loss of the stage-coach was not seriously felt by the carriage builders. At the present moment, however, as the century closes, an entirely new prospect opens up, and one is led to conjecture whether the changes in carriage building may not become so revolutionary as to cause the industry to pass into new hands, unless the former directors of it are alert enough to adapt themselves promptly to the latest conditions. It is the motor-car that is the instrument of this new departure, and the outward sign of a change as great as that from bows and arrows to breech-loaders and machine guns. To state the case broadly, the carriage builders of the past have all been, practically, workers in wood. Now, while it is possible that not a little wood enters into the composition of a motor-car, it is easy to picture such vehicles, and good ones at that, into whose construction not a particle of wood enters. The modern motor-car is a thing of steel tubes, while its body may preferably consist of aluminium, light sheet steel, and a few trimmings not necessarily of leather. The motor-car embodies other problems than those of a vehicle that is hauled. It lifts itself into speed from a dead rest; it is steered within itself; its motive power is a matter of mechanism, and the questions that arise at each step are radically different from those relating to the carriages of our fathers. Our contemporary asks:—"How many carriage builders in the United States are there to-day who have given any proof of their desire and intention to head the new procession, and to be the chief beneficiaries of the new tendencies? We are constrained to answer, not one so far as we know. Some of the carriage builders are making wooden bodies to fit the running gear of various motor-cars, but, as we have suggested, that is a precarious tenure, with little promise of permanency in the new art. It does look, at this moment, as though a new crop of manufacturers must come to the front, recruited, perhaps, to some extent by the more enterprising of the old carriage builders, but consisting very largely of concerns trained in the fields of bicycle building and electricity." Whilst agreeing in some measure with this view, so far as England is concerned, we are glad to record that several of the British carriage builders are interesting themselves in the problems relating to properly built motor-cars, and the same is also true of French carriage builders.

**Motor-Car  
Wheels  
and Tires.**

THE various reports of motor-car touring and racing received from France and elsewhere, especially that of the Paris-Amsterdam journey, all show that wheels as at present constructed are not all that could be desired for motor-car work. The accident at Harrow brings this home to us in a serious manner. To construct a wheel that shall be equal to rough use, age, and violent shock is a task that no doubt many a wheelwright would undertake if not restricted as to weight, and if the carriage is to be drawn by horses. But when the wheels have to drive the car, circumstances are altogether changed, a fact not sufficiently realised. That this has not been quite neglected, however, is evident from the various devices of tangent spokes, dished plates, etc. The real difficulty, however, seems to be in the tire. Nobody would question the comfort of a rubber tire or the luxury of a pneumatic tire, but unfortunately both are costly and dangerous. The fatality at Harrow was evidently due to the tire first giving way, fouling with the brake block and the ground, and causing a general rip-up. No wonder that in France many good builders of motor-cars use old-fashioned wheels with iron tires! Is there not a middle course available, however, viz., rubber tires securely guarded by steel shoes? Of course, the resiliency would not be so good as with the bare rubber, nor would the tire be able to accommodate itself so easily to the little inequalities of the road; but the interposed rubber would give all the cushion really necessary to relieve the felloes and spokes from road shock. Perhaps no detail connected with motor-cars needs more immediate attention, and if a good solution can be found it would be readily welcomed. Of the conditions pertaining to an effective and reliable tire we shall say something more in subsequent issues. We shall also be glad to have the experience and views of our readers.

**New Styles  
of Cars.**

STIRLINGS MOTOR-CARRIAGE CO., LTD., of Hamilton, N.B., send us photographs of several of their recently designed vehicles, which for grace of design and excellence of finish are a considerable advance on previous productions. We hope to illustrate some of these in our next issue.

**The Depreciation  
of Scares  
from Motor-car  
Accidents.**

WE are glad that *To-Day* looks so sensibly on the matter of accidents to motor-cars, and their influence on the progress of the movement. Our contemporary says:—"Accidents such as these (the Harrow accident) are likely to create in the public mind a prejudice against the motor-car far beyond what is reasonable. There are accidents, I suppose, to people riding horses and to horse-drawn vehicles every day in the week, and many of them are fatal accidents, but they do not get a third of a column in the *Daily Telegraph*. The motor-car is comparatively new, and its success and failures are recorded at length in consequence. If it could be shown that motor-cars produced more accidents, in proportion to the number running, than horse-drawn vehicles, there would be a good ground for something more than prejudice, though even then we might remember that the motor is at present in its initial stage. But one or two accidents, though of a serious nature, prove nothing, and one might as fairly conceive a prejudice against railways, trains, or hansom cabs." It would be extremely difficult to prove that accidents are proportionately more numerous with motor vehicles than with horse-drawn vehicles or cycles, and we recognise the fairness of our contemporary in its temperate tone.

**Liverpool Self-  
Propelled Traffic  
Association.**

THE last meeting of the Liverpool Self-Propelled Traffic Association for the present session will be held on April 11th, when Messrs. D. H. Simpson and H. Bodman will contribute a paper. The trials of heavy vehicles inaugurated by the Association will take place from July 31st to August 2nd next, and subsequent to these dates the annual general meeting of the Association will be held.

**Electric Cabs  
in New York.**

THE Electric Vehicle Company of New York is arranging to place orders for the construction of 200 more cabs. There are to be 25 of the ordinary coupé pattern, 75 hansom cabs, 50 full-extension broughams seating four persons each, and 50 three-quarter extension broughams accommodating three persons each, the last two being new styles of vehicles. All are to be delivered by June 1st. A new building in Forty-second Street, near Third Avenue, is to be used as a construction and repair shop, and a charging station is to be built down town, and another on the east side, the Company to operate 100 vehicles from each station. From mail advices just to hand, it would appear that the shares and stock in this Company are rapidly rising. The ordinary stock a month ago was quoted at 17 dollars, and a fortnight since at 58 dollars; now a rise of ten points has taken place, and the price is 68 dollars. The preference stock a fortnight ago stood at 90 dollars. A keen New York broker calculates the accrued profits to the stockholders as follows:—"A subscriber of 10,000 dollars for the stock of the Vehicle Company received 100 shares of preferred and 225 shares of common. The preferred is now worth 90 and the common 65. This shows 23,625 dollars returned on the original investment of 10,000 dollars, or 13,625 dollars profit. Furthermore, the original subscription carried with it a call entitling the holder to the privilege of repeating the first operation two or three times more, so that the profit on the original outlay becomes something extraordinary in view of the amount of the investment."

**"Land and Water"  
on the  
late Motor-Car  
Accident.**

OF course, everyone sincerely regrets the recent fatal accident at Harrow, and naturally everyone connected with the motor-car movement is anxious to ascertain the cause in order to apply a remedy or preventive. It is evident, however, that much help cannot be expected from those outside the movement, judging from the "argument" advanced by a writer in our old-established contemporary, *Land and Water*. After alluding to the accident and the consequent verdict of the coroner's jury, the writer in our contemporary, who writes over the pseudonym "B.," continues as follows:—"At the inquest a witness stated that the tire of one of the wheels first flew off, and that then the car capsized. That was probably the real cause of the accident, though the jury imputed it to the rottenness of the spokes of one of the wheels. I have always thought that there must be some danger in using rubber tires on oil motors or steam-driven carriages. The heat from the lamps or fires must have a decided effect upon the rubber, and it seems to me that in this case the melting or softening of the tires to the point of bursting was the real cause of the disaster." It is quite evident from the truly ludicrous comment that the writer in question knows nothing whatever of the subject on which he writes. If "B." cares to accept an invitation to inspect a similar car, we will demonstrate to his satisfaction that it is impossible for the tires to receive any heat from the motor.

## The New Mors' Carriage.

NEW TWO-SEATED CAR, WITH TWO-CYLINDER ENGINE.

THE four-seated petroleum-spirit motor carriage made by the Société d'Electricité et d'Automobiles Mors, of 48 Rue du Théâtre, Grenelle, France, is now well-known in England. Now, however, the Mors Company has taken up the construction of a new type of carriage to seat two persons, which differs materially from its fore-runners and of which we are now able to give an illustration, together with a few brief particulars. To deal first with the motor, this is of the horizontal type, comprising two cylinders so arranged opposite to one another as to drive a central shaft by means of a single crank. In the larger Mors vehicles the motor, as is already fairly well known, is located in the rear portion of the vehicle; in the new two-seated carriage it is placed in the fore part, transversely with the frame. The motor is of 4 e.h.p., the ignition being electrical, on the Mors Company's peculiar system. The carburettor employed is of the well-known standard Mors constant-level float type. Ample provision is made for regulating the quantity of pure air allowed to pass into the carburettor, while a valve is also provided whereby the carburetted air drawn into the compression chamber by the suction stroke of the piston may be rarefied as desired.

The cylinders, in addition to being furnished with radial cooling discs, are also water-jacketed, the circulation of water

being maintained by a small pump. The heated water, ere it returns to the storage tank, is made to pass through a series of ribbed condensing tubes arranged in the fore part of the carriage.

Coming now to the transmission of the power of the motor to the rear road wheels, very little information is unfortunately so far available. In the large Mors carriages belt driving is employed, but in the two-seated vehicle under notice we learn that this has been discarded in favour of gear-wheels. Three forward speeds and one backward motion are provided. All the controlling gear, speed-change levers and electrical switches are mounted on the steering standard, so as to be within convenient reach of the driver. Steering is effected by means of the front wheels, which are mounted on the usual short vertical pivots. A friction clutch is introduced in the transmission mechanism, so that by means of a foot pedal the motor can be instantly put out of gear; a second foot pedal controls a hand-brake on the differential shaft, while a hand lever at the side controls brakes on the rear wheel hubs. The carriage, which is fitted with pneumatic-tired wood wheels, is neatly upholstered, and weighs complete 350 kilog., or rather less than 7 cwt.

None of these carriages have as yet been shipped to England, and the English agents of the Company, the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, W., inform us that none will be delivered for at least a fortnight. We have the pleasure, therefore, of giving our readers the earliest possible description and illustration of this excellent car.

AGRICOLA.

## Leaders in Mechanical Road Locomotion.

### No. 1.—GOTTLIEB WILHELM DAIMLER.

THE name of Gottlieb Daimler is so closely associated with the great progress made during recent years in the development of the motor-car industry that some sketch of his career will be of general interest.

He was born at Schorndorf, in Germany, in 1834, and very early showed remarkable aptitude in mechanical matters. When he left school he served an apprenticeship in an engineering works, and worked in many of the principal factories in Germany. Then he spent a few years in England, where, at the Whitworth Works, he added to his practical and sound knowledge of mechanical construction.

After visiting several foreign countries he joined Dr. Otto in an attempt to develop the gas engine, and in 1872 they, with the help of Herr Langen, a councillor of Cologne, established the Gas-Motoren Fabrik at Deutz, Herr Daimler being the manager. He initiated Messrs. Crossley Brothers, of Manchester, into the principles of gas engine construction on the Otto plan, and in 1882 relinquished his direction of the works at Deutz in order to devote all his time and thought to the introduction of a light and high-speed petroleum motor. The results of his efforts were subsequently seen in the now well-known Daimler motor.

In 1886 he succeeded in applying his motor to a bicycle for the first time with success, and, in the following year, he adapted it to a vehicle with eminent satisfaction, not only to himself but to other experts. Of course, he did not rest content with that, but has since introduced many improvements, with the result that the Daimler motor has been adopted by many of the principal motor-car constructors in France, notably by Panhard and Levassor, Peugeot, etc. In fact, the demand of late has been so great that Messrs. Panhard and Levassor, who enjoy the sole French rights of Daimler's patent, have been compelled to withhold any supplies to

other firms, retaining the privilege of using the Daimler motor only on their own cars.

It has often been thought that the "Phoenix" motor, which is slightly different to the original Daimler motor, was the invention of and was introduced by the late M. Levassor, but Herr Daimler has proved to me that such impression is erroneous, he himself having originated this improved form.

Five years ago the subject of this sketch left the Daimler Motoren Gesellschaft, and formed a new company to work the new invention which he had patented—viz., the "Phoenix" motor just referred to. This proved so successful in superseding the earlier invention that after a short time the older concern saw the wisdom of amalgamating with the newer company.

Such is the history of the introduction of the Phoenix motor. English readers well know the success that has been attained by manufacturers of their own country who have adopted these motors and the Levassor transmission method in constructing their cars.

A love of work has always characterised this well-known inventor, and from his apprenticeship he has continually devoted himself to the work of developing the motor-car industry. Esteemed by all who have had dealings with him in business affairs Herr Daimler well deserves the success he has attained as the result of his own skill and hard work.

D. FARMAN.

HERR GOTTLIEB WILHELM DAIMLER.

At a meeting held in Brussels, a mixed committee was appointed for the defence of the common interests of the cycle and automobile. The primitive programme of the separate organizations has not been changed, but an evolution has been produced in the function and attributes of the members composing that committee. The title of the new defence committee is "The National Belgian Cycle and Automobile Council." Each federation will appoint four delegates.

## MOTOR-CARS ON THE CONTINENT.

### The Inventor of the First Petroleum Spirit Motor-Car.

which is just now attracting considerable attention in French motor-car circles.

### Berlin Motor-Car Exhibition.

WE have received a copy of the prospectus which has just been issued by the Mid-European Motor-Car Club regarding the International Motor-Car Exhibition that body is organizing. The dates fixed for the exhibition are September 3rd to 28th next, and the *locale* the Exerzirhause, 34 and 35 Karlstrasse, Berlin.

### Connection Outfit for Charging Electrical Vehicles.

SOME time ago it was announced that a commission had been appointed by the Syndicat Professionnel des Industries Electriques, L'Association Amicale des Ingénieurs Electriciens, L'Automobile Club de France, and Le Syndicat des Usines d'Electricité to inquire into and report upon the means to be taken to provide charging stations in all parts of the country where owners of electrical motor-vehicles can promptly have their accumulators recharged. This commission organized a competition for the design or manufacture of a portable chest fitted with universal connections for attachments to electricity supply mains, a premium of 400 fr. (£16) being offered to the competitor whose chest is adjudged as best fulfilling the requirements set down. The chest must be so constructed that it can be carried on the outside of motor-vehicles. It must contain (1) a voltmeter, with double commutator permitting of the testing of the polarity and tension of the source of electrical energy and of the battery to be charged; (2) an electricity meter; (3) a rheostat with bi-polar interrupter; (4) be provided with a universal connection (with 2-conductor cables). All the apparatus employed must be capable of working with a current of from 70 to 80 amperes at 120 volts, while the chest must be as small and compact as possible, and be perfectly insulated. Each competitor must also submit the cost of the apparatus, and also, separately, of the connections. The apparatus submitted will remain the property of the competitors, but the commission reserves the right to exhibit and to publish descriptions of them. Full particulars of the competition may be obtained from the President du Syndicat Professionnel des Industries Electriques, Hôtel des Ingénieurs Civils, 19 Rue Blanche, Paris. It was originally intended to close the competition on 1st March last, but now the time has been extended until 1st May.

### An Italian Motor-Car Fete.

AN automobile fête is to be commenced at Verona, Italy, on Saturday next, the 11th inst., to extend over several days. On Saturday morning there will be a run from Verona to San Martino Buonalbergo and back, after which the vehicles will be placed on exhibition. On Monday there will be competitions in driving and manœuvring motor-carriages; on Tuesday a race to Mantona and back, a distance of 100 miles; on Wednesday the vehicles will again be placed on exhibition, the fête being brought to a close in the evening by the distribution of prizes, a number of which are being offered.

### Motor-Car Chains in France.

It is an acknowledged fact that self-moving vehicles have found their regeneration in late years in France and Germany, and it is therefore extraordinary that even until the present day motor-car chains are measured and called by English denominations instead of by metrical denominations, although actually made in France or Germany. Lately an attempt has been made by the French chain-makers to break away from this rule, and they have urged the adoption of metrical dimensions. The combination of English and French measurements must necessarily cause the French motor-car manufacturers considerable annoyance and trouble, as the metrical measurements become so involved when taken in conjunction with the measurement of the pitch, etc., in English inches. We fear, however, that the efforts of French chain-makers, although aided as they are by the Touring Club of France and the French Automobile Club, will not result in the builders' emancipation from these troubles, for it is impossible to compel the users to adopt the metrical system. This arises from the necessity of being able to procure in any spot a chain which will fit the sprocket wheels in the case of a breakdown without unnecessary delay or difficulty. This under the present system is the case over the whole of Europe; but if the standards suggested by the Commission of the Touring Club of France are adopted this convenience will disappear, for none of the standards suggested will synchronise with English measurements, as may be judged from the following table, which gives the suggested standards in millimetres and in inches to eight places of decimals:—

#### SUGGESTED STANDARD DIMENSIONS.

| Single Roller Chains.         |                     |                 |
|-------------------------------|---------------------|-----------------|
| Pitch.                        | Inside width.       | "Plein."*       |
| Mm. (inch).                   | Mm. (inch).         | Mm. (inch).     |
| 25 (.98426975) ...            | 13 (.51182027) ...  | 11 (.43307869)  |
| 30 (1.1811237) ...            | 15 (.59056185) ...  | 13 (.51182027)  |
| 35 (1.37797765) ...           | 20 (.7874158) ...   | 16 (.62993264)  |
| 40 (1.5748316) ...            | 20 (.7874158) ...   | 18 (.70867422)  |
| 50 (1.9685395) ...            | 25 (.98426975) ...  | 22 (.86615738)  |
| 60 (2.3622474) ...            | 30 (1.1811237) ...  | 27 (1.06301133) |
| 75 (2.95280925) ...           | 35 (1.37797765) ... | 33 (1.29923607) |
| Block and Twin Roller Chains. |                     |                 |
| 35 (1.37797765) ...           | 20 (.7874158) ...   | 24 (.94489896)  |
| 40 (1.5748316) ...            | 20 (.7874158) ...   | 28 (1.10238212) |
| 45 (1.77168555) ...           | 20 (.7874158) ...   | 32 (1.25986528) |
| 50 (1.9685395) ...            | 20 (.7874158) ...   | 36 (1.41734844) |
| 60 (2.3622474) ...            | 25 (.98426975) ...  | 42 (1.65357318) |
| 70 (2.7559553) ...            | 30 (1.1811237) ...  | 48 (1.88979792) |
| 85 (3.34651715) ...           | 35 (1.37797765) ... | 60 (2.3622474)  |
| 100 (3.937079) ...            | 40 (1.5748316) ...  | 70 (2.7559553)  |

\*[By this term is meant the length of the block in block chains, and the diameter of the roller in single roller chains, or practically what may be termed the length of the tooth spaces in the chain wheels. In the twin roller chain the "plein" is equal to double the diameter of the rollers, plus the space between the twin-rollers—this space being fixed at 2 mm.—Ed. M.-C. J.]

### A Brake-Cooling Device.

HERR G. DAIMLER, in conjunction with Mme. Veuve Levassor, has lately taken out a patent in France for a device the object of which is the cooling of the band-brake disc or drum on motor-vehicles. It consists of a small water tank and conduit, which conveys water drop by drop to the drum. This is done only when the brake is in use, the lever by means of which the brake is applied being so connected to the valve on the tank as to open the valve when the brake is applied, and to close it when the brake is released.

## Electric Cabs for Paris.

IN France the claims of pleasure are so frequently placed before those of business that it was not surprising to find French builders of motor-cars giving their first consideration to light, comfortable, and speedy vehicles for excursions, etc. This contrasted strongly with the aim of English makers to attain success in the introduction of vehicles for ordinary public traffic before they thought of the lighter and less necessary self-propelled pleasure conveyances. And so, notwithstanding the efforts of M. Bixio, the general manager of the Compagnie Générale des Voitures, to introduce them in Paris, the first service of self-propelled cabs for general use was tried in the English capital.

Frequent have been the rumours as to the introduction of electric cabs into Paris, and many have been the disappointments at their non-appearance after having been heralded in the Press. Nothing of the extensive character suggested has, however, been done up to the present, and the old-

electric four-wheelers familiar to London, important differences existing in many features, although they are certainly modelled on some of Mr. Bersey's lines.

THE OPEN COUPÉ.

It is the intention to commence the new service with three different models—the landaulet, the open coupé, and the closed coupé, illustrations of which accompany this article.

THE LANDAULET.

fashioned conveyances have continued to monopolise the means of ready transit to and from various parts of the city.

At length, however, there is a prospect of an early service of these desirable cabs in Paris, 150 being now in course of construction at Aubervilliers, whither I have been, by the courteous permission of M. Bixio, to confirm this latest rumour which will soon be converted into actual fact. At the outset it should be understood that the cabs to be placed on the Parisian boulevards are not exactly like Bersey's

THE STANDARD VEHICLE FRAME.

In all three models the frame is exactly the same, any description of body being interchangeable. The method of transmission is very similar to that adopted in the London cabs,

and the storage battery is hung under the vehicle in the same way. A special commutator controls the current, which is thus allowed to pass gradually into the electric motor.

The cab weighs 2,000 kilogrammes, of which the accumulators account for 800; this weight will probably be reduced. Beneath the driver's seat is the commutator, controlled by a lever on the left hand; on the right is a steering wheel, which communicates the direction to the fore-carriage. The maximum speed attainable is 15 kilometres. Pneumatic tires are fitted on the front wheels and solid rubber tires on the rear wheels, the former being provided in the hope that the life of the accumulator will be considerably extended.

AN AVENUE IN THE DEPÔT.

The motor is placed at the rear of the frame, and conveys power to the differential shaft through the action of cog-gearing to the intermediary shaft; the pinion is made of raw hide to secure quiet working at the comparatively high speed necessary. The intermediary shaft carries the differential gear, and power is transmitted to the road wheels through the two chains, of Renold's design but of French manufacture. The employment of such chains on the driving wheels is, perhaps, not to be commended, seeing that they

THE BATTERY CHARGING ROOM.

are considerably exposed to the corroding influence of dust and mud. Indeed, we understand that Mr. Hans Renold has himself condemned the use of his chains for such purposes.

Although the motor and every other part of the vehicle has been made in France, a study has evidently been made of the English system, and some of its features have been imitated. For instance, the control of the current is very similar to that in Bersey's cab. The armature of the motor and the electro-magnets are wound in two separate circuits. Without acting on the connections of the

battery, four different speeds ahead, two electric brakes, and a reverse speed are obtained. When the vehicle is stopped, or when the mechanical brake is brought into play, no connection whatever exists between the battery and the motor. When the controlling lever is in the first position, current at 80 volts pressure is sent through the artificial resistance, travelling through the induction coils and the two windings of the armature connected in series. In the second position—corresponding to the second speed—the current is applied through the armature and induction coils, the resistance being thrown out of circuit. When the lever is brought to the third position, the current passes through the two windings of the induction coils and through the two windings of the armature connected in parallel. The fourth speed is obtained in connecting in parallel the armature and induction coil windings, the current passing through these two combinations grouped in series. The first electric brake is obtained by short circuiting all the windings in series through the resistance, and the second by cutting out the resistance from the short circuit. To obtain the reverse speeds the direction of the current in the armature is changed.

THE POWER HOUSE.

The buildings at Aubervilliers devoted to this new section of the business of the Compagnie Générale will ultimately have a capacity for 1,500 electric cabs, but, as already mentioned, only one-tenth of that number is under actual construction for the service about to be inaugurated. The station occupies a piece of ground covering 40,000 square mètres. Some idea of the general design of the cabs will be gleaned from the illustrations. A view of the dépôts for the cabs is also given, as well as of the charging station. This latter has two plants, each of 250 h.p., the steam-engines having been supplied by MM. Pignet and Company, of Lyons, and the dynamos built by Alioth. The dynamos generate current at 125 volts and 1,200 ampères. The steam generators are of the Bonnet-Spazin water-tube type. The current is transmitted from the switchboard to the charging floor by eight cables, four for each dynamo. A very ingenious automatic hydraulic device has been adopted for taking the batteries from the cabs and switching them into the charging chamber. The "Julien" cells have been adopted by the constructors as being best for the hard work that will be expected of these cabs.

Before finally deciding upon the style of the cabs now constructed, many experiments were made and several electric cars and cabs were examined, with the result that the company and its chief engineer, M. A. Cauzonne, have every confidence in the success of the innovation. D. FARMAN.

## SCOTTISH NOTES.

### A Bit of History.

Two and a half years ago the motor-car was an unknown animal or thing in the land of "brown heath"—and other excellent things; except for the apparition that a very few people are believed to have seen a few months earlier in the form of "something on wheels without a horse," driven about in certain localities after night-fall by a gentleman, whom the police after a while ventured to lay hold of, and who turned out to be—not the dark gentleman that some of the superstitious old ladies took him to be—but that most enthusiastic of Scotch motor-carists, Mr. T. R. B. Elliot, of Kelso. To this gentleman, I think, belongs the honour of being the first Scotch owner of a modern motor-car. Naturally he had to pay the penalty of his temerity, and this in the form of a fine inflicted by the Berwick magistrates, the charge being proved that he had failed to employ a fore-runner with the "red flag." This car was a Paris-built "Daimler" imported before the Light Locomotives Act of 1896. November of the same year, as all the world knows, gave us "Emancipation Day," with which began the dawn of a new era in the history of road locomotion in the British Isles, and opened the way for the establishment of a new industry of vast and far-reaching importance. North-countrymen were alive to the possibilities thus presented, and rumours were then as prevalent as influenza is now of the great things in the motor line, which various people more or less mechanical in various parts of Scotland had up their sleeves, and with which they would shortly startle the world; and so the country waited.

### The First Motor-Car Built in Scotland.

In January, 1897, the first commercial motor-car built in Scotland was completed. An old-established firm of coachbuilders had a man at its head who saw better and further than other men, and had been at work quietly. At this early date he appears to have taken a firmer grasp of the problems of the mechanical carriage than many engineers of note, who now, after spending thousands of pounds on fruitless experiment, are beginning where Stirlings, of Hamilton, began two years since. In the history of the new movement, the name of John Stirling, of Hamilton, will be conspicuous as the pioneer of the motor industry in Scotland, and it is commonly acknowledged in the North that but for Mr. Stirling there would have been no motor industry here, or, at any rate, it would not have reached anything like the large proportions it has so quickly attained. Mr. Stirling, at the outset, settled with himself the first great point, that was, that he knew nothing whatever about mechanical carriages; and, second, that the French knew a great deal. Forthwith he decided to take up the best that the French had produced. He selected the Daimler-Panhard system; and the wisdom of his selection time has confirmed. With the Daimler motor, therefore, he started, and in the short space of two years very large numbers of Stirling-Daimlers have been distributed all over the country, doing excellent service.

### A Scottish Club.

A MOVEMENT is at present on foot having for its object the formation of a Scottish Motor-Car Club, and several of the leading lights are, I believe, giving it their hearty support. The proposal is a good one, and a well-organised club is certain to do much to increase the public interest in the business and pastime of automobilism. I hope to be able to say more on this subject next week.

### Motor-Car Shows.

At the Edinburgh cycle and motor-car show last month the motor-car section was undoubtedly the chief attraction, and there is little wonder, for here were exhibited examples of nearly every system, and in the large Waverley Market a special track was screened off for showing the vehicles in motion. The largest and finest display was that of Stirling's Motor Carriages, Limited, who had a tastefully decorated stand some 60 feet long, and showed six handsome carriages fitted with improved Daimler motors, comprising a brougham, family omnibus, with movable top, hooded stanhope, two dogcarts, and a waggonette for six. All the designs were quite new and very elegant. A steam omnibus to seat twenty and a steam waggon to carry four tons were also exhibited, and last but not least a line of new Pennington cars, including the well known "Victoria," also an exceedingly pretty car to seat three or four persons, with body of polished walnut, and the price (135 guineas) surprised everybody. A new Pennington double-cylinder car and two Pennington tricycles completed this highly important exhibit. I understand Messrs. Stirling have secured the sole right for the sale of Pennington motors in Scotland. Next in line was the Madelvic Motor Company, Limited, of Granton, who had on show several well-designed and finished electric cars, which, however, were not shown in motion. They comprised an elegant double brougham, two gigs, two light delivery vans, and several light parcel carriers, all of them fitted with the Company's patent leather tires. The Edinburgh Auto-car Company showed two carriages built by the Motor Manufacturing Company, Limited, and fitted with motors on the Daimler system, a Bollée, a tricycle, and a quadricycle by the Beeston Motor Company. The Benz Motor Company, of Aberdeen, exhibited two cars on the well-known Benz system—a single-cylinder sociable and double-cylinder dog-cart, both elegant and well-finished.

### Mors versus Pennington.

A LIVELY interest is being taken here in the challenge issued by the Automobile Association, Limited, of London, in which they allege that their Mors car is the fastest road carriage in this country. Messrs. Pennington & Baines have accepted the challenge, but as difficulties might arise with the authorities in conducting a speed contest in the public highway, they suggest that one of the steepest gradients should be selected, and that the competing cars should ascend and descend the same (the descent not to be at a greater speed than the ascent) a hundred or more times. The car ascending the oftenest in a given time to be declared the winner. One hill, I observe, suggested by Mr. Pennington is that leading up to Arthur's Seat, Edinburgh. The general opinion here is that a motor-car could be put to no severer test, and hope is expressed that no quibbles may be raised by either party to prevent the carrying out of so interesting and instructive a contest.

### Heavy Motor-Vehicles in Burns' Land.

THE adoption of heavy motor-vehicles for transport purposes has been slower here than in the south, but there is evidence this year that some of the leading contractors and large carrying concerns will make a trial of mechanical traction, and I have no doubt if steam waggons, such as are built by the Steam Motor Company, Leyland, are introduced, their general adoption will be but the matter of time. Altogether the horseless-vehicle movement in Scotland is in a vigorous and healthy condition, and the industry having been saved from the bane of the voracious company-monger, has been established on a thoroughly sound foundation.

BROWN HEATHER.

## CORRESPONDENCE.

## THE PENNINGTON CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At a time when so much interest is centred in the Pennington car, perhaps a few words concerning a run on the same may be of interest to your readers. I was much impressed with the Pennington car, and was deliberating in my mind whether to buy one or not, when it struck me I should like to make a thorough trial before I finally decided. Mr. Pennington granted this, so I accordingly set out for King's Lynn on Saturday morning. The weather was very bad—rain in the early morning, and snow and frost and bitter wind later on. This in no way affected the motor, which behaved excellently throughout, covering the 130 miles from Manchester to King's Lynn in ten hours. A fast time was out of the question, as I had several times to stop and warm myself. I mounted some very stiff gradients round Chesterfield, and no other motor that I know of would have gone up them at the pace the Pennington did. Arrived at Lynn, I made some hill-climbing tests with a well-known motorist, weighing 16 stone, on board, and he was astonished at the pace on the hills, declaring it went up hill almost as fast as it went on the level. I may add I purchased a Pennington motor.

Yours sincerely,

DUDLEY GRIERSON.

20 Gloucester Square, Hyde Park, W.

## A CHAMPION CYCLIST AND MOTOR-TRICYCLES

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been interested in motors since their first appearance, and have made considerable use of them for pacing purposes in France during the past two years. I am at present the owner of a motor-tricycle which I believe to be the fastest in England, and it was with this I carried off the motor-cycle tests of speed and hill-climbing powers at the recent Liverpool show against all competitors in so easy a fashion. Many times I have done thirty-three miles in the hour on this machine. Since I have been located in Manchester, I have often seen the Pennington motors running about the town. Several times had I been informed that these motors were capable of doing wonderful speeds, but I thought their capabilities were really over-estimated. During the Manchester show I went to the Botanical Gardens with a view of testing their speed against my tricycle in a friendly way. I was fortunately able to arrange for a speed race for a distance of several miles. In starting out, I took the lead and kept it for some short distance, when, to my surprise, Mr. Pennington came along with a tremendous burst of speed, and left me out of the running completely. With three people up, as Mr. Pennington had on his machine, I believe he was travelling at a speed of 45 miles an hour, and ordinary hills did not seem to make any difference. As I won the Liverpool contest so easily, and have also had an impromptu race with my tricycle against the Mors car, and easily beaten it, it amuses me that the Automobile Association should talk about racing the Pennington with a Mors. I should like to say a word about the Pennington cylinders. After the run I have mentioned I looked at the cylinders, and they were as cool as if they had done no work at all, and the water remained quite cool; and, if there is a motor capable of running with a small amount of water, it is the Pennington. I admit that I was most sceptical as to the work the Pennington motor was capable of doing till I had seen for myself and thoroughly tested them.

I believe I am correct in stating that I am the only one to give any idea of the speed of the Mors and Pennington, having had the chance of riding at fast speeds with both makes.

Yours faithfully,

C. G. WRIDGWAY.

Manchester, March 6th, 1899.

## EXHIBITIONS AND THE BOOM IN MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We wish to congratulate you on your bringing out your paper at such an opportune time. From the large amount of business we are doing—about three times what we had anticipated—it seems to us that there is going to be an enormous boom for motor-cars not only in England, but for foreign countries. We have booked orders for many foreign countries, but especially for the Continent. Exhibitions have, we believe, done much good to familiarise the public of this country with the motor-car, and we are sure that the exhibition you contemplate holding at the Agricultural Hall will do an immense amount of good, inasmuch as you are having a track under cover, which will draw better-class people to inspect the cars working, which they would not trouble to do otherwise.

Speaking of shows, it was remarkable to see at the Edinburgh show Messrs. Stirling booking an enormous amount of orders, and the ensuing week at the Manchester show we were again astonished at the large number of orders booked from people whom we had never come into contact with before. At both these exhibitions we had machines to enable purchasers to take a ride and test for themselves, and it is to this we attribute the big success; but at your exhibition the demonstration track will be in full view of the public, without fear of accidents resulting from people crossing their path.

Yours faithfully,

PENNINGTON & BAINES.

5 and 6 Great Winchester Street,  
London, E.C.

March 6th, 1899.

## NOTES FROM THE CONTINENT.

WE learn from Zurich that a company has just been registered in that city with a capital of £16,000, and with the title *The Schweizerische Motorwagenfabrik Wetzikon*, to acquire, carry on and develop the works and business of the *Motorwagenfabrik Wetzikon*.

LA COMPAGNIE GÉNÉRALE DES MOTO-VOITURES is the title of a company which has just been formed at Bondy (96 Rue Sainte-Medéric), France, with a capital of £4,000.

It is announced that Messrs. Benz & Co., of Mannheim, are about to take up the construction of petroleum-spirit motors of  $1\frac{3}{4}$  h.p. for motor-tricycles.

THE Dutch postal authorities have, it is reported, just placed an order with a French firm for several motor-vehicles.

THE title of the concern known as *La Nationale Société de Construction de Moteurs et Automobiles*, brevets Tenting of Paris (28 Rue Chateaudun), has been changed to *La Minerve, Société de Construction de Moteurs et Automobiles, Inventions Françaises*. At the same time the capital has been reduced from £10,000 to £8,000.

# Pneumatic Tires as Applied to Automobiles.\*

By S. F. EDGE.

IN opening this discussion I cannot help but feel that this evening we shall only touch on the fringe of this whole matter, as there are many points in connection with it which I think require the special knowledge of someone like our friend Professor Boys, and I hope that he will at some future time see his way clear to take up the subject, for the benefit of we autocarists, and add to my layman's experience that particular skill which he has applied to so many difficult problems.

The car on which the tires have been fitted to which my experience particularly belongs, is a Panhard and Levassor Daimler car, weighing when complete for the road, with oil tanks, etc., full, close on 21 cwt.

The sizes of the wheels are 36 inches and 42 inches respectively, over all; the sizes of the tires themselves  $3\frac{1}{2}$  inches in diameter, to all wheels.

The rubber of the tires has, first, an outer layer of rubber which is moulded in such a form that when placed on the tire, and this inflated, it is under very considerable compression on that portion of the tire which comes in contact with the ground.

To this is vulcanised two ply of canvas, and then there comes a thin layer of rubber over the canvas lining proper.

This lining consists of six thicknesses, and inside of this there is a very thin layer of unvulcanised rubber, so as to make a perfectly smooth surface for the inner tube to bed against.

You will see, therefore, from this that merely in the strength of the rubber and canvas there is quite a considerable resistance from flattening, in the materials of which the tire is composed, but to inflate this to a degree of hardness which I find most efficient in running a pressure of no less than 160 lb. to the square inch is required.

Whilst on the question of air pressure, I might mention the result of some tests which I made with the vehicle running perfectly free down a slope over a measured distance. Starting dead, the maximum speed was obtained with an air pressure of only 100 lb. to the square inch, but for up-hill work the most effective result was obtained with 160 lb. to the square inch, and from various tests I find that about this pressure gives me a tire with the least possible flattening under work and the least possible side roll. Either of these movements causes very rapid wear and deterioration to the tire.

Referring to the question of punctures, owing to the thickness of my tires I have never had a *bona fide* puncture, or any trouble through anything entering externally and letting out the air, so that with reasonably thick tires this risk may be put on one side as very slight.

Referring to the advantages of pneumatic tires over solids, I have never had the opportunity of making tests with instruments in regard to this; but from running on the road and very carefully noting the behaviour of the car on certain

hills, I find that I can use my car with a 25 per cent. higher gear than when fitted with solid tires. The advantage is more marked the higher the speed of the car, or through mud, as I have often run my car in company with another one of almost similar design and manufacture but fitted with solid tires. This car, however, is somewhat lighter, but is geared on each speed almost identically with my own, and whilst climbing a hard hill where there is no run on the car at all, and where the engine is only just able to run at its full speed on the lowest gear, the two cars will keep exactly side by side; but directly there is a chance of changing on to a higher speed, I have an advantage of fifty yards in a very few seconds, and as the speed increases I am able to more rapidly change on to higher speeds, and draw right away.

Quite irrespective of the advantage in draught, there is another and more important one, and that is the great ease and comfort with which the car steers with pneumatic tires. As you all know, when steering with a solid-tired car at high speed, and you run suddenly into loose stones, or even thick dust, there is a great tendency for the car to swerve. This with pneumatic tires is almost entirely obviated, and whilst at the same time on greasy roads of a certain character there is more slip than with solid tires—owing unquestionably to the fact that a pneumatic tire does not cut in like a solid tire, and therefore does not get so much grip—taking all round running into consideration, I do not find that I have any greater tendency to slip (as a whole) than with solids; and whereas sometimes a solid will slip where a pneumatic tire will not, there are places where a pneumatic tire will slip where a solid will not.

Living as I do right in the centre of London, this point, when I first had pneumatics fitted, was one that rather worried me, as I thought of the winter approaching, with slippery roads in its train. This idea has, however, been entirely dispelled, and I cannot feel that any more care is required, from a side-slipping point of view, when driving a car with pneumatic tires than when driving a solid-tired car.

When we come to the question of cost, however, there is no question that, even under the best of circumstances, pneumatic tires are going to cost us considerably more for our cars than solids.

One well-known manufacturer, whose tires I have carefully examined, makes them with a comparatively speaking small amount of rubber on the tread, and the life of the driving tire on a light car seems to be about 2,000 miles; but this life, so far as I can tell, seems to be capable of renewal for a similar distance by fitting a new rubber cover, as I can discern no signs of a canvas lining being destroyed through internal wear.

With my own tires the rubber cover, which, as you know, is particularly ample, has a life of quite 6,000 miles, and, with care in filling up all cuts, I would say another 1,000 or 2,000 miles.

My trouble, however, has not been with the rubber cover, but with the lining, as, owing to the enormous air pressure to which the tire has to be pumped to be hard enough to sustain the weight of the car, the canvas lining seems to have a life varying from 2,000 to 3,000 miles only, and at this period it is liable at any time to crack exactly at the point where the bellows-action, if I may so term it, takes place, and, of course, a burst tire is the result. Consequently a new lining is

\* A Paper read before the Automobile Club of Great Britain.

required, which costs about £3 6s. for the driving wheels and £2 11s. for the front wheels.

Now, of course, the effect of this bending action could be greatly minimised, as in a cycle tire, if the canvas lining was, say, of only two layers, as the curve that the canvas would have to take at the bend would not cause so great a strain on the outer layers of the canvas; but then comes the question that as the canvas walls are reduced in thickness, so their strength to stand up under pressure is reduced, unless increased air pressure is put into the tire.

Moreover, it is found in practice that two layers of canvas are not strong enough to stand the enormous air pressure, so that we are now face to face with this difficulty: first, if we have the tires thin, so that the bending will not hurt them, the internal pressure of air will destroy them; and second, if we make the walls thick, so as to withstand the internal air pressure, the number of layers of canvas necessary to do this constitute a danger in themselves, and destroy one another, beginning from the outside, because of the great strain thrown on the outer layers.

I am therefore now trying another experiment of which I hope to give you the benefit of my experience at a later date, and this is to do away with the necessity for such an enormous air pressure.

This I can do in two ways: First, by making the inner tube exceedingly thick, say half an inch, so that the air has quite an amount of work to do to merely distend the inner tube, thus utilising a considerable amount of the air-pressure in distending the inner tube rather than in trying to burst the inner lining. The disadvantage of this method, however, will be that such a large amount of rubber will have to be used in the tire that its cost will be greatly increased. The second method, which I have actually tried, the results of which I will tell you, and which, I think, will surprise you, is to have the tires filled with gelatine, pumped in, of course, when hot and liquid, and of such a consistency as to set in a firm jelly, and, of course, under great pressure, so as to sustain the necessary weight.

These tires, owing to the jelly, add no less than 31 lbs. to each wheel, but, curiously enough, after most careful tests up known hills, give me results equally as good as pneumatic tires pure and simple, and I was quite charmed with the idea; but I found that down hill—and, of course, the same remarks apply to a certain degree to running along a level at a high rate of speed—the efficiency fell off in a very marked degree.

The nett result of my experience was that up to about fourteen or fifteen miles per hour I could detect no loss of efficiency as compared with the pneumatic tires, but, curiously enough, a far more smoothly-running car; but over this speed I noticed a loss of efficiency, and the faster one went the greater the loss.

I can only put this down to one thing, and that is, that, as you all know, as the wheel runs there is, as it were, a wave formed, which is given out again at the back of the tire. This, in a tire filled with air at a high pressure, gives an exceedingly quick return at the back of the tire, so that it to a certain extent minimises the loss consequent on making the wave in the front of the wheel; but in a tire filled with jelly this return is not sufficiently rapid when travelling fast to give back what one has lost until after the tire has left the contact of the ground.

Perhaps, however, Professor Boys can assist us in this direction, and explain what is, at any rate at first sight, a little curious.

Of course, another very great advantage of pneumatic tires is the way in which they reduce the noise on a car when running—firstly, from the road jar, and secondly, because they seem to deaden the sound of the engine.

Going back again for a moment to my not having had the opportunity, so far, of trying a material sufficiently thin and flexible to prevent damage through bending and still of

sufficient strength to stand the air pressure up to whatever is necessary to support the weight of the vehicle, I hope shortly to have a pair of tires made on purely cycle lines, that is, with tangential fabric, exactly similar to cycle tires, but of course with the fabric of far coarser material to stand the extra work.

The threads of this material have to convey the power from the rim to the road, and it will be obvious that if this power can be conveyed through the straight lines of the fabric, which, as you will know from the section, are quite straight, or rather parallel with the driving force, it is far better than conveying the power through the wavy threads which go to make up canvas, owing to the interweaving of the weft and the woof of the canvas, as directly the strain comes upon the latter these threads have to be pulled tight before the power is transmitted, whereas with the fabric there is no slack to be taken up.

In bicycle tires the difference between a tire made with fabric and one with canvas is at least three miles per hour, and the difference in efficiency quite, I should say, 20 per cent., so that when we come to heavy vehicles, such as our automobiles, the gain should be quite as much, if not more.

Another advantage in its favour is that fabric, when meeting an obstacle, will depress particularly at the point of the contact, and the depression will spread very little away from that portion of the tire that is pressing on the obstacle; but when one depresses a canvas tire the area of depression continues for quite a considerable distance on either side of the point of contact, thus making it very difficult for the obstacle to sink into a tire pumped to a pressure identical with the fabric-lined tire; so you will follow from this why I am hoping for much better results from an efficiency point of view if a fabric tire can be successfully made.

Referring to the advantages of pneumatic tires as applied to automobiles, these at present are:—

First.—Greater power and speed with same type of car, particularly speed, than is the case on a car with solid tires.

Second.—Improved steering of the car.

Third.—Reduction of noise.

Fourth.—Reduction of vibration.

Fifth.—As there is reduced vibration, so there is increased life to the car.

Sixth.—And one which I think is as important as all, but which, of course, is personal, that having once used pneumatic tires you do not enjoy driving on solids, for the same reason as a person having once ridden a pneumatic-tired bicycle would almost prefer to go for a walk rather than ride a solid-tired machine.

The disadvantages at present are:—

First.—Heavy initial cost.

Second.—Comparatively speaking short life as compared with cost.

Third.—Increased risk of accident when en route.

With these points before you, gentlemen, you will probably one and all form some idea of what the ideal tire must be, but in this I will forestall you by giving you the points which I think must and which I think will eventually go to make up the ideal tire for automobiles.

First.—A tire that will run on the driving wheels 10,000 miles if kept properly blown up and the cuts attended to.

Second.—A tire which if punctured is easily repairable. By easily I mean one that can be taken off, repaired, put back and blown up again inside of fifteen minutes by the ordinary user. This, I think, for an automobile tire would not be harassing, as the trouble should seldom occur.

Third.—A tire which is absolutely perfectly attached to the rim, and cannot leave the rim if it becomes deflated whilst running down hill, but must be deliberately removed by hand.

- Fourth.—A tire which, if run on for a few miles when deflated, will not be irretrievably damaged.
- Fifth.—A tire with the greatest amount of air space and consequent comfort, in comparison with the external diameter of the tire.
- Sixth.—A tangential fabric tire which will convey the power from the rim to the road in straight lines with a minimum amount of loss.
- Seventh.—A rubber cover under compression when in contact with the road, so that cuts close up and do not gape.
- Eighth.—A valve which is mechanically attached to the inner tube without solution or vulcanisation.
- Ninth.—A valve which is an absolutely automatic non-return, without rubber or any perishable material in its construction, and which also has a mechanical device for making it air-tight, to act as a safeguard to the automatic device.
- Tenth.—A pump which will do its work with the least number of strokes, and with the least loss of air per stroke, without at the same time requiring a Hercules to push the plunger down at every stroke.

### THE DISCUSSION.

Mr. H. J. Sturmeys said Mr. Edge's paper had completely covered the question, and his experience had largely corroborated his (the speaker's) own views as deduced from experience of cycle tires. He had not had the opportunity of much experience with pneumatic tires on motor-cars, because there were very few, except the motor-cycles, fitted with pneumatic tires in this country, owing to the great expense. He knew that makers on the Continent were absolutely in favour of the pneumatic tire, and in Paris and Brussels it was considered that pneumatic tires made a difference of 25 per cent. in the running of the machine. That was a great deal, and yet he was inclined to think, especially with the heavier vehicles, that the gain must be near the figure quoted, because it was of such a sweeping kind—in the life, the power, the absorption of vibration, and the consequent lessening of the work to be done in propelling the car. The experience of those on the Continent who had used and are using pneumatic tires very largely was not favourable if the expense was considered, for it was an undoubted fact that those who availed themselves of the benefit of these tires had to pay for it. Mr. Edge had set forth a good ideal, and if they were to get tires to be depended on to stand 10,000 miles of ordinary running, people would not hesitate about the expense, although even then it was a considerable item. At first sight he should have been inclined to think that pneumatics would slip considerably more than the solid; but Mr. Edge's experience was that upon a motor-car the tire acted almost the same as on a bicycle. The point as to the advantage in steering was a distinctly good one, which he had himself noticed in the two or three cars fitted with pneumatics that he had tried. In the small Daimler experimental car fitted with pneumatics and steered by an 8-in. wheel, the slightest movement of the hand steered the wheel. There was no strain, no kick back, and the steering was practically perfect. Probably no man in this country had gone so fully into the points of manufacture as Mr. Edge, and he was glad to see the recognition of the tangential fabric. If an air-tube could be got without canvas or bending material which would hold a column of air, a faster tyre than that of to-day could be obtained. That was an impossibility, and therefore they would have to be content with getting as near that point as possible, and he who got nearest would win in the end.

Mr. F. R. Simms said he had recently made some experiments with regard to pneumatic tires, and hoped to shortly show them a tire approaching the ideal. He had found that in many cases the side slip was very excessive in motor-cars when pneumatics were employed. In the forthcoming exhibition he hoped to show a tire to stand at least 6,000 miles, which was easy of repair, and which had an interchangeable tread. Mr. Simms referred to the experiments made by Professor Hewins, of Cambridge, who had found that the rolling resistance of pneumatic tires on a smooth surface was almost entirely *nil* compared to the velocity. That ought to be borne in mind when building a new tire.

Mr. MacLulich thought the inflation of the pneumatic tires should be increased according to the weight of the car. If the latter was very light the tire should not be inflated so hard as it would be for a heavy car. That was best judged by the hinging action from the tire. A tire that was inflated sufficiently would not show any bulge at the point of contact with the ground, and it might not be necessary to inflate it to the pressure of 160 lbs. He did not see that increasing the number of layers of canvas would add to the tendency for the tire to act as a hinge if it were built up in the proper way, *i.e.*, if the outer layers were built up in the shape it would take on the rim, so that the outer layer would be larger than the inner one. Fabric was better than canvas, but he did not see that the number of layers would interfere with the running of the tire.

The inner tube as now made was liable to burst in a tire without the tire bursting, owing to its being too thin. If it were a thick tube there would be no difficulty, because it would be able to stretch a little without bursting. As regards the compression on the outer tread he suggested an endless compressed band or tread to be fitted over a thin cover, which could be easily and cheaply renewed, and which would have no joint to open.

Mr. Hemming dealt with the point raised as to solid tires giving the most slip on a stony, rough road and the pneumatics giving more slip on a greasy road. This he did not think was very extraordinary. On the stony road the solid tire would not absorb a stone, but would hit it; and unless it hit it on the centre line it would slide off and give a tendency to the side slip. On the other hand, a pneumatic tire would probably absorb the stone, even if it did not hit it exactly in the centre. The reason that a greasy road gave more slip to the pneumatic tire was that the surface when turning the corner was somewhat increased, and was not increased to any appreciable extent with a solid tire. When the pneumatic tire pressed on the road an elliptical surface was formed, but it was not so distorted in the solid tire, because it would not give, whereas in the pneumatic it would be flattened. When a side thrust was given a bigger surface was obtained, and with that larger surface and constant weight there was less friction than in the case of a less surface, also lubricated as it would be on a greasy road. Therefore, they need not be surprised to find that the pneumatic tire had more slip on a muddy road than on a stony one. With regard to the bending of the canvas, he pointed out that fabric could be bent about without being injured, but if a piece of indiarubber was bent against a hard steel rim friction resulted. A canvas tire would stand a very considerable strain—more than the rubber one would. To get rid of these conditions they would have to combine a solid tire with a pneumatic tire. That could be done, and, as a matter of fact, was done, but he was not at liberty to speak about it.

Mr. Lyons Sampson referred to his observation of cars fitted with solid and pneumatic tires respectively, and it seemed to him that the slip of the pneumatic tire was actual, *i.e.*, it slid over the greasy surface, whereas with the solid tire it was, in a great many cases, only apparent. If the car was going on the side of the road or turning round a corner, there was a side tendency or strain that bent the rubber over. As the wheel kept rolling on, it rolled from the strained rubber on to the unstrained, and that yielded without any actual skidding on the surface of the road. There was a very marked apparent slip, and he had stopped the car and gone back to examine the track to find that this was the case. When he had found the car slipping that way on a dry surface he had watched the front wheel, when it was quite apparent that it was through the bending of the rubber. The wheel kept rolling from the strained to the unstrained rubber, and without actually slipping the car made considerable side way, and in cases where there was only fourteen or fifteen inches to spare the kerbstone might be touched.

Mr. A. Bird pointed out that they had got to look at a pneumatic tire as being built up of parts—one, the inner or tube, another the fabric which retained it, and the other the tread, which at certain intervals should be renewed. He had had experience with pneumatics on horse-drawn vehicles, and the results were most satisfactory, particularly as regards their durability. There were several reasons why pneumatics were apt to wear out quickly on motor-cars where the strain of driving the vehicle was added to the rolling action of the front wheel. It had been found necessary to have a certain number of layers of canvas fabric, and when the car was being driven the strain had this tendency upon the canvas—that the threads which were parallel with the wheel were stretched very tightly in order to get the power to the driving wheel. They were drawn over the threads running at right angles, and a sawing action set up until the cover began to give way, and ultimately burst. The threads should be laid inside the rubber, forming the cover of the tire, and should be insulated, and not in contact one with the other. He had a motor-car with pneumatic tires, and had not found the side slip very serious in ordinary driving. There was a distinct advantage in running over tram lines with pneumatic tires. Solid tires sunk into the rails, and there was thus an increased danger of side slip, but the pneumatics left them easily.

Mr. C. Jarrott confessed to having had a partiality for solid tires until he had been converted to a belief in pneumatics by trying Mr. Edge's car. They had heard of the difficulties attending pneumatic tires, but there were also troubles associated with solid tires. He had known them to come off, and related a personal experience in Buckinghamshire when the solid tire of his car sunk into a rut which had been filled in with loose gravel. On the question of surface on the road, a French manufacturer had told him that the tires should be pumped sufficiently hard for the weight of the car, that not more than half an inch should rest upon the road.

Mr. Vernon Beaumont thought the Club was very much indebted to Mr. Edge for his valuable paper. What was wanted to get a perfect tire was the greatest amount of freedom for the perfectly elastic air contents of the tire. Every thread of the fabric should be placed in a position to receive and transmit the strains and, at the same time, be in a satisfactory position with regard to the air pressure. Speaking on the width of the tires, he said iron tires running on a muddy road, the mud of a rather fluid character, gave just as good results whether wide or narrow, but if the mud was a little thicker and more viscous, narrow tires would be better than wide ones. He was inclined to think that some of the experiments were a little masked in their real meaning by the difference in the width of the pneumatic and the solid tires. There were many other useful

points in the paper—the facility of taking off and putting on again the thick or thin tire, and the wear of the canvas, not only the inside structure of the tire, but that actually next the inflated tube, etc. Mr. Edge deserved their thanks for his extremely useful suggestions, which would no doubt lead to further consideration of the subject.

The Chairman (Professor C. Boys) congratulated the Club on the paper by Mr. Edge. He was interested in the statement that after running some distance with one tire fully pumped and the other loose, the latter was quite hot from internal friction. Due regard to heat should always be observed. If they were trying to get work in an engine from heat, a very small proportion of the heat employed could appear as work. So that when a tire got hot it should be known that, at least, an equivalent of that heat had been spent as real work, resulting in waste, besides being terribly destructive to the tire. Mr. Edge hinted at a thing being right in theory and wrong in practice. Such was impossible, for if it was right in theory, in every detail—if, in fact, it was perfect—it must be right in practice. Otherwise the theory was wrong. It was surprising to hear that the advantages of modern pneumatic tires as applied to bicycles and other cycles had not been made use of in tires for motor-cars. The two problems were identical, and he did not understand why those who made tires for the heavy machines should not take advantage of the experience gained by those who provided for the wants of cyclists. A few years ago the heavy air-pressure to which Mr. Edge referred as being held in thin rubber or canvas would have been regarded as impossible. And yet such was accepted to-day. But if these high pressures were to be seriously dealt with, the question arose as to whether they should follow precisely the practice of the maker of bicycle tires in placing the layers of threads at angles of 45 degrees to the rim. He asked whether, if they were going to take six layers of fibres, two, three, or four should not be placed at right angles to the line of the rim, so as to withstand and not be concerned in transmitting the driving force at all, and the remaining two or three portions of the fabric at 45 degrees as before. Or it might be more convenient to put all the threads at an angle of 70 or 80 degrees.

Mr. Edge, replying to the discussion, pointed out that in the Paris to Amsterdam race the solid-tired cars were unable to go through. With regard to side slip it was slower on a pneumatic than on a solid tire, and there was often plenty of time to correct it. His car once turned completely round on to a cabman, who was so taken by surprise that he ran into another cabman, and then wished to argue with the driver of the motor-car. (Laughter.) It was a curious experience, and the only time the car had taken control of him. Evidently there was some kind of lubrication on the road, which gave no grip at all. He had fixed 10,000 miles for his ideal tire, because then a tire was provided that would cost no more than a solid one. He felt there was a great deal in Mr. Lyons Sampson's observation of the apparent slip, and it was the "give" in the rubber that constituted the danger, making the driver think something was wrong. Pneumatic tires on motor-cars had not been a success because they had not been kept pumped; that was apparently too much trouble. With regard to tires, it would be perfectly reasonable to tell the manufacturers that they wanted the fabric of the tire for the front wheel with threads at a different angle to that of the back wheel, as each wheel had different work to do. He favoured a thin outer cover. Solid tires were worn away, but pneumatic tires had little or no wear on the surface from actual running. The rubber cover was destroyed through the cutting effect of stones. The eventual outcome of automobile cars would be the introduction of larger tires requiring a less pressure of air. The suggestion of Professor Boys for a tire that would take a driving and bursting strain independently was a great step towards a perfect tire. Those two heavy strains should be provided for in independent ways, and each layer would then do some useful work.

A vote of thanks to Mr. Edge having been adopted by acclamation, a similar compliment to the Chairman brought the interesting proceedings to a close.

MR. J. WALWYN WHITE has accepted the position of honorary treasurer to the Liverpool Self-Propelled Traffic Association, which body is also the local centre of the Automobile Club of Great Britain and Ireland.

WE learn that the Newport Pagnel and Olney motor-car service is so successful that it is contemplated to establish another service between Newport Pagnel and Bedford, a distance of 13 miles.

NORTH AMERICAN AIRMOTOR Co., New York, has been incorporated in West Virginia, to manufacture and sell apparatus operated by compressed air, steam or electricity. Authorised capital, \$1,000,000.

THE American Automobile Co. has been organised at Portland, Me., U.S.A., for the purpose of manufacturing and dealing in waggons, motors, dynamos, generators, and other electrical machinery, with \$250,000 capital stock, of which \$600 is paid in.

## PROSECUTION FOR FURIOUS DRIVING IN BRADFORD.

AT the Bradford City Police Court, on the 6th inst., Robert R. Jackson, of 73 Horton Lane, secretary of the Yorkshire Motor-Car Company, Limited, was summoned before the Stipendiary Magistrate (Mr. C. Skidmore) for furiously driving a motor-tricycle. Police-Constable Marshall stated that on Saturday afternoon, February 25th, his attention was directed to the defendant, who was driving a motor-tricycle at an excessive speed. The defendant travelled round the Town Hall a number of times; a large crowd assembled, and there were several narrow escapes. Witness stated that he took observation of the time occupied in passing from one point to another, and afterwards measured the distance. He found that the cycle travelled 250 yards in 30 seconds, or at the rate of seventeen miles an hour. The defendant admitted the offence, and explained that he was testing the brake power.—Mr. Skidmore: Good gracious! Testing brake power round the Town Hall!—Defendant: It was perfectly safe.—Mr. Skidmore: It was safe for you, but not for other people. The road is meant for everybody, but people with carriages and bicycles seem to think that they have a monopoly.—The constable's evidence was corroborated by Mr. Henry Bright, tramways manager, who said that he was driving at the time, and that if he had not pulled the horse upon its haunches a serious collision would have occurred.—The Deputy Chief Constable (Superintendent Byng) stated that numerous complaints had been received respecting the furious driving of motor-cycles in Manningham Lane.—Defendant: It was a new motor, and I was, perhaps, overjoyed with the success of it.—Mr. Skidmore: These gentlemen were not overjoyed. Most valuable lives are sometimes contained in the Town Hall. (A laugh.) It is quite dangerous enough crossing the square with the tram engines, without any new terror being added.—Mr. Skidmore proceeded to caution the defendant that any future offence would be severely dealt with. It was intolerable that motor enthusiasts should use their machines in such a manner through overjoy, and to the danger of the public.—A fine of 10s. and 12s. costs was imposed, with the alternative of ten days imprisonment.

## NEW COMPANY REGISTERED.

### AMERICAN AUTOMOBILE AND MOTOR COMPANY, LIMITED.

THIS Company was registered on February 28 by Snell and Co., 1 and 2 George Street, Mansion House, with a capital of £80,000 in £1 shares (60,000 preference). Object: To carry on in all or any of their respective branches the businesses of electricians, engineers, machinists, builders of and dealers in carts, waggons, motors, cycles, and vehicles of every description; omnibus proprietors, carriers, etc.; to acquire and turn to account any real or personal property. The signatories are:—

|   | Shares. |
|---|---------|
| F. L. Gardner, 32 Jewry, E.C. ....  | 1,000   |
| S. B. Schlesinger, 169 Boulevard Malesherbes, Paris, gentleman ..             | 1,000   |
| P. Soberano, 29 Avenue de la Grande Armée, Paris, gentleman ..                | 1,000   |
| Viscomte Perrault de J. de Feuillasse, 1 Boulevard Point Bugeaud, Paris ..... | 1,000   |
| R. de la Ville le Roulx, 50 Avenue Marceau .....                              | 1,000   |
| R. C. Aldrich, 47 Boulevard Haussmann .....                                   | 1       |
| F. C. de Soul, 47 Boulevard Haussmann .....                                   | 1       |

The number of directors is to be not less than three nor more than seven. The first are F. L. Gardner (chairman), A. Geiger (vice-chairman), S. Schlesinger, R. de la Ville de Roulx, Baron P. de Vilaine, and P. Soberano. Qualification, £1,000. Remuneration, £500 each per annum.

## ANSWERS TO CORRESPONDENTS.

- E. SHRAPNELL SMITH.—Many thanks for information and expressions of goodwill.
- R. M. BODDY.—Your suggestion shall receive due consideration, but we fear it is impracticable.
- J. R. M.—Thanks for information, which you will find duly commented upon in this issue.
- "DISGUSTED."—You are by no means the only purchaser of these vehicles who has complained of the same matter. You cannot possibly do better than put yourself in the hands of Messrs. Connolly, who are personally as obliging as they are prompt in attention.
- F. J. MILLAR.—We shall be glad to hear from you when your projected tour is completed. We have forwarded to the address given the desired particulars, and thank you for your interest.
- "ALCOHOL."—So far as we know, no attention has been paid to the subject in England. Its use would be more expensive, but freedom from odour of the exhaust gases is gained. Relatively the power gained is less.
- F. W. B. (Penge).—Thanks for good wishes and promise of assistance, which will be valued. We have written you.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, MARCH 17th, 1899.

[No. 2.

Published by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### Ourselves once more.

WE are extremely loth to intrude in these columns once more, but unfortunately necessity compels us to refer once again to personal matters. We are extremely proud, and exceedingly grateful to the many friends and acquaintances, and the still more numerous entire strangers, who have written us congratulatory letters in regard to the first issue of *The Motor-Car Journal*. The terms of praise used in their letters made us blush for the reason that we are greatly afraid they are really undeserved. We were, ourselves, by no means satisfied with the first issue of our Journal, and it has therefore astonished us that so many kindly-disposed persons have been so thoughtful as to send us words of encouragement. Will these gentlemen, numbering considerably over 200, kindly accept our thanks, as here conveyed? It is beyond our power to reply to all personally, and we trust that this public appreciation of their kindness will be accepted. For our own parts we are utterly astonished at the reception the Journal has received. We knew we were dealing with friends, so to speak, but the number of these friends who have purchased and ordered our Journal regularly astonishes us. Again we tender our thanks, and trust to deserve more fully in the future the commendations showered upon us.

### The Motor-Car "Horn."

OF all the so-called "objectionable features" of the motor-car from the public's point of view perhaps the "trompet" or horn is that most objected to. It is unfortunate that so horrible an instrument has been generally adopted by automobilists both in France and in this country. Unfortunately, however, some distinctive sound had to be found, and the quite distinctive tones of this instrument immediately appealed to those responsible for the introduction of motor-cars, with the result that the "trompet" has been generally adopted. The novice or amateur certainly uses the horn much more frequently than the expert, and this occasionally leads to his undoing. It is our own experience that horses are much more frequently startled by the sound of the horn than by the noise of the approaching or passing motor-car. The novice, or young amateur, having used the horn to such an extent that the horses in his vicinity are startled and become partly beyond control, is in an infinitely worse state than the expert under similar circumstances, for the nervousness of the novice will perhaps lead him into further difficulties, whilst the expert, knowing the capabilities of his vehicle, extricates himself with confidence. The law compels the blowing of the horn or the giving of some similar signal under certain circumstances, but beyond this, to avoid trouble and to save annoyance, it is advisable that the horn should be used as little as possible. Speaking generally, it is the bad driver who uses the horn most, and so brings motor-cars into disrepute by creating unnecessary alarm to other travellers. In overtaking a horse-drawn vehicle it is best to sound the horn when some distance behind, and so soon as it is seen that the signal has been noticed to avoid its

use again until past the "hippomobile." Of course it is sometimes necessary to use the horn when quite close to a horse-drawn vehicle—for instance, when it unexpectedly turns out across one's path; but even on such occasions two moderate and short blasts are generally sufficient to warn the driver.

### Torquay and its Motor-Car Service.

CERTAIN inhabitants of Torquay—that centre of almost rabid conservatism—are "up in arms" at the "furious driving" of motor-cars along the Strand and the Torbay Road, whilst others are also "up in arms" against the "design and appearance" of the car. As regards the design we understand that they are *chars-a-bancs*, designed to carry nine persons, propelled by 4 h.p. nominal Daimler engines, and speeded only to twelve miles per hour on the fast speed, so that "furious driving" would not appear possible, excepting the streets were overcrowded, which is not alleged. One correspondent in a local paper asks: "Why should Torquay be chosen as an experiment for these cars in their present crude and unfinished condition?" But the correspondent does not allege that the cars are inefficient, nor that they show any faults in travelling. The truth of the matter is that the inhabitants, or rather natives, of Torquay are so used to battenning and feeding on visitors, and so religiously keep in their own hands any and every possible means of "bleeding" visitors, that they resent the advent of any "outsider" who seeks to derive a profit from those preserves which they look upon as their own. If the cars had been run by a local man, or a body of local men, all would have been well; but unfortunately they are run by a London firm. Hence these tears!

### A New American Motor-Car.

AMONGST the latest American productions in motor-cars is a new form of petroleum-spirit vehicle, built on what may be termed a "compound dog-cart" form, and carrying eight passengers. The weight of the vehicle, with cooling water and spirit on board for 150 miles travel, is said to be 2,570 lb. The motor is of 7 h.p., its two cylinders being placed horizontally, and the piston rods working on to one crank set at 180 degrees. Electric ignition is employed, and for starting the motor a compression release is provided. The speeds are set at from 4 to 20 miles per hour, the speed variation being obtained by a system of friction clutches, with belt and chain transmission devices, controlled by a lever at the driver's side. Additional variations of speed are attained by advancing or retarding the ignition. With a load of 1,800 lb. this car has attained a speed of 18 miles per hour, whilst on a low-speed a 10 per cent. gradient was climbed. The fore-wheels rest on pivoted hubs, and not on the usual vertical axles. Two brakes are provided, and the differential gear is placed on the intermediate shaft. The frame is of channel steel. This vehicle is the production of the Best Manufacturing Co., of San Leandro, California, U.S.A.

### A Long "Non-Stop" Run.

MR. PEDLEY, of the London Motor-Van and Wagon Company, Limited, recently had a fine run from London to Clacton-on-Sea, a distance of seventy-two miles, without stopping to take in cooling water. This distance was accomplished during the night in five hours and ten minutes in a *char-a-bancs*, he being the only passenger. Until Romford was passed his journey was considerably interfered with by the market carts proceeding to London. The top speed gear of the car was only twelve and a half miles, but, of course, Mr. Pedley "dropped" the hills. The water supply carried was eighteen gallons, and of this quantity six gallons remained on reaching his destination. Four gallons of petrol were carried, but sufficient remained at the end of the run to drive the car another eight miles. Mr. Pedley states that this was the most enjoyable of the many long runs he has negotiated, and we can quite appreciate his pleasure and enjoyment in the trip. Can any of our readers give an instance of a longer "non-stop" run?

### Steam Turbines for Motor-Carriages.

AN ingenious writer in a contemporary has suggested the use of steam turbines in connection with motor-carriages. He complains of the vibration of the petroleum motor, and thinks the adoption of the steam turbine would be an advantage. Unfortunately the writer in question does not quite appreciate the problem. Many attempts have been made to design a rotary impulse or explosion engine, but none have been commercially successful. In regard to carriages fitted with steam engines there has been no complaint as to vibration arising, whether the engines have been of the vertical or the horizontal type, or whether simple or compounding. Indeed, it is difficult to see how any noticeable vibration could ensue with an expansion engine. The turbine is, therefore, not especially needed, and besides would hardly be efficient unless working under some such tri-compounding method as in the Parsons turbine. The whole problem to be solved in steam-carriages is the generator, the automatic and positive control of the generation of the steam, the control of the fuel or evaporating agent, and the avoidance of the emission of waste gases (smoke) and excess and exhaust steam. We do not think even Mr. Parsons, say, would consent to endeavour to solve the problem of driving his excellent "Turbinia" without emitting any smoke, and without allowing his steam generators to "blow off," no matter how sudden the stoppage of his engines or how sudden the demand for steam to drive them again. The writer in the *Irish Field*, will, we trust, appreciate these difficulties, and, whilst continuing to offer experts the undoubtedly valuable suggestions of his fertile brain, will, we hope, take into consideration these and other problems of road locomotion as governed by law before attempting to "dump" a steam turbine on a motor-road vehicle.

### Winding-up of the London Motor-Car Works Company, Ltd.

A WINDING-UP order having been recently made against this Company, meetings of the creditors and contributories were held on the 14th inst. at the Carey Street offices of the Board of Trade. Mr. Cully, Assistant Official Receiver, who presided, reported that the Company was formed in November, 1896, with a nominal capital of £10,000 in £1 ordinary shares, to acquire for £4,000, payable in shares, a licence and privilege to use a patent relating to gearing and speed controlling of motor-cars, and to make and sell motor-cars. The invention was not perfected when the licence was acquired, and experiments were carried on under the supervision of Mr. J. R. Rickards, the vendor, who was appointed as managing director, with a view to perfecting it before placing it on the market. A

prospectus was issued privately to friends of the directors, but only 1,800 shares were applied for and allotted in response thereto. Premises were taken at Hammersmith, and plant and machinery were laid down at a cost of £1,329, but six months after the inception of the Company the working capital became exhausted, and the works had since been closed. An arrangement was entered into by the Company with the Cycle-at-Home, Limited, to manufacture home trainers for the Company, but only fifty machines were completed before the stoppage. Accounts had been filed under the liquidation showing debts £727, assets £978, and a deficiency of £5,563 to the shareholders. The matter was left in the hands of the Official Receiver to be wound up by him in the usual manner.

### Motor-Car Service at Swansea.

IN the course of last week, at the invitation of the directors of the Swansea Motor-Car Company, a party of ladies and gentlemen assembled for the purpose of inaugurating the Company's service of cars by a trip to the Mumbles. Amongst those present were Mr. John Williams (Clayton), chairman of directors, Mr. Ernest Leeder, Mr. J. C. Morris (Swansea), and Mr. William Morris (Pontypridd). Two motor-wagonettes were used, and the party were taken to the Mumbles and back to Swansea by way of the steeper gradients of Sketty. The trip went off without a hitch of any kind. A half-hour service is being arranged between Mount Street and Sketty. The greatest interest was manifested by the public on the route of the trial trips.

### Motor-Vehicles in Boston, U.S.A.

IT is reported that the Mayor of Boston, U.S.A., is experimenting with two types of motor-wagons with a view to their ultimate adoption in the municipal service, especially for sanitary, cleansing, and paving works. Boston already has motor-fire-engines, but from all accounts these have not proved so successful as to encourage the belief that horses will be entirely superseded for the purpose of drawing fire-engines. In the meantime the Mayor has caused two types of vehicles to be ordered, and experiments are to be commenced with them at once. Ultimately the municipality hopes to build its own vehicles, buying certain parts, such as engines, etc. Increased interest is being taken in motor-cars in the United States, and Buffalo is now calling for motor-cabs and carriages.

### Motor-Car Service in Scotland.

A LADY correspondent domiciled in Scotland, in writing a complimentary letter to us on *The Motor-Car Journal*, mentions incidentally the pleasure derived from several journeys in motor vehicles in Scotland. She further adds that in her view there is a vast field for public motor-car services in Scotland, and an even greater one for private hirings from jobmasters. In these views she is supported by our regular Scottish contributor, who in his "Notes" this week gives expression to almost identical views. It is thus evident that our contributor is not over-estimating the public desire for facilities for hiring motor-vehicles.

### Motor-Cars in Capetown.

SOME time ago Mr. Liebmann, the Capetown representative of the South African Express Company, was in England purchasing cars for service in South Africa. At the time of his visit we had the pleasure of several interesting chats with him, and he then prophesied that within a short time the Colonial Postal Department would entrust the delivery of mails to his firm by "motor-car express." His prophecy has been fully fulfilled, and the service has been so successful that the three wagonettes and a parcels van

taken out by him for his Company are to be supplemented by several additional vehicles to be built by the same firm that supplied the first, the Motor Manufacturing Co., Ltd.

#### Motor-Ambulances in Canada.

CANADIANS are moving apace in automobilism. In fact, so great is the advance that even the Police Commissioners of Toronto are taking up the subject in the open spirit that characterizes all dealings in the North-West. The latest scheme for the utilization of motor-vehicles is the provision of motor-ambulances. Hitherto both manual and horse-ambulances have been used, and it is now suggested that the hippomobile conveyances shall be discarded in favour of electrically-propelled ambulances. The Board of Commissioners are most favourably disposed towards the suggestion.

#### Trials of the New Benz Car.

ON Saturday, soon after mid-day, we were surprised to see several Benz cars making their way towards Surrey, and noticed amongst the passengers on these cars Mr. Dowsing of the Pretôt Motor Syndicate, Mr. Hewetson (Hewetson, Ltd.), Mr. F. C. Blake, of Hammersmith. Ultimately we learned that Mr. Hewetson intended to try the new Benz car fitted with epicycloidal hill-climbing gear on a "stiff" hill at Guildford, just outside the town. One informant told us this hill was a "mountain," and another that it averaged a rise of 1 in 4 the whole way, and another that it was the stiffest hill known near London. Messrs. Hewetson, Ltd., after the trials very kindly sent us an account informing us that the vehicle, conveying three persons, had ascended the hill in question most successfully. They also informed us that the congregated motor-carists, riding in ten cars, ultimately proceeded to the "Anchor" at Ripley, and from thence to their various destinations. This new hill-climbing gear of the Benz car gives one turn to the road-wheels to every thirty-five revolutions of the motor, and its speed of travel would therefore appear to be about 2½ miles per hour under the best conditions. Messrs. Hewetson unfortunately omitting to give us any data concerning the hill surmounted—the Mount—we had to make enquiries elsewhere, and in order that there might be no disputes, over-estimations, denials, and the usual conflicting statements, we appealed to the Borough Surveyor, Mr. C. G. Mason, A.M.I.C.E., who with his usual courtesy replied as follows:—

"The gradient of the 'Mount' is 7·8 for the first part of the hill, and the remainder varies, giving an average of 1 in 16."

We invite Messrs. Hewetson, and also all other makers, to give us previous notice of any such trials, and we will endeavour to have a representative present thereat.

#### Electrical Ignition Devices.

ALL users of motor-cars working on the electric ignition system, know how absolutely necessary it is to have a thoroughly dependable induction coil and sparking plug; many users also know how difficult it is to obtain these devices. Unfortunately, there is an impression in some quarters that if a coil gives a long spark the desideratum is reached; that this is not so any electrician will admit. The length of spark is practically immaterial so long as a flaming spark is produced. The long blue spark will unfortunately not ignite the charge when heavy compression is used, and what is really wanted is a "fat" flaming spark. So far as we have been able to ascertain, Mr. Blake, of Dalling Road, Hammersmith, has devised one of the best ignition coils yet on the market. It gives, even with an E.M.F. of 2 volts., a "fat" spark that almost instantly ignites a piece of cold match stick, and when an E.M.F. of 4 volts. is used the wood

is positively lighted instantaneously, even when quite cold. These coils are fitted with large platinum contacts, and will stand the heavy and continuous work inseparable from igniting the charges in high-speed engines. The secondary winding is amply protected, and the condenser is made with the utmost skill. Sparking plugs of many types also give some amount of trouble, and Mr. Blake, in putting his plugs on the market, has done wisely in discarding the "ring" device and in adhering practically to perhaps the most successful ignition plug known, that of De Dion and Bouton. He has provided, however, slightly longer insulation, and his plug is certainly the best we have seen of English manufacture, and surpasses very considerably many of those made on the Continent.

#### Visit of an American Motor Expert.

WE understand that Mr. Hiram Percy Maxim, one of the staff of the Pope Manufacturing Co., makers of the "Columbia" electric-carriage, was recently in England making enquiries in regard to the hydraulic speed gearing, the invention of Mr. Hall, with a view to its adoption in the vehicles of the Company he represents. Mr. H. P. Maxim has for many years been experimenting with petroleum spirit motors for motor-vehicles, and we have in our possession a photograph of him holding in his hands probably the lightest twin-cylinder petroleum spirit motor ever made. Probably no single person in America has worked more assiduously than Mr. Maxim in endeavouring to solve the extremely complex problems of mechanical road-locomotion, his attention being given to all the descriptions of power, but principally to impulse engines and electrical motors, whilst steam and compressed air have also been his study.

#### "The Horseless City."

AN extremely interesting paper having for a title the somewhat far-fetched heading of "The Horseless City, or the Age of the Automobile," was recently read by Mr. A. L. Riker, before the members of the Quid Nunc Club of New York, a social body of fashionable character. Mr. Riker was well able to discourse upon this subject, as he is not only the President of the Riker Electric Company, but has himself produced some fifteen or sixteen different kinds of motor-vehicles, the result of nearly fifteen years' work. The paper, which was illustrated by lantern slides, besides treating of the development of the motor-vehicle from a historical point of view, took cognizance of the latest developments and popularly described the methods of control, brakes, etc. The paper elicited a fusillade of enquiries, many ladies taking part in desiring further information on points insufficiently elucidated.

#### An American Light Electrical Motor-Car.

THE Orient electric "runabout" made by the Waltham Manufacturing Company, Waltham, Mass., is an extremely popular vehicle in the United States. The frame is made from weldless steel tubing, the forward truck being swivelled to allow for unevenness of road without straining. The rear wheels are 34 inches and the front 32 inches in diameter, and are provided with 4-inch tires. The accumulator has a capacity of 1,800 ampère hours, and the current operates a ¾-k.w. motor. The radius of action is equivalent to about twenty-five miles on good level roads, but the car may be operated on poor, hilly roads with a proportionate decrease in mileage. A new pattern spur differential gear is attached to the driving shaft, which distributes the power equally on the driving wheels, whether running straight or in turning curves. The tractive power on each driving wheel is thus equalized. A 15 per cent. grade may be climbed. A forward range of speed of three to twelve miles, and backward range from three to six miles, per

hour is provided, controlled by a lever on the left of the carriage body. The steering lever is operated by the right hand pressed forward for steering to the left, and pulled backward to the right. The carriage may be turned about in a small compass, the steering wheels being automatically retained at the correct angle to prevent skidding. The brake is operated independently and simultaneously on the hubs of both driving wheels by means of a foot-lever. The weight of the vehicle is 1,000 pounds.

#### Public Motor-Car Schools.

THE letter published in another column of this issue, asking for information as to privately-owned grounds where amateurs may learn to handle vehicles with confidence, opens up a question which, we think, will need solution before long. It is all very well for a vendor of a motor-car to send out the purchaser in charge of a skilled man in order to teach him how to drive, and then to permit the vendor to take charge in some quiet country road, but something more is necessary. We have already had one fatal accident owing to the fact that a purchaser was permitted to take sole charge after about two hours' tuition, and for the benefit of the industry we do not want another similar case. Of course, what is every one's duty becomes no man's task, but surely some solution of the difficulty might be found. The Committee of the Automobile Club plainly do not regard it as their duty to provide such a ground, track, or schooling course, or else the subject would probably have been taken up in preference to many less important ones already handled. The manufacturers and vendors are not sufficiently united, we fear, to run a joint school and track, and the expense would be prohibitive to an individual firm. Does this offer an outlet for utilizing one or more of the, at the present, unprofitable cycle racing tracks? Of course, the cycle tracks, if considered necessary or advisable, could remain, but equally, of course, a fair road not less than thirty feet wide and paved with all kinds of materials and containing all degrees of gradients would have to be formed. It is not necessary that this should be circular—indeed it should in preference be serpentine, with several crossings. Who will be the first to take this matter up? Can we help? We do not care, at the present stage, to enter into the financial aspects of the question, but we think there are business men in the motor industry who will grasp its potentialities.

#### Eastbourne and Motor-Vehicles.

FROM the many recent prosecutions of drivers and owners of motor-vehicles at Eastbourne, that town has been looked upon as the *bête noir* of motor-car owners. It therefore occasioned us some considerable amount of surprise to find that at their meeting last week the Eastbourne Town Council seriously discussed the advisability of employing motor-dust-carts and motor-water-vans. Mr. Clarence Gregson, whom, we believe, has been the most frequent martyr to the police and public spite against motor-cars, has done good service to automobilism in Eastbourne. We heartily commend the Deputy-Mayor, Councillor Harding, and Councillor Lambert for their freedom from the prejudice of many of their constituents. If they want to learn whether motor-dust-vans are profitable, let them write to the Borough Surveyor and Engineer of Chiswick, whose report to his Board last year was a model of what a practical man's report should be.

#### Sale of Motor-Cars by Auction.

MESSRS. PARSONS & SON, auctioneers, of Brighton, recently sold by auction the stock-in-trade of the Brighton Cycle and Motor Company, Ltd., of 9 Marine Parade, in consequence of the expiration of the lease of their premises. The sale attracted a large number of buyers, and

the biddings for the various lots were *exceedingly* spirited. A Beeston Coventry motor-tricycle, 1½ h.p., realized £39; a Coventry motette, seating two persons, 2 h.p., fetched £49; and a Coventry Daimler motor-waggonette, 4 h.p., seating six persons and convertible to a mail phaeton seating four persons, realized £200.

#### Lady Drivers of Motor-Cars.

THE *Referee*, or rather "Dagonet," expresses surprise at seeing a "motor of the yellow chariot order careering wildly up Baker Street" in charge of a lady, accompanied by a lady friend and a "groom." If Dagonet's "liver" or his "mother-in-law," or any of his household impedimenta, will not interfere with his going to Paris, he may see during one short hour on the main boulevards, or in the Champs Elysées, at least twelve "fair driveresses," as he terms them, all "tooling" motor-cars through the Parisian traffic with ease, dignity, and grace. Dagonet's experiences with a motor-car (as a passenger), as recorded in last Sunday's issue of the *Referee*, should be a lasting lesson to him never to go out with a friend on a cheap motor-car. According to this veracious scribe the car jibbed at a hill, with the result that the passengers had to push it up the incline, and on reaching a decline the driver asked the passengers to dismount, as he was not sure of his brake. History doth not say whether the passengers became human brakes. Moral: Neither ride in, nor buy, a cheap motor-car.

#### Educating the Drivers of French Electric-Cabs.

A GREAT deal has been written lately in the popular magazines as to the methods adopted by the owners of the Parisian electric-cabs to teach their drivers to control their vehicles under the varying and troublesome conditions of traffic in the public streets of Paris. The daily newspapers have also devoted space to the matter on several occasions. The first journal to take notice of this matter in England was *Industries and Iron*, and subsequently, in November, 1898, an illustrated and full account of the methods adopted was given. An illustrated description would now prove of little service, but it may be mentioned that the schooling track is 700 yards in length, is paved in sections with every road paving to be found in Paris, has several gradients and one heavy "rompe" or "hill"—of course, artificially made. Over the length of the "course" is distributed various figures of men on cycles, girls wheeling perambulators, etc., all formed in sheet iron, and calculated to imitate the usual erratic road-crossing of Parisians. The pupil-driver's duty is to steer clear of these obstacles, and also avoid other pupils endeavouring to do the same.

#### Shall the French "School" be Copied?

A FACETIOUS correspondent, who has evidently been reading the current month's magazines, writes us asking whether the Parisian School for Electric-Cab Drivers, with all its concomitants of tin men and women, etc., should not be copied or followed in England. Fortunately, he does not allege that the drivers of the London electric-cabs are incapable; for our own part we must own that these men are amongst the finest drivers of motor-cars in England. The way in which they manipulate and control their heavy vehicles through the intricacies of London traffic is really wonderful and deserving of all praise. But none of these men have attended "school." They are all taken for a number of trial runs in a training car under the guidance of a skilled man, and the methods of control are shown and demonstrated to them, but their first trial at controlling a vehicle takes place in the streets themselves. To our minds carefulness is thus much more rapidly developed than would be the case if they had to guide their vehicles between rows of sheet iron dummy figures. It might be held that the risk to the

public is greater, but this is not our opinion, for with danger to human life in their minds their attention is closer than would be the case in dealing with "dummies."

**Public Motor-Car Services.**

IN our last week's issue we spoke of the continued increase in motor-car services in different provincial districts, and this week we are glad to record three more. A syndicate in Sunderland have been trying a motor-chars-a-bancs service in the town, competing against the local tramways. So successful have results proved that they have now placed an order for five more chars-a-bancs to continue and amplify the service. We are informed that passengers literally fight for seats, the disappointed ones retiring to the despised trams amidst the jeers of the occupants of seats. Another development is in the east. At Southend, a syndicate intends to run a service of three motor-chars-a-bancs between that town and Littlestone-on-Sea, and have ordered three cars for the purpose. The Motor Manufacturing Company, Ltd., have been fortunate enough to secure both orders, which speaks well for their vehicles. The third public service to be shortly inaugurated is at Dover, where a company has been formed with a capital of £5,000, £2,000 of which is at present issued, whose business it will be to run steam motor omnibuses between St. Margaret's Bay and Dover, carrying both passengers and parcels. There should prove a remunerative field for such a service, and we think other districts in the vicinity could also furnish profitable trade. The Liquid Fuel Engineering Company, Ltd., are to build the vehicles (carrying twenty-one passengers), and we understand that three are to be ordered on the first proving successful, as we have no doubt it will do. The idea is well supported locally, and the editor of the *Dover Express*, a great enthusiast in automobilism, has expressed the opinion in the columns of his paper that the venture is a most promising one.

**Tires for Motor-Cars.**

MESSRS. J. W. & T. CONNOLLY, the makers of the "Ideal" tire, draw our attention to the fact that under proper conditions it is practically impossible that their tires can be wrenched out of steel rims, as was the case in the recent Harrow accident. These tires, as is now generally well-known, are of solid rubber, and contain two heavy steel wires or round rods through them. The ends of these wires are electrically welded, with the result that so long as the weight of the car is not too great for the section of the tire used, it is practically impossible for the tires to leave the rims. The largest tire at present made by the firm is 2½ in. diameter, and these are recommended for cars whose total weight does not exceed 25 cwt. This firm's tires are equally as well-known for quality as the firm itself is for helpfulness and courtesy.

**The Easter Tour of the Automobile Club.**

THE itinerary of the Automobile Club's Easter tour has been finally arranged as follows:—Thursday, March 30th, London to Reading (40 miles): Start from the Club at 2 p.m., via Turnham Green, Hounslow, Slough, Maidenhead, and Twyford; Club dinner at "Queen's" Hotel. Good Friday, March 31st, Reading to Salisbury (54½ miles): Leave Reading at 9.30 a.m. for Whitechurch (30 miles), via Newbury; 1 p.m., luncheon at "White Hart" Hotel, Whitechurch; 3 p.m., leave Whitechurch for Salisbury (24½ miles), via Andover and Lobcomb Corner; 7.30 p.m., Club dinner at "White Hart" Hotel, Salisbury. Saturday, April 1st, Salisbury to Stonehenge and back and Lyndhurst (35½ miles): At 9.30 a.m. drive to Stonehenge and back (18 miles); at 1 p.m., luncheon at "White Hart" Hotel, Salisbury; at 2 p.m., leave Salisbury for Lyndhurst (17½ miles), via Waddon, Bramshaw and Cadnam; at 7.30 p.m., dinner at

"Grand" Hotel, Lyndhurst. Easter Sunday, April 2nd: Optional drive to Christchurch and Bournemouth; luncheon at "Royal Bath" Hotel, Bournemouth; drive home by Wimborne Minster and Ringwood. Easter Monday, April 3rd: Tour through the New Forest; luncheon at Romsey; at 3 p.m., leave Romsey for Winchester; Club dinner at "Royal" Hotel, Winchester. Easter Tuesday, April 4th, Winchester to London (60 miles): At 10 a.m., leave Winchester for Bagshot; at 2 p.m., lunch at Bagshot; at 3 p.m., leave Bagshot for London (24½ miles), via Sunningdale, Virginia Water, Staines, Brentford and Hammersmith.

**English Electric Vehicles in France.**

NEGOTIATIONS have been in hand for some time past for the introduction into France of the type of electrical motor-carriages designed and constructed by Mr. C. Oppermann, of Clerkenwell, E.C. We now learn from Paris that a company has just been formed in that city (3 Rue Scribe) for the purpose named, with a capital of £4,000, and with the name, La Société Française d'Automobiles Electriques.

**The German Army and Motor-Cars.**

THE German Military Budget would not appear on the surface to have any interest for motor-carists, but a careful investigation of the complex mass of figures reveals the fact that a sum equal to £5,000 has been provided for conducting trials with motor-waggons for the transport of ammunition, forage, victualling stores, etc. When will the English Government follow suit?

**Boston, U.S.A., and Motor-Vehicles.**

BOSTON, the "hub of the Universe," as it terms itself, is showing the customary narrow-mindedness of old cities. It is strong in liking motor-cars—in fact, proposes to build them for the use of its aldermen; but, alas! it has passed a ukase keeping motor-carriages out of its public parks except during the more or less "unholy" hours between 9 p.m. and 10.30 a.m.! Poor Boston automobilists!

**Motor-Bicycles.**

UNDETERRED by the want of any considerable success on the part of other experimentors, inventors continue to set their wits to work to devise a workable motor-bicycle. Not discouraged by the poor results as yet obtained by Charron, Rivière, Giradot, Osmont, and Werner, the attachment of a motor to the popular two-wheeler continues its fascination. Mr. H. J. Lawson is reported to be hard at work at Coventry with an entirely new form of machine of which great things are expected. This will, we understand, shortly be tried privately. In France the latest inventor is M. Arnaud Garreau. In his case the motor is attached to the frame close to the sprocket, the axle being turned by bevel gear. The motor is said to weigh 24 lb., and is started by pedalling in the usual way, the pedals communicating motion to the rear road-wheel. Electric ignition is employed.

ACCORDING to the daily papers, a serious collision occurred in the Waterloo Road, S.E., on Saturday last between a motor-van from Cambridge Heath and a motor-tricycle. The riders of the latter were endeavouring to pass the van, but apparently miscalculated the rates of speeds of both machines, the front of the van crashing into the rear of the tricycle. Fortunately the riders of the tricycle escaped with slight injuries, although the machine is said to have been considerably damaged.

# The Joel Electrical Motor-Carriage.

THE JOEL ELECTRICAL CARRIAGE.

OUR illustration shows a new form of electrical motor-carriage, elegant in appearance and of light weight. It runs very smoothly and noiselessly, and, owing to the way the motors are carried, without vibration.

This carriage has been introduced by "The National Motor Carriage Syndicate, Limited," of 37 Walbrook, London, E.C., to exemplify their patents for electric motors, and an under frame for carrying same, the invention of Mr. Henry F. Joel, A.M.I.C.E., and for storage batteries, the invention of Mr. S. A. Rosenthal; both motor and battery being the result of many years' experimental research and practical trials, with the special object of making them exactly suitable for traction purposes.

The difficulty in designing a motor-carriage to look as unlike a carriage requiring a horse to complete the effect is a great one. There must be the necessary seating accommodation for two or more people, including the driver, with a cover to protect them from the weather, the whole carried on three or more wheels. The ordinary brougham is the embodiment of the all-time past experience of these requirements. In addition, with the motor-vehicle room must be found for the storage batteries and motors, and the carriage must be sufficiently strong constructionally to carry their additional weight, whilst the motor must be conveniently arranged to exert its power.

The two electric motors used in this carriage are of comparatively very light weight and slow speed, as well as of high efficiency—three most necessary features. They are constructed with internal stationary field magnet cores of steel, having twelve poles arranged to interspace equally round a circle with the armature revolving on the fixed axle outside the poles. The field coils are wound centrally upon the core, and are almost entirely enclosed by the steel core

and poles, thus utilizing their greatest possible magnetizing effect. The armature is made with laminated iron rings, having holes for the wires. The winding of the armature is also novel and very effective, giving the least possible waste in the connecting and non-active parts of the wires, whilst the active parts are utilized to the best effect for economical working.

The following are the actual working data of these motors, as supplied to us by the constructors:—

| Type.             | Nominal<br>B.H.P. | Speeds<br>Revs. per<br>Minute. | Weight<br>of Motor<br>in lbs. | Electrical<br>Efficiency.       |
|-------------------|-------------------|--------------------------------|-------------------------------|---------------------------------|
| J.M. <sup>2</sup> | 2                 | 600                            | 112                           | 80 to 90%<br>According to load. |

These motors will run at quarter-speed = 150 revolutions per minute, half-speed = 300, and full speed = 600 as required. They are made to give 50 per cent. more b.h.p. for short periods, and will give 100 per cent. more power, or 4 b.h.p., if pressed. Carbon contacts or brushes are used on the commutators, and the motors will run either forwards or backwards without sparking.

The two motors, as will be seen from the illustration, are placed under the carriage, a little in advance of the back wheels which partly screen them, and they are not in any way unsightly; the motors are completely encased and weather-tight.

The under frame is one of the most important features in the success of this carriage. It is made of steel tube to form a rectangular frame suspended on springs, and connects the front and back axles of the carriage together; it takes the

place of what is known to coachbuilders as the "perch bar." This frame carries the two motors quite independently of the carriage, so that no vibration or shock is felt in the carriage when the motors are started or stopped, or when running. At the same time the frame is perfectly resilient under all conditions of the road, rough or smooth, and the motors and gear, whilst being kept in constant distance and tension, are elastic and free to give under stress, such as rough jolting or sudden strain due to temporary excess of electric current. In practice, this frame has been proved to safeguard the motors from jar or shock, whilst the riding in the carriage is most comfortable and easy.

The two motors drive the two back wheels independently—one to each wheel—by means of ordinary bicycle chains. The revolving armatures have small sprocket tooth-wheels fixed on one side, and the chains gear with these and then over a larger wheel or rim pulley fixed to the spokes of the back wheels, and thus propel the carriage. In the vehicle illustrated the outside rims of these larger pulleys are cased with leather, and the chains drive the carriage wheels by friction, just as a leather belt would do, the chains in this case acting as endless metallic belts with the exception that the small sprocket-wheel on the armature gives a positive drive to the chain. In other carriages introduced by the Syndicate both wheels have teeth for the chain in the usual manner. The special driving employed in this carriage, however, has been found to be very efficient, convenient for turning, and to give enough grip to propel the carriage up hills of 1 in 8.

The advantages of using two motors are the saving of the balance gears or differentials, whilst the slow speeds, 300 to 600 revolutions per minute, entirely obviate the necessity for the usual intermediate speed-reduction gear, and thus both weight and loss of power from friction are saved. The two motors also allow convenient control of speeds, and are self-adjusting for turning round corners, the motors automatically giving the difference in speeds as the turning movement requires. The constructors believe the practice of using two slow speed motors directly geared to the two driving wheels is the simplest and most efficient means of electric propulsion.

The storage batteries are arranged in four boxes of ten cells in each, or forty cells in all; two boxes go under the front seat and two go under the back seat, and are not noticeable. Each box of ten cells weighs under two cwt., and is easily handled and taken in or out of the carriage. The cells are furnished with pasted plates, the paste being so constituted that whilst it gives the greatest efficiency of active material, it retains its shape and compact adherence to the plates. The supporting grids are specially designed to allow free expansion and to avoid sulphating from local action. These cells have been submitted to most searching trials for over six years on carriages, cycles, boats, and in portable electric miners' lamps, and we are informed that such a thing as sulphating, the great cause of failure in most other batteries, is almost entirely unknown in these cells.

The following particulars of the cells used in this carriage have been furnished by the makers:—

| Weight Complete Cell. |        | Normal Rate of Charge. | Capacity in Ampère Hours at |                        | Watt Hours of Complete Cell at 20 Ampères Discharge. |           | Remarks.                               |
|-----------------------|--------|------------------------|-----------------------------|------------------------|--|-----------|--|
|                       |        |                        | 20 Ampères Dis-charge.      | 40 Ampères Dis-charge. |  |           |  |
| lbs.                  | Kilos. | Ampères.               |                             |                        | Per lb.  | Per Kilo. |  |
| 22                    | 10     | 20                     | 140                         | 120                    | 13   | 28.6      | 17 Watt hours per 1 lb. of plate only. |

Total weight of forty cells, with boxes complete, 8 cwt.

The commutator switch, or power and speed controller, has some distinct features. The action is simple, there being three speeds only: 1st, slow speed, about 4 miles an hour; 2nd, 8 miles an hour (about the speed of a fast "hansom"), whilst the 3rd gives 12 miles an hour. These variations are made by: 1st, coupling the batteries in parallel with the motors in series; 2nd, the batteries in series and the motors in series; 3rd, and finally, the batteries in series and the motors in parallel. The controller also gives slow speed backwards. There is a special quick-contact break to each of these changes, so arranged that only at the last moment of "making" or "breaking" is the change effected, thus ensuring perfect connection without sparking. The contacts are placed round a disc, with vertical spring contact arms.

This carriage will take three inside passengers, and a driver outside; the step up is easy, and there is ample head room. The total weight of the carriage is about 20 cwt.

With the batteries fully charged it is claimed that the carriage can travel 50 miles on good ordinary roads. The current used at the intermediate and usual speed is said to be 20 to 40 ampères at 40 volts pressure, and we are informed that this will last for 6 to 7 hours at a speed of 7 to 8 miles per hour, the total current consumed being 8 to 10 units. The current required to re-charge the battery is 10 to 12 units, which at 3d. per unit makes the cost for current 3s. for each run of 50 miles, or at the rate of say 3d. per mile run.

The driver has a foot brake applied to the two back wheels. This brake has a double use: when pressed it acts upon a switch in the main circuit, and puts in resistance between the "on" and "off" contacts, so that the current is reduced as the brake is partly put on and finally cut out when the brake is hard on. This is useful, as the driver after he has set the controller to the required speed, need not alter it, but can do all the regulating with the brake.

The distribution of the weight of the batteries equally over the front and back wheels, and the method of independent driving of the two back wheels, has greatly to do with the reduced weight of the carriage: the strains are equally divided, the adhesion of all road wheels is practically identical, the carriage is of lighter build than usual, less power is required to run the carriage alone, and this again means reduction in weight of batteries, motors, etc.

Many trials have been made with this carriage on long journeys up and down hills, and it has been thoroughly tested. The batteries have also been most carefully examined from time to time after long runs, and experience has demonstrated the suitability of the whole apparatus for electric motor-carriages. Many favourable opinions and testimonials have been given of the comfortable travelling and freedom from noise and vibration which are remarkable features of this carriage.

The Syndicate unfortunately do not propose to make or supply complete carriages, but simply to supply the electrical equipment, with motors mounted in place on the under-frames, adapted for any carriage with simple attachment to the front and back axles, and ready for the carriage builder to design and build his work upon. Batteries ready in sets to go under seats, and controllers ready to fit for the driver, with full instructions how to apply them, and practical tuition afterwards in their use, are also proposed to be included in the equipment.

The complete carriage, with electric-motors, batteries, etc., was constructed for the Syndicate by Messrs. Henry F. Joel and Co., 31 Wilson Street, Finsbury Square, London, E.C.

THE Bordeaux Automobile Club is organizing for May 21st and 22nd next a motor-car race between Bordeaux and Périgueux. The race is to be international in character, and will be divided into three classes—racing motor-vehicles, touring vehicles, and heavy motor-cars.

## SCOTTISH NOTES.

## On the Road.

SATURDAY was perhaps not an ideal driving day in the West of Scotland, but the absence of rain tempted out a considerable number of "Chauffeurs," and some good runs were accomplished. The gusty "sou'-wester" blowing gave a little trouble to those who were driving with unprotected ignition lamps, but from all reports received, in spite of this and the soft roads, some good times were made. The Glasgow and Carlisle road seems still to be the favourite route for motor-carists in the west, and this, no doubt, for numerous reasons. It is the old "coach" road, is well built, being one of Telford's, and, while undulating in places, offers occasional opportunity for exhilarating "top speed" runs of many miles.

## New Scottish Cars.

I HAD an opportunity this week of inspecting some new cars which will shortly be on the road. The designs were quite new and most elegant. After a trial run, which I am promised very shortly, I will be able to write more fully on the subject.

## Scotch Ladies and the Motor-Car.

It is not so long since the motor-car was a "horrid thing" in Scotland more or less vigorously maligned by our fair lovers of the graceful and noble horse, and the day seemed a good way off when "my lady" would mount her motor-car as gleefully as a short time ago she did her bicycle. I learn, however, that the old century is not to be allowed to die without seeing a great step toward such a happy state of things. One firm in the north, I understand, has booked important orders for cars specially designed for ladies' driving, and I judge, from the numerous applications which this firm inform me they are having for similar carriages, it is evident that this year a new attraction will be added to the already fascinating pleasures of automobilism. Several causes have doubtless brought this about earlier than was anticipated—"they do it in France" certainly is one—but I think the rapid improvement in construction and design has done most to remove the previous prejudice and dislike so speedily.

## Cycle versus Motor.

So late as a year ago it was perfectly orthodox to say that if you take away the healthful physical exercise which is afforded in cycling, its chief charm will be lost. In common with most people I subscribed to this "fundamental," but only for so long as I was without personal experience of the motor-cycle. In the old days I had ridden a tricycle and had little difficulty therefore in overcoming the, at first, peculiar sensation of running on three wheels instead of only two to which the modern cyclist is familiar, and carrying out the maker's instructions I soon mastered the propelling mechanism. This done, my first motor journey opened up for me a new world of pleasure. There was a new excitement in whirling along familiar high-ways without effort, quickly and easily surmounting hills, which on the cycle had so frequently caused no little discomfort. On and on and on in the bracing air, moving only a tiny lever now and then to slacken or increase the speed at will, I discovered, with this wonderful little bit of machinery under me, the pleasures of cycling multiplied ten-fold, and at the end of my journey experienced also that pleasant sense of fatigue which comes after a moderate amount of physical recreation to which the rational cyclist is so familiar. The number of motor-tricycles in Scotland is increasing every week and several notables in the cycling world have already embraced the "new mode,"

among them being "Jamie Inglis," the erstwhile tricycle champion of Scotland, who only a short time ago had delivery of a magnificent "Ariel" tricycle.

## In the Far North.

THE Corporation of Aberdeen a year ago was anxious to introduce motor-cars to connect the city with Duthie Park and the new Bathing Station. I have not heard that any further steps have been taken in this direction. I believe that several Members of Council were enthusiastic in the matter, and they should make a further effort to have this fresh attraction added to the many others of the Granite City.

## The Proposed Club.

THE movement for the establishment of a Scottish Motor-Car Club, to which I referred last week, is, I am informed, a strong and active one, and the intention is to make Glasgow its headquarters. Two proposals are at present having the consideration of the promoters. One, that the organization should be distinctly Scottish and independent; the other, that it should be made a branch of the Automobile Club of Great Britain. Of the two proposals, I think the latter should receive most consideration. It is desirable at the very outset that there should be one large and influential Association, the recognized authority throughout the kingdom on all motor-car matters. Such a combination would enable great weight to be brought to bear in all matters affecting the interests of automobilism, and this could not fail to be of very great value to Scotland; and there is no reason why such an arrangement could not secure the same liberty of action as an independent club, and at the same time obtain all the advantages of a strong union. The management would be local and distinct, while in matters of importance the whole influence of the United Automobile Club of Great Britain could be brought into requisition. It is intended shortly to convene a meeting of all interested to fully discuss the subject and make such arrangements as may be considered necessary for the early institution of such a Club. Due notice of this meeting will be made through these columns.

## The New Journal.

THE advent of *The Motor-Car Journal* has created quite a *furor* in the north, and I have heard numerous highly-complimentary remarks regarding it. I am glad to have the pleasure of being its representative in the "land o' cakes," and trust it will continue to receive the appreciation of those numerous enthusiasts in motor-car matters in the northern division of the kingdom.

## Motor Hiring Firms.

THIS year there promises to be an increase in the number of concerns using motor-vehicles for public conveyance and hire in "bonnie" Scotland. In several new centres motor-car services will be inaugurated, and there will be an increase to the present stud in one or two of the localities where they were introduced last year. I understand that, on the whole, Scotch hiring firms are satisfied with the results of last year's business, although in more than one instance they were much handicapped through the inexperience of their men. This, of course, is inseparable to all new industries, and although the experience of the past has been more or less costly, the value of it will soon be manifest in the improved earnings of this year. I am of the opinion that it would be greatly to the advantage of the leading jobmasters throughout the country not to allow the motor-car business to slip through their hands. There undoubtedly exists a public demand for these vehicles, and if they added one or two good motor-cars to their establishments

their enterprise would without doubt prove commercially successful.

#### The Dundee Show.

At this show, which closed on the 4th inst., Messrs. Stirling had a Daimler dog-cart and two Pennington cars on show. At both these exhibitions the public interest was very great, and I believe that a considerable number of orders was booked by the firms exhibiting. A noticeable feature this year at the show was the new interest manifested on the part of "ladies of fashion," and I understand that orders have been booked by one firm for light phaetons specially designed for ladies' driving, with a single seat behind to accommodate the "footman." This is encouraging. Ladies took to the cycle and placed on it the crown of its popularity, and now that they are attracted to the motor-car we look for the rapid spread of a new enthusiasm, and the popularising—although of course in a lesser degree—of the practice of automobilism throughout Scotland and everywhere else.

#### Non-Materialisation of Miracle Workers.

Of the mechanical miracles which rumour in the earlier days promised, none as yet have materialised, and, to our personal knowledge, the majority have long since found their way mysteriously to the "scrap heap." The reason of all this is plain. In the mechanical road carriage an entirely new set of mechanical problems present themselves to engineers and carriage builders alike, and it has only been where this fact has been realized that progress has been effected. This fact having now been generally admitted, the progress of motor-car manufacture is moving on apace, and with the perfecting of numerous details in construction and design, the public demand for pleasure carriages is growing with extraordinary rapidity, and the present year promises to be one of marked prosperity to the makers here who are keeping their productions up to date.

#### Motor-Cab Company.

THERE is some talk just now of a Motor-Cab Company for Glasgow, from which it is evident that the "second city" is beginning to wake up, and does not intend much longer to be behind the times in its street cabs. No doubt the successful introduction of mechanical traction in the city tramways has drawn attention to the other methods of street locomotion. It has not yet transpired what power is regarded as best suited for the work. So far as electricity is concerned, I am afraid that electric-cabs would not prove successful, on account of the extraordinary wear and tear in the necessary accumulators on the badly-paved streets of the city. A simple and well-made oil motor would, I think, be better adapted for work under the special conditions.

#### Motor-Cars in Edinburgh.

ONE of the concerns which is doing much to advance the motor-car movement in the east of Scotland is the Edinburgh Motor-Car Co., of London Road, Edinburgh, of which Mr. John Love is the manager. This gentleman claims to have been the first to introduce automobile vehicles in that part of the country, and has devoted considerable attention to the industry, with the result that he has now established a profitable business in hiring out motor-vehicles for public and private purposes, no less than six cars with motors on the Daimler system and one Coventry motette being available for this service. Mr. Love has fitted up workshops in which all the necessary repairs to the vehicles can be effected, he having found by experience that the initial expense thus entailed is more than covered by the satisfactory results obtained.

BROWN HEATHER.

## THE HENRIOD PETROLEUM-SPIRIT MOTOR-CAR.

A FRENCH concern which has been quietly perfecting its motors and motor-carriages for some time past is the Compagnie des Automobiles et Moteurs Henriod, of 7 Rue de Sablonville, Neuilly, Paris.

To deal first with the petroleum-spirit motor, Fig. 4. This works on the Otto cycle, and has two horizontal cylinders placed opposite to one another in such a way that their piston-rods are connected to the same crank at an angle of 180 deg. to each other. The valves are so arranged that an explosion takes place in the cylinders alternately, the crank shaft of

FIG. 1. GENERAL VIEW OF HENRIOD 6-H.P. PHAETON.

the motor thus receiving one impulse per revolution of the fly-wheel. A feature of the Henriod motor is that no carburettor of the kind usually understood by that word is employed, but in its place a special mixing device, placed centrally over the motor is used. We have been furnished with a sketch of the device, but as certain of the patents have not been completed we refrain from illustrating it at the moment. We may mention, however, that it is claimed that the new mixing apparatus has not only proved itself efficient in practice, but that it possesses the great

FIG. 2. PLAN OF HENRIOD FRAME, SHOWING POSITION OF MOTOR AND POWER TRANSMISSION MECHANISM.

merit that the explosion chamber is never in communication with any petroleum spirit beyond that which is required for the ensuing impulse. Electric ignition is employed, while the exhaust valves are actuated by "pushers," having at one end rollers which are always in contact with the cams carried on an auxiliary shaft driven off the motor shaft. Another feature of the motor, which is made in sizes from 4 up to 12 h.p., is that no water-jacket is employed to keep the cylinder cool, this being effected, even in the large-sized engines, by a

special form of radiating discs, and by arranging the cylinders to work in a somewhat super-heated state. Another point about the motor is that it will, the makers claim, work equally well with petrol, petroleum, or alcohol—the latter being just now very much on the *tapis* in French motor-car circles. The Henriod Company have for some time been running one of their cars by means of alcohol instead of petroleum spirit, the only alteration being the placing of alcohol in lieu of the petroleum in the storage tank; and they state that excellent results have been obtained, although there is a loss of power, estimated at about 20 per cent., as compared with petroleum spirit.

FIG. 3. ELEVATION SHOWING POSITION OF HENRIOD MOTOR.

It will be seen from Fig. 2 that the prolonged end of the motor shaft carries three bevel wheels, which, while rotating with the shaft, are so mounted as to be capable of being moved slightly along its length. Three speeds are thus provided. The intermediary shaft, at right angles to the motor shaft, carries the differential gear and two large discs, one of which, that which gives the backward motion, is so arranged that it can, by means of a lever, be slightly moved along the shaft. These discs are provided with teeth, the

FIG. 4. PART SECTIONAL ELEVATION OF HENRIOD MOTOR.

large one having three rows of teeth arranged at such distances that any one of the bevel wheels on the motor shaft can, under the action of the lever within easy reach of the driver, be placed in gear with its corresponding row of teeth on the large disc. From the intermediary the power is conveyed to the rear road wheels through the usual sets of sprocket wheels and pitch chains.

We illustrate one (Fig. 1) of the Henriod motor-carriages—a three-seated 6 h.p. phaeton; but the Company are also building three and four-seated carriages—ducs, brakes, phaetons, etc.—and also eight to ten-seated omnibuses, etc., which can be fitted with motors of any capacity from 4 to 20 h.p. The smaller vehicles are provided with three band brakes—one working on the differential gear,

and one on each of the hubs on the rear road wheels. The larger vehicles are, in addition, provided with shoe brakes operated by the usual French hand-wheel and screw arrangement. The front or steering wheels are mounted on the usual short vertical pivots (Fig. 3), the steering being effected by means of a bar.

The Henriod Company are also devoting attention to the construction of motor-tricycles and quadricycles. These are fitted with a vertical single cylinder of 1½ h.p. A feature of the Henriod motor-tricycle is the absence of the usual triangular-shaped carburettor, the motor being provided with the special mixing apparatus above described.

## NOTES FROM PARIS.

AS is now generally well-known in England, Messrs. Panhard and Levassor have recently produced a light motor-car provided with a new horizontal motor of 3 h.p., the inception being due to Capt. Krebs. The sale price of this car in Paris is 5,500 francs, and it is intended that this vehicle shall replace the heavier car with a 4 h.p. (nominal) Daimler-Panhard, for which there is no longer any demand in France. But peculiarly enough the 4 h.p. car has been displaced in public demand by reason of a continually growing request in France for vehicles of a greater horsepower and having higher speeds than is possible with the 4-h.p. motor. It is therefore rather strange that Messrs. Panhard and Levassor should seek to create a demand for a vehicle having lower power.

A MOTOR-CAR RACE has been organized to take place during the Whitsun holidays between Draguignan and Arcs, a distance of 100 kilometers.

As may be judged from expressions in the French papers, manufacturers of motor-cars are not quite contented with the arrangements made by the Commissioners of the Exhibition of 1900 with regard to the display of automobile vehicles thereat. They have been officially relegated to the Bois de Vincennes, and there is some suggestion that a course shall be formed around the lakes, which shall in fact be a huge "automobilodrome," where it will be possible to demonstrate the powers of cars and to conduct experimental runs. The Bois de Vincennes section of the Exhibition is devoted to all kinds of exhibits relating to sports and pastimes. Its distance from the centre of Paris is, however, so great that we fear comparatively few people will take the trouble to visit it. There is to be founded, however, in the Champ de Mars a special and permanent exhibition of motor-vehicles. In regard to experimental runs, it is now anticipated that the majority of these will take place in the Bois de Boulogne, for it is not reasonable to imagine that those interested will leave the Champ de Mars and cross the whole of Paris in order to try their cars in the Bois de Vincennes.

MESSRS. DE DION & BOUTON have been endeavouring for some long time to produce a light motor-carriage needing but a motor of low power to propel it, and being capable of carrying two, or at the most three, persons. This type of carriage would meet with a large demand both in Paris and, it is to be imagined, also in London; but unfortunately, notwithstanding the efforts of inventors, no really practical "voiturette," or light carriage, has yet been placed on the market. All inventors have arrived at transforming a motor-tricycle into a "voiturette," by adopting some peculiar form of body, and by using a slightly more powerful motor. Unfortunately, also, most have adhered to air-cooling devices for the motor, amongst those houses who have done so being Decauville, Henriod, Renaud, Dumond, Schmidt, and Elan. In every case, however, cooling the cylinder and explosion chamber by means of air has proved

insufficient, and hence the reason for the restricted success of these and many other voiturettes. Messrs. Panhard and Levassor, as well as the Mors Company, have adopted an intermediate course by permitting the cylinder to be cooled by air circulation, and placing water round the explosion chamber. Most probably both these voiturettes will prove successful; but in the meantime they are not ready for sale to the public. Messrs. De Dion & Bouton, knowing quite well by lengthy experiments that air cooling is insufficient with carriages of this type, have departed entirely from that principle, and have devoted themselves to the construction of a very light car (250 kilogs.) with a 3-h.p. motor whose cylinder is cooled by a water-jacket, a "refroidisseur" or condenser also being fitted, and a circulating pump employed. This exceedingly pretty voiturette, the reproduction in miniature of a large carriage, is now under trial every day, and is found to go very well indeed. Its price will be 4,000 francs, but none will be ready for delivery for some time yet. It is possible Messrs. De Dion will have one of these cars ready for exhibition at the Agricultural Hall in July next, when the English public will be able to appreciate its performances.

M. LE COMTE DE DION is said to have taken up a new project, that of forming a portable charging plant for electric vehicles. It is said to comprise a small high-speed petroleum engine acting direct on a dynamo producing current for charging the storage batteries at the end of a journey. One of these plants is now in hand.

THE new rules governing and controlling the progress of motor-vehicles in France have now been issued. These state that the maximum speed of a motor-vehicle in towns shall not exceed 20 kilomètres an hour, whilst on the suburban and provincial roads a maximum speed of 30 kilomètres per hour is permitted. These regulations do not apply when races are taking place, so long as permission has been first obtained, and under such circumstances any possible speed is permitted. All drivers, whether amateur or professional, have to obtain a licence from the "prefet" and pass a slight examination on the management and construction of their vehicles. This holds good even in the case of a motor-tricycle. French motor-carists hope that these regulations will not be stringently enforced.

AGRICOLA.

THE L. C. Chase Co., Boston, U.S.A., has closed a big contract with one of the prominent French motor-cycle makers for motor-cycle tires.

THE French Automobile Club has decided to appoint a Commission to work in consort with the Touring Club of France on the question of standard sizes of French motor-car chains—a subject which was dealt with in our last issue.

THE first meeting of the newly-formed Automobile Club des Flandres has just been held at Ghent, when M. de Hemptinne was elected the first president. The temporary head-quarters of the Club are at the Hotel Royal, Ghent.

IT may be interesting to prospective tourists in Belgium to learn that it is proposed to establish a line of motor-omnibuses along the banks of the Meuse, between Namur and Dinant. This will be the first line of motor-conveyances in Belgium.

THE Automobile Club Bearnais is organizing a motor-car and motor-cycle race between Pau and Bayonne and back, to be run off on April 6th next. Already a large number of entries have been received.

IN response to a petition of the Austrian Automobile Club, the Chancellor of the Exchequer of that country has abolished the import duty on benzine and spirit used as fuel for motors in Vienna; but satisfactory proof must be given to the authorities that the spirit is intended for motors.

## MOTOR-CARS ON THE CONTINENT.

—8—

### A New Bollée Voiturette.

It is announced that Messrs. Darracq and Co., of Suresnes, France, have just commenced the construction of a new type of motor-carriage to the designs of M. Leon Bollée. It is described as a four-seated carriage, to be provided with a 5-h.p. motor, five forward speeds, one backward motion, and to weigh about 10½ cwt.

### English Representation on the French Exhibition Committee.

THE name of Sir David Salomons is, we note, included among the list of gentlemen who have been appointed on the Committee of Organization of the Motor-Car Exhibition to be held at Paris in June next under the auspices of the French Automobile Club.

### Motor-Vehicle Manufacture in Belgium.

QUITE a number of new motor-car concerns have lately been formed in Belgium, and particulars of two additional ones have just come to hand. The first is that which has just been formed at Malines, with a capital of £50,000, and with the title La Société des Automobiles N. Vincke, to carry on the works and business of M. N. Vincke, motor-car builder, in that town. The second is La Société des Ateliers Vivinus, formed in Brussels, with a capital of £12,000, "to manufacture motor-vehicles, motor-cycles, and cycles," and to acquire and carry on the works and business of Messrs. A. Vivinus & Co., 244 Rue du Progrès, Brussels.

### Accumulator Competition in France.

EIGHTEEN entries have been received in connection with the accumulator competition which is being organised by the French Automobile Club. The list is as follows:—(1) Société Anonyme pour le Travail des Métaux (brevets Laurent-Cély), 13 Rue Lafayette, Paris; (2) Compagnie Générale Electrique (Pollak), 33 Rue Oberlin, Nancy; (3) Société Française de l'Accumulateur Tudor, 48 Rue de la Victoire, Paris; (4) Société Belge de l'Accumulateur Tudor; (5) Société Anglaise de l'Accumulateur Tudor; (6) Vereinigte Accumulatoren und Electricitaets-Werke, 36 Kreuzbergstrasse, Berlin, S.W.; (7) Società Cruto, Pescetto Accumulator, Turin, Italy; (8) Legarde, 29 Rue Pixérécourt, Paris; (9) F. Wereste, Baden, Germany; (10) Blot-Fulmen, 39 bis Rue de Châteaudun, Paris; (11) Société de l'Accumulateur Fulmen, 19 Quai de Clichy, Clichy; (12) Société des Accumulateurs Phénix, 34 Avenue de Clichy, Paris; (13) G. B. Marzio, Piazza della Sagrestia, Rome, Italy; (14) Compagnie Générale d'Electricité (Pulvis), 5 Rue Boudreau, Paris; (15) John G. Hathaway, London; (16) Société des Soudières Electriques, Gavet-Clavaux, Isère; (17) Franz Heimel (Titan), 5 Strohgassee, Vienna; (18) Messrs. Pop and Sons, of Slough (Titan accumulators). It will be noticed that the entries include three English competitors. There are several missing names in the French list, notably those of Patin and Julien.

### Record-Breaking in France.

THE record-breaking craze, which has for some time pervaded certain sections of the Paris automobile world, is still unabated and unrestrained, Count Chasseloup-Laubat last week once more attacking and beating the records held by M. Jenatz. The Count employed a new Jeantaud electric-car, which by reason of its pointed ends had very much the appearance of a huge cigar on wheels. The motor had a capacity up to 36 h.p., while the weight of

the vehicle complete was about 1½ tons. From a standing start one kilometre was covered in 48½ sec., as against Jenatzy's time of 56½ sec.; while two kilometres were covered in 1 min. 27½ sec., as compared with 1 min. 41½ sec., the previous record. The Count's chief exploit was, however, a kilometre, with a flying start, covered in 38½ sec., or 6 sec. less than the previous best; this speed being equal to a rate of no less than about 58 miles per hour. It is seriously to be trusted that if the French authorities will not interfere and put a top to these competitions, the friends of the competitors will endeavour to dissuade them from further risking their lives, for while record-breaking can in no practical way help on the automobile movement, it will undoubtedly, if persisted in, end in a fatal disaster.

#### An Improved "Elan" Voiturette.

SEVERAL minor but effective improvements have been introduced in the 1899 models of the neat two-seated motor-vehicles made by the Société des Automobiles Elan, of 64 Avenue de la Grande Armée, Paris. *Aillettes* or radial

discs are depended on in this vehicle to effect the cooling of the cylinders, but, as has been the experience of many other firms, this method has not altogether proved satisfactory. The Elan Company claim to have got over the difficulty by fixing a small fan in front of the motor by which it is driven; thus a greater current of cool air through the radial discs is directed on the cylinder the greater the speed of the motor. One French contemporary, *La Locomotion Automobile*, mentions a run one of its staff had lately on one of these vehicles, when the distance between Paris and Saint-Rémy-les-Chevreuse via Versailles was covered without a stop, notwithstanding the hilly nature of the route.

#### Motor-Car Steering Gear.

SOMETHING new in steering gear for motor-cars is promised at an early date by M. C. Bourlet, Professor of Geometry at the Ecole des Beaux-Arts, Paris. M. Bourlet considers that none of the existing types of steering gear comply exactly with theoretical conditions. As a result of his studies he has devised a system which he claims to be not only theoretically correct, but to present no constructional difficulties. Before making the device known he is carrying out some practical experiments with it. We look forward with interest to further particulars of Bourlet's steering gear.

#### The Toulouse Motor-Car Race.

LA SOCIÉTÉ DES CHAUFFEURS DU MIDI, of Toulouse, is busy making final arrangements for the motor-car race which is to be run off between Montpellier, Beziers, and Toulouse, on Saturday, the 1st of April. The race is divided into three classes: (1) racing vehicles; (2) touring vehicles; and (3) motor cycles—the distance being about 152 miles.

#### An Improved Fore-Carriage Motor Attachment.

THE *avant-train* or motor and transmission gear, all mounted on a pair of wheels in such a way that it may take the place of the usual fore-carriage of any vehicle, of Messrs. Amiot and Peneau, of 47 Rue de Château, Asnières, France, has undergone considerable modification since it made its first appearance. It is now announced that it has been brought to a state of practicability, as demonstrated by a trial just made with a vehicle—a family omnibus—provided with an *avant-train* of the latest design. The vehicle was driven from Paris to Dieppe by its builders *sans accident*. The motor employed is one designed and built by Monsieur Daniel Augé, of Levallois-Perret.

#### Marot, Gardon and Co.'s New Voiturette.

MESSRS. MAROT, GARDON & Co., of 33 Rue Brunel, Paris, have acquired an old factory at Corbie (Somme) in which to carry on the construction of motor-cars. This firm has lately brought out a new light two-seated carriage. It is propelled by means of a 3-h.p. two-cylinder petroleum-spirit motor located in the front part of the carriage. No water-jacket is employed, the cooling of the cylinders being effected by means of radial discs. Three forward speeds and one backward motion are provided.

#### Motor-Cars in Scandinavia.

A COMPANY has just been formed in Copenhagen (28 Bredgade) with a capital of £26,600, to be known as the Northern Motor-Car Company, Ltd., for the sale of motor-cars and motor-cycles in Denmark, Sweden, and Norway. The new concern has, it is announced, secured the agency for De Dion motor-tricycles and Daimler-Panhard motor-vehicles in the countries named.

#### Franco-Greek Motor-Car Organization.

A NUMBER of the leading members of the Greek colony in Marseilles, with several local French sportsmen, have, according to *La Locomotion Automobile*, just founded the Automobile Club Franco-Grec de Marseilles. Should the new club organize a motor-car race it will be a literal case of "Greek meeting Greek" with just a little *soupeçon* of Gaul (gall).

#### The French Automobile Club Show.

THE French Automobile Club's Exhibition in the Tuileries Gardens seems likely to prove as successful as that of last year. As we go to press we learn that the following have already applied for and booked spaces; and these were all received in three days!—MM. Dion and Bouton, Panhard & Levassor, Decauville, Peugeot, Darracq & Cie., Jeantaud, Krieger, Marot Gardon & Cie., Kelly Co., Darracq, Vermorel, Amiot & Peneau, Chauvenet, Gros, Richard & Co., Bernheim, Malicet & Blin, Bollée, Bail Pozzy & Cie., Gougon Freres, Chary, Goyet and Legras, Gobron & Brillee, Le Brun & Cie., Daniel Augé and Cie., Alfred Dinin, Louis Miguët, Pigier, Henry, Hugot, Bonnafous, Thevenin Freres, Seguin & Cie., Chouanard, Tenting, J. & O. G. Pierson, A. Rossel, Wetzel & Fils, Block & Cie., Arnaud & Marot. Many other firms have also made application, but have not yet completed all formalities.

#### The Cannes-Nice Race.

THE Cannes-Nice motor-cycle and motor-car race run last Sunday was enjoyable from the point of view of the weather, but the races themselves were rather disappointing. In the motor-car section only one car entered, and this covered the distance in 2 hr. 20 min. In the motor-cycle section Roubet was first in 1 hr. 36 min., Jouan second in 1 hr. 41 min., Garin third in 1 hr. 53 min., and Count Baglion fourth in 1 hr. 55 min. Marcellin was riding, but had deserted his old love, the "Phœbus" machine, of Messrs. Nos Boyer & Co., in favour of a "Perfecta," of Messrs. Darracq & Co. This desertion met with heavy punishment, as the "Perfecta" broke down, and Marcellin was left out in the cold. Further castigation was incurred from the fact that the winner, Roubet, an unknown man, won the race on a "Phœbus!"

LA COMPAGNIE STEPHANOISE DE TRACTION AUTOMOBILE is the style of a new concern which has just been formed at St. Etienne, France, with a capital of £4,480.

## CORRESPONDENCE.

## SPEEDS OF RIVAL MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with considerable amusement Mr. Wridgway's letter, published in your last issue. As I believe the tricycle he now uses is the same that he rode at Sheen House and finished last in the races held there in November, he surely cannot claim that it is the fastest machine in England, and, as a matter of fact, I know two or three riders who have machines which, I believe, are considerably faster than Mr. Wridgway's. Moreover, his statement that he has often done thirty-three miles under an hour on this machine I do not believe, and doubt very much whether he could do one mile at the rate of even thirty miles an hour.

As for the Pennington, we have all heard of this machine before. It is a very easy matter to fit two large cylinders to a motor and make it run for a short distance at a high speed, but if Mr. Pennington only did a little more actual supplying to the public and a little less dashing about at a high rate of speed on his machine (which, I believe, was specially built for the purpose in 1896), all motor-carists would thank him a little more and become more firm believers in his cars.

In regard to the suggested Pennington-Mors competitive trials and the reputed high speeds of these vehicles, I believe a good Daimler motor of the same h.p. on an equally light body would leave both of them standing still.

Yours faithfully,

London, S.W., March 14th, 1899.

"CYNICUS."

## WHEELS AND TIRES FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We note your remarks in your issue of the 10th on motor-car wheels and tires. A matter which has been much overlooked in the construction of motor-vehicles is that the rear wheels have not been sufficiently strong to withstand the shocks to which they may be subjected. The Harrow accident points a moral to all manufacturers employing wooden wheels without staggered spokes. In this age of steel we should rather look to its use in wheel construction, for, with half the weight, a steel wheel will stand many times more strain than a wooden wheel. A proper principle to observe in the construction of a tangent-spoked wheel is that the hub should be two or three times the width of the rim, varying according to the diameter of the wheel. With pneumatic tires it is entirely unnecessary to use large diameter wheels. If the tire should be 4 ins. in section, a very small diameter wheel can be used with the same results as a large diameter wheel with solid tires, while in the latter the weight is increased out of all proportion.

Another thing is that pneumatic tires should not be put on a heavy vehicle or a fast running vehicle without being securely bolted to the rim.

Wheel\* brakes are a source of much danger either with solid rubber or pneumatic tires. There ought to be sufficient band brakes, even although they may have to be applied to the wheels independently.

There is no doubt, again, that excessive weight is a serious danger. The tendency of most makers is to decrease the weight of motor-cars, and when this is general it will be found that fewer accidents will occur.

No car should be so shortly coupled that the passengers overhang the wheels, as was the case with the Daimler car in the Harrow accident, for, were the truth known, it might be found that the overhanging weight had as much to do with the collapse of the wheel as any other cause.

Yours faithfully,

PENNINGTON & BAINES.  
per W.B.

Manchester, March 14th, 1899.

\*Query:—"Tire brakes"?—Ed. M.-C. J.

## THE PENNINGTON MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note in your last issue two letters, one from a Mr. Grierson in reference to the Pennington motor-car, and one from Mr. C. G. Wridgway, which refers simply to the Pennington motor.

It would interest me very much to know if the experiences which are related by the two gentlemen in question are experiences of the ordinary type of small motor-car which Mr. Pennington is at present advertising he is ready to sell and is selling.

I should personally like a few more particulars as to the weight of these vehicles, exact form or height and what b.h.p. the engines develop to sustain the speeds referred to. Particularly would I like to know the type of car against which Mr. Wridgway tried his tricycle as a test of speed.

I myself have had the pleasure of a ride on a vehicle of Mr. Pennington's, but it was not one that would be of much use to the ordinary person, being in the form of a kind of tricycle, with people perched round it.

I believe everybody is interested in his cars, and if only one would come somewhere near London I should like to know where it is, so that I might take a run out in its company for a hundred or two hundred miles.

Yours, etc.,

S. F. EDGE.

London, March 13th, 1899.

## WHEELS AND TIRES FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—From the remarks made in regard to the causes of the Harrow accident, and also from the "Comment" in your issue of last week dealing with tires and wheels for motor-carriages, it is evident that we have by no means reached finality in regard to these essential particulars. Mr. S. F. Edge's paper on "Pneumatic Tires for Motor-Vehicles," though interesting in itself, does not appear to help us, nor does the discussion which followed materially add to our information. Pneumatic tires undoubtedly add to the comfort of a vehicle, but I for one would like to know the result to the tire when the wheels of a vehicle weighing 19½ cwt., carrying a load of four persons totalling 46½ stones, and proceeding down a hill 1 in 12 for 300 yards, 1 in 16 for 420 yards, and 1 in 18 for 600 yards, at a speed of 12 miles per hour, are kept more or less under brake control during the whole time. The wheel question is an even more important one. If the felloes are liable to be ripped off the spokes when the wheels are skidded and a corner is being negotiated, then it would appear that some other form of wheels is required. But looking all round me I can find no wheel and no tire that can be termed "ideal" for motor-car work, and so far as my experience goes it is as bad in France as it is here. The French wheels are certainly heavier than ours—that is, they have more wood in them; but I doubt whether they are more capable of resisting the heavy, twisting strain of a vehicle proceeding on a curve with wheels skidded.

Yours faithfully,

L. LECOMTE.

Madeley, March 14th, 1899.

## MR. WRIDGWAY BEATING THE MORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Wridgway's letter in the last issue of your valuable paper, I should like to point out that I have been personally on one of the two Mors cars with which Mr. Wridgway says he "had an impromptu race," and I am more than surprised to hear him say now he had "easily beaten" us. As a matter of fact, when pedalling as hard as he could he used to be able to get in front of us when going up-hill, but when going down-hill or on the level he was always behind us, and when we talked it over later on

we agreed that it had not been possible for either of us to get away from each other. It is rather incomprehensible to me what has made Mr. Wridgway change his mind in so short a time.

As to his being "amused that the Automobile Association, Limited, talks about racing the Pennington with a Mors," I may assure Mr. Wridgway that we are not only talking about it, but shall do it, and I hope no further objection will be raised by Messrs. Pennington & Baines to arrange a race in France extending over 500 miles; and, as we would suggest, each party to enter five vehicles, which must be guaranteed to be ordinary commercial cars—the new Pennington 125-guinea car on their part, the Mors 380-guinea dog-cart on our part. Should, however, Messrs. Pennington and Baines wish to enter a special racing car, we shall be pleased to accept same and put against it a special Mors racing car; but think it would be to the benefit of all parties interested to have this contest come off not later than three months after date.

Trusting that Mr. Wridgway will be present when this contest takes place and compare once more the speed of the Mors and the Pennington,

I am, yours faithfully,

Holland Park Avenue, W.

ED. E. LEHWESS.

March 15th, 1899.

#### MOTOR-CAR TRIAL GROUNDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Are there any privately owned places in London or the suburbs where an amateur can learn to drive and control a motor-car? I am anxious to buy a car, and with this in view have been favoured by several firms with "trial trips" on their cars. But, of course, I was not allowed to drive the vehicle myself, and I fear that if I do purchase one I would make a fool of myself if I tried to learn to control it on the public streets, and possibly be held liable for manslaughter or perhaps some less serious crime, owing to damage done to Her Majesty's lieges. Can you or any of your readers help me? \*

Yours etc.,

"PERPLEXED."

Penge, S.E.,

March 14th, 1899.

A DIVIDEND of 6 per cent. has just been declared by La Société des Voitures Automobiles des Etablissements Decauville Ainé, of Corbeil, France, a company formed about a year ago to manufacture the Decauville two-seated motor-voiturette.

THE Automobile Club offer a prize of twenty guineas for the best design for a poster to advertise motor-vehicles. It offers a further prize for the design of a costume for a motor-car attendant.

THE U.S. Consul at Magdeburg, Germany, has lately sent a report to the U.S. Government, in which he states that: "The report that a newly organized American Company is manufacturing auto-motor freight road waggons capable of carrying eight tons has been received in England with great interest. If American ingenuity has finally solved the problem of self-propelled road waggons, a big trade can at once be secured in Liverpool and the surrounding country, and throughout the commercial and manufacturing districts of England generally." The Consul adds that: "Liverpool has made the most thorough practical test of auto-motor freight road waggons, and it is frankly admitted both by expert scientific authorities and by practical business men, that this problem, at least so far as English attempts are concerned, has not yet been solved." However this may be, we have not yet seen any American-built heavy waggons to equal those of English construction.

\* We refer to this communication under the heading "Comments" in the present issue.—ED. M.-C. J.

## THE ADVENT OF THE ELECTRICAL MOTOR-VEHICLE.

THOSE who watch the progress of mechanical road locomotion cannot resist the conviction that the electrically-propelled motor-carriage is for the moment making greater headway towards successful finality than any other system of mechanical propulsion for road vehicles.

The problems presented in the successful designing of an electrical-vehicle are certainly not less complicated and diverse than those attending the perfecting of vehicles propelled by steam power, or by explosion or impulse engine, although the first mentioned, owing to the mobility of the power utilized, is perhaps less complicated in regard to transmission gear, speed changing devices, reversing gear, and other mechanical items. The ability to cut off power in the electrically-propelled vehicle also renders its designing less mechanically complicated than is the carriage actuated by petroleum spirit engines, which must of necessity run at a constant or nearly constant speed, no matter what the speed of the vehicle itself may be.

The difficulties encountered by the designer of electrical vehicles exist almost entirely in the finding of a suitable accumulator, and in so designing the body, etc., that it is possible for the carriage to attain a speed of about twice (or more) that of a horse-drawn vehicle, whilst itself weighing at least twice or thrice the weight and traversing exactly the same conditions of roads and pavings.

We do not for one moment intend to convey that these problems have been finally solved, although some very considerable advances have recently been made towards this end. Of course, it is quite well known that in regard to the battery problem the saving of weight must not be made the sole desideratum. It is quite possible to have an extremely light battery, but such a battery will have but a short life under the conditions attending its use in motor-vehicles. It is also possible to have batteries containing sufficient current for long runs, even up to 100 miles, but at present it is not seriously contended that the life of such batteries would tend to their adoption from a commercial point of view. We are told, however, that we are shortly to have what we will term a "long-distance" battery which will also have a long life, and withstand the rough usage which batteries in motor-vehicles have to undergo. But we have not yet seen it.

Returning now to the theme of our present article, it is simply wonderful how fast new electrical vehicles are being put upon the market. It is also curious to note that by far the greater number of these are of American origin. The motor-car industry is, on the whole, not in an advanced stage in the United States, but the constructors of that country are undoubtedly taking the lead in light pleasure carriages propelled by electricity. To mention only a few, we have the really elegant and excellent carriage of the Pope Manufacturing Company (the "Columbia"), that devised by Mr. Riker, the "Waverley," the "Orient," and some three or four others, whilst those of purely English design as yet on the market are designed on the Bersey, the Oppermann, or the Elieson systems. There are several of what may be termed Anglo-American design shortly to be put on the market, including those constructed on the Leitner and the Joel systems, whilst Riker carriages are to be built in England and Pope's "Columbia" in France for export to England.

Disregarding the electrical and mechanical problems of the electrical motor-carriage for the time being, it is certain that their conveniences make them an ideal vehicle for a lady's driving. The freedom from any great mechanical complication, the avoidance of the considerable lubrication necessary with petroleum-motors, and the freedom from dirt and emission of noxious odours, all appeal to the somewhat fastidious tastes of a lady. Moreover, the ease with which changes of speed are rendered possible without the labour inseparable from using speeding devices, the ability to bring

a vehicle to rest by simply shutting off power, and the considerably fewer number of handles, levers, and pedals necessary, all contribute to the electrical-vehicle appealing to a lady's taste.

The same advantages will also appeal to the City man who proposes to use a motor-vehicle for transporting himself between his home and his office; for even if the distance between these points is, say, twenty miles, he can, without unduly damaging his batteries, accomplish this with ease by having them re-charged during the day whilst at his office, and during the evening or early morning whilst at his home. What will shortly be wanted in London is a number of "garages," or dépôts in which such vehicles can be stored and charged during the day. There are a considerable number of these dépôts in Paris, and doubtless as the vehicles become more utilized in the future, these will also spring up in London.

We are convinced that in the coming season light electrically-propelled motor-carriages will be increasingly popular in London, and we look to see a considerable number of them "tooled" by ladies.

### MOTOR-CARS IN BELGIUM.

#### THE EXHIBITS AT THE BRUSSELS SALON DU CYCLE ET DE L'AUTOMOBILE.

THAT Belgium means to keep well to the front in motor-car matters is well evidenced by the seventh Salon du Cycle et de l'Automobile, which was opened at the Pole Nord, Brussels, on Saturday last, and which closes

FIG. 1. GENERAL VIEW OF KOCH MOTOR-CARRIAGE.

to-morrow, the 19th inst., for, just as was the case with the recent Salon du Cycle et de l'Automobile at Paris, the exhibits of motor-vehicles and cycles far outnumber those of cycles. We have only space this week to just briefly allude to the exhibits in the automobile section, but in subsequent issues we hope to publish complete descriptions with illustrations of the several new vehicles displayed. Entering the exhibition building the first stand is that of the Société Le Progrès Industriel, 14 Rue des Croisades, Brussels, which in addition to a number of machine tools exhibits a new light three-seated carriage built to the designs of M. M. H. Rumpf. The motor, which is of the petroleum-spirit type, has two balanced cylinders and gives, it is claimed, 6½ h.p. on the brake. The ignition is electrical, while the cooling of the cylinders is effected by means of a water-jacket. Four speeds, 8, 16, 28 and 45 kilometres per hour—and one backward motion are provided, all being controlled by a single lever within convenient reach of the driver. The motor and transmission gear occupies relatively a very small compass, and is entirely enclosed by the body of the car. Le Progrès concern is also we learn manufacturing 1½-h.p. motors suitable for tricycles and 3½-h.p. motors for voiturettes.

Quite a new vehicle is that which is exhibited by Messrs. Chas. Wilford et Fils, Ingenieurs-Constructeurs, of Tamise-les-Anvers, which takes the form of a four-seated *dos-à-dos*. The petroleum-spirit motor employed is of 6 h.p. It has two cylinders, and is arranged in the fore part of the vehicle. The ignition is electrical, or by means of a lamp as desired. Three forward speeds and one backward motion are provided. The transmission of the power of the motor to the rear road wheel shaft is effected by means of steel and raw-hide pinions, no chains being em-

ployed. The vehicle has a very substantial appearance, although it has one or two points about it which do not strike us favourably. Of these we may mention the unusual dimensions of the engine cover, and the fixing of the foot pedal controlling the band brakes to the outside of the carriage frame.

La Société des Automobiles Koch, of 37 Rue Chauveau, Neuilly, Paris, shows the four-seated motor-carriage, Fig. 1, first introduced to the notice of the public at the motor-car exhibition in Paris in June last year, and the feature of which is that the motor works with heavy oil, in contradistinction to the more generally-used petroleum-spirit. The motor, Fig. 2, is capable of developing 6 e.h.p., and comprises two cylinders placed end to end, with one explosion chamber in the centre, the one explosion giving a simultaneous impulse to each piston. The piston rods are each connected by cranks to connecting rods and thence to the fly-wheel shaft, which is fixed centrally below the cylinders, the engine being in this way exactly balanced. No carburettor is employed, the oil being simply "pulverized." The explosive mixture is formed in the chamber between the two cylinders, and is ignited by means of a porcelain tube maintained incandescent by a pressure burner. The admission valve is automatically actuated by the motor itself, a special regulator being provided to vary the admission in accordance with the power required. The motor, which weighs about 3½ cwt., runs at a speed of about 600 revolutions per minute; it is placed transversely in the rear portion of the carriage, and will, the makers claim, work equally well with heavy oil or petroleum-spirit. Three forward speeds—8, 16 and 30 kilometres per hour—and one backward motion are provided. The power of the motor is transmitted through spur-wheels running in an oil bath to an intermediary shaft, and from the latter to the rear road wheel axle through the usual driving chains and sprocket wheels. A novel feature of the carriage is that access to the front seats is gained not at the sides as is usual, but through a door in the front splashboard. The visible exhaust has been so far one of the main difficulties experienced with this car, but we understand that the Koch Company, who are represented in this country by the Automobile Association, of Holland Park Avenue, W., are at present engaged on experiments with the object of overcoming this drawback.

FIG. 2. SECTION THROUGH KOCH MOTOR.

La Société de Constructions Liegeoise d'Automobiles, of 85 Rue Lacressé, Liège, has on view several of its two and three-seated voiturettes. These little vehicles are already fairly well-known in motor-car circles in this country under the name "The Tourist"—they having been introduced by the Automobile Association, of Holland Park Avenue, W. The voiturettes are provided with motors of 3½ h.p. with electrical ignition, three speeds being available.

The Liegeoise Co. has recently acquired the patent rights in the Duryea petroleum-spirit motor-carriages, and of these a two-seated and a four-seated vehicle are displayed.

M. Lison, Ingénieur, of Ensisval, Verviers, who some time ago acquired the Belgian rights in the Gautier-Wehrle type of petroleum-spirit motor-vehicles, exhibits two examples of the many types of these carriages. The details of these vehicles have been fairly well described from time to time, so that it may suffice to briefly mention that the motor is a horizontal one—two or four cylinders, according to the power demanded—arranged transversely in the fore part of the carriage. The extension of the motor-shaft, which carries a friction clutch, terminates in a bevel wheel gearing with a similar bevel wheel on an intermediary shaft, which also carries the variable speed gear. From this first intermediary the power is transmitted through the requisite pair of spur wheels to a second intermediary shaft, which at its centre carries a spur wheel, gearing with a large spur wheel surrounding the differential gear on the rear road wheel shaft, the use of driving chains being in this way obviated.

A new two-seated voiturette is shown by La Société des Ateliers d'Echamps, of 31 Rue Frère-Orban, Brussels (Nord), a company which was only formed in January last. The vehicle, which has a very graceful appearance, is propelled by means of a two-cylinder petroleum-spirit motor located in the fore part of the carriage. The ignition is electrical; the carburettor is of the well-known Longuemare type, while, for cooling purposes, the cylinders are provided with radial discs. Three speeds

forward and one backward motion are provided, the power of the motor to the intermediary shaft being transmitted through spur wheels, and from thence to the rear road wheels by the usual driving chains and sprocket wheels. The vehicle is fitted with pneumatic tired cycle wheels, and is provided with wheel-steering; the weight completed being given as 250 kilog., or not quite 6 cwt. The D'Echamps Company is also constructing motor-tricycles with De Dion 1½-h.p. motors.

La Société des Anciens Etablissements Panhard et Levassor, of 19 Avenue d'Ivry, Paris, confines its exhibit to an example of the new two-seated vehicle exhibited for the first time at the recent show in Paris. As we hope to publish an illustrated description of this vehicle in an early issue, we will now merely remark that it differs materially from the Panhard vehicle to which we have hitherto been accustomed. The motor is a single cylinder one of 4 h.p., and is located in the rear portion of the carriage. Tube ignition is employed, while radial discs and a water-jacket provide for the cooling of the cylinder. Three forward speeds and one backward motion are available, while the steering is controlled by means of a hand wheel.

La Société Electricité-Mécanique-Automobiles, of 4 Digue du Canal, Cureghem, Brussels, show a new motor-vehicle which has been named "La Gracieuse," and of which a general view is given in Fig. 3. We were able to obtain but few particulars of this carriage, but we learn that it is provided with a 6-h.p. petroleum-spirit motor, fitted with both electrical and tube ignition, the latter being only brought into use should the accumulators give out. Another feature of the motor is in the method of cooling the cylinder. The latter is surrounded by a series of hollow and radial discs of aluminium through which a current of air is made to pass, the system being claimed to be not only effective, but an improvement on the ordinary radial discs.

FIG. 3. GENERAL VIEW OF "LA GRACIEUSE" MOTOR-CARRIAGE.

La Société des Ateliers Germain, of Monceau-sur-Sambre, which some time ago secured the Belgium patent rights in the Panhard-Daimler vehicles, and also in the light two-seated carriage of the Société des Automobiles Elan, of Paris, has already turned out about twenty vehicles. Plant is, however, we learn at present being put down to enable an output of three Daimler and six Elan carriages per week to be maintained. Examples of both types of vehicle are on view at the exhibition, but neither, being already well known, require a lengthy description at this time.

La Société des Automobiles N. Vincké, of Malines, has on view a number of its well-known—at least on the Continent—types of petroleum-spirit motor-vehicles, some of which are built on Benz lines, while others have vertical twin cylinder, etc., the motors being fitted in the fore part of the vehicle on the Panhard-Daimler system.

La Société des Voitures Automobiles des Etablissements Decauville Aîné, of 11 Boulevard Malesherbes, Paris, displays the Decauville two-seated voiturette, which has become very popular in Paris.

La Compagnie des Automobiles et Moteurs Henriod, of 7 Rue de Sablonville, Neuilly-sur-Seine, exhibits two motor-carriages and a couple of motor-tricycles, but as these are fully described in other columns of the present issue further reference to them here is unnecessary.

Motor-cars are also exhibited by La Société l'Automobile, 10 Rue de Bonne-Terre, Vleurgat-lez-Brussels; La Société Belgica, 92 Rue du Midi, Brussels; Messrs. Wallegem & Sooghen, Rue de la Concorde, Ixelles; La Société Générale Belge des Automobiles, 58 Rue de l'Arlon, Brussels; La Société Le Cyclodrome, 15 Chaussée d'Etterbeck, Brussels; La Société des Usines Delin Marché-aux-Poissons, Louvain (the Delin vehicles are fitted with Loyal petroleum-spirit motors); La Fabrique Nationale d'Armes, of Herstal; and La Société des Etablissements Pieper, 20 Rue des Bayards, Liège; while among the many exhibitors of motor-tricycles may be mentioned the following: M. C. Belot, 24 Rue de Poinçon, Brussels, who also exhibits a number of trailing cars for the same; M. H. J. Van Mallaert, 82 Boulevard du Nord, Brussels; J. M. Deprez-Joassart, Herstal; Messrs. V. Guillon & Co., 7 Rue Pletinck, Brussels; Messrs. Barrière & Co., 22 Rue Saint-Labin, Paris; and Messrs. Cudell & Co., of Aix-la-Chapelle, the German licensees of De Dion motors and motor-tricycles.

An automobile cycle and motor-car race will be held at Turin, Italy, on April 23rd.

We learn that a large new automobile Company with a capital of no less than \$25,000,000 (£5,000,000) has been formed at Trenton, N.J., U.S.A. The object of the company is to secure control of existing automobile concerns, including the Electric Vehicle Company—which operates the electric cabs in New York—the Pennsylvania Electric Vehicle Company, and the General Electric Automobile Company.

## NEW COMPANIES REGISTERED.

AUTOMATIC MAGNETO-ELECTRIC IGNITION COMPANY (FRANCE AND BELGIUM), LIMITED.

REGISTERED March 3rd, by C. H. Moore, 1 Avonmore Road, Kensington, with a capital of £15,000 in £1 shares. Object, to adopt a certain agreement, and to carry on business as electricians, manufacturers of and dealers in cycles, motors, and the component parts thereof, and as engineers and metal founders generally. The directors are F. R. Sims, R. Bosch, and C. H. Moore. Qualification, £50. Remuneration according to profits; minimum, £50 per annum each.

FRANKENBURG'S LIMITED.

THIS company has just been registered with a capital of £20,000 in £1 shares, to enter into an agreement with Hyman Frankenburg, of 28 Snow Hill, Birmingham, and to carry on the business of cycle, motor-car, and carriage manufacturers, dealers, agents, and proprietors, india-rubber manufacturers, engineers, fitters, founders, millwrights, smiths, saddlers, etc. The subscribers are: Samuel H. Greenberg, Mrs. Jenny Frankenburg, Thomas Barker, Hans Kaiser, Hyman Frankenburg, Mrs. Margaret E. Barker, and Ernest A. Helsby. Registered office, 28 Snow Hill, Birmingham.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, MARCH 24th, 1899.

[No. 3.

Published by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### Another Long "Non-Stop" Run.

MR. PEDLEY'S long non-stop run recorded in our last issue has been surpassed, it appears, by a longer run on a motor-tricycle, although up to the present we have received no information of a longer run of a car fitted with an engine having a water-jacket. Mr. S. F. Edge, perhaps one of the most enthusiastic of English motor-carists, writes us as follows:—"I had a long non-stop run on Thursday last. Starting from a few doors west of the Holborn Town Hall I journeyed to the Queen's Hotel, Coventry, in three hours fifty-three minutes without a stop on a De Dion motor-tricycle. I have both my oiling and arrangement for letting fresh petrol into the tanks so placed that they are controlled from the saddle, and I can then run for over 200 miles without a stop if everything goes right." Mr. Edge informs us that he went very slowly out of town over the very bad roads up to Barnet, and in fact took one hour and thirty-three minutes to reach Dunstable, which is only about thirty-three miles from London. After passing Dunstable, however, Mr. Edge must have travelled fairly quickly, as is proved by the average speed per hour over the whole distance. Mr. Edge states that he was in no way endeavouring to get the best work out of the tricycle, and sat quite upright during the whole journey, slowing up for every village. Mr. Edge also states that the more he uses the De Dion motor the more he is impressed with its powers and its capabilities. Throughout the whole journey he did not notice the motor miss a single explosion unless the sparking was deliberately turned off. Mr. Edge came back to London on his machine on Saturday in company with some friends, and records the fact that everything seemed as taut and trim at the end of the journey as it did at the start.

### Duty on Petrol in Victoria.

THE question as to the import duty to be imposed on petroleum spirit imported into Victoria for the use of motor-tricycles and vehicles has recently arisen. It has been, however, decided by the Customs authorities of that colony that no duty is to be imposed on such imports. Consequently Victoria automobilists will be able to purchase foreign refined spirit at its prime cost *plus* the cost of carriage. It is to be hoped that before long sufficient trade will develop to induce the starting of local refineries.

### The Potential Value of Petrol.

ACCORDING to Baron d'Alten in the *Chauffeur*, experiments that have been made have resulted in showing that two h.p. can be developed in a petroleum spirit motor per kilogramme of petrol. In boilers heated by means of ordinary petroleum one kilogramme of oil does not, he states, evaporate more than six kilogrammes of water, and as the engines connected with these boilers in motor-vehicles generally consume twelve kilogrammes of steam per h.p. this is equal

to two kilogrammes of petroleum per h.p., or four times as much as is necessary in an explosion motor to gain the same power.

### The Automobile Club's Easter Tour.

IN our last issue we gave the route of the tour organized by the Automobile Club, and this has undergone no material alteration at the time of going to press, excepting that on Easter Monday an alternative route to Winchester is arranged for in lieu of the suggested tour through the New Forest. The New Forest is beautiful to the pedestrian, but the public coach roads through lead over bleak, unsheltered hills, and we have personally a very vivid recollection of the trouble experienced in this spot on the Saturday before Easter Sunday last year. The gradient was a "stiff" one, and the side-wind almost sufficient to blow the car out of its course; heavy rain descended at the same time, and the result of the tussle between the elements and our car was that the latter and its mechanism was thoroughly covered with coarse flint-like grit, although it finally conquered all obstacles. The riders, too, were none too comfortable at the combined grit and rain showers which dashed against their faces. Under the circumstances, therefore, we think the Club's committee have been wise in not making the trip a compulsory one as a part of the journey to Romsey. Instead thereof the following alternatives are suggested:—Lyndhurst to Romsey *via* Cadnam and Ower, 8½ miles; or Lyndhurst to Beaulieu, by way of Beaulieu Road Station, and return *via* Hythe, Totton, and Ower to Romsey, a distance in all of 32½ miles. A further alteration has been made in regard to Tuesday's journey. Instead of proceeding from Winchester to Bagshot as originally intended, the route now decided upon is *via* Popham Lane, Basingstoke, and Hartley Row to Blackwater (32 miles), luncheon being partaken there, and the journey home to London being completed as originally suggested, *via* Virginia Water, Staines, and Hammersmith. The total of this last day's run is 63½ miles—if we are not mistaken, the longest run ever organized for one day in any of the Club's tours.

### Easter Trips— Motor-Car Spirit Supplies.

SEVERAL correspondents have written us pointing out the uncertainty in arranging trips for the Easter holidays, owing to the uncertainty of so arranging their stops that they can secure a supply of petrol without having the necessity of carrying cumbersome reserve tanks. We have ourselves experienced this difficulty, especially with motor-tricycles. We will undertake to supply any of our readers, who will send us a stamped directed envelope and a copy of the route proposed to be traversed, with a list of dealers selling motor-car spirit at the towns or villages *en route*. In order to assist our readers in forming their routes, we publish on the last page of the present issue a list of firms in a few towns who will be able to supply the needs of motor-carists with Pratt's deodorised motor-car spirit, as sold in this country by the American Oil Company, for which company the firms mentioned are local agents. All inquiries in regard to

dealers on the routes proposed for the coming Easter tours should reach us at latest by first post on Tuesday morning in order to secure a reply before Good Friday.

#### More Motor-Ambulances.

IN our last issue we commented upon the proposal of the Toronto Police Commissioners to employ electrical ambulance vans or trucks in conducting the ambulance work of the authorities. This week we have to record further advances in this direction. The first automobile ambulance ever constructed in the United States has been presented to the Michael Reese Hospital, Chicago, and is now in service. It was built in Chicago and weighs 1,600 lb., its speed approximating to 16 miles. Unfortunately information is wanting as to the motive power employed. We now learn that Mr. F. R. Simms has designed a vehicle for submission to the British War Office officials which is designed to act as an armed "scout," one or more to be attached to each regiment. The vehicle will carry a small Maxim gun in ordinary, but if desired this can be dismounted, and by slight additions the vehicle can be turned into an ambulance carrier.

#### A Coincidence.

MOST Londoners know that Messrs. Fuller, Smith & Turner, the well-known Chiswick brewers, employ motor-vehicles for conducting certain parts of the carrying department of their business. Mr. Fleetwood Fuller, a member of this firm is, like Sir Walter Gilbey, a great lover of horses and a well-known four-in-hand "whip." Mr. Fuller was recently trying a new pair of spirited horses when they bolted, with the result that their driver was thrown out of the carriage and severely injured. Fortunately it is not alleged that the horses were startled by the motor-vehicles employed by the firm, but in all probability Mr. Fuller would not have met with his severe accident had he adopted motor-vehicles for his private use as well as for business purposes. We trust Mr. Fuller will make a speedy and permanent recovery, and, although not desiring that he should cease his love and admiration of horses, we would commend to his attention as safe, reliable, and comfortable the latest forms of motor-vehicles.

#### Participants in the Automobile Club's Easter Tour.

IN another portion of this issue we give an account of the Automobile Club's Easter tour as amended up to the time of our going to press with this issue. From latest reports it appears that 20 vehicles will take part in the whole of the tour, and that 11 additional vehicles will participate in different parts of the tour. Those taking part in the whole of the tour are as follows: Vehicle No. 1 (Benz), Mr. Frank H. Butler and friend; No. 2 (Panhard), Mr. S. F. Edge and Mrs. Edge; No. 3 (Panhard), Mr. C. Jarrott and friends; No. 4 (Ariel motor-tricycle), Mr. J. W. Stocks; No. 5 (Papillon motor-tricycle), Mr. Townsend; No. 6 (Benz Ideal), Mr. Herbert Capel; No. 7 (motor-wheel), Mr. F. R. Simms; No. 8 (Iveagh phaeton), Mr. Charles Cordingley, Mrs. Cordingley and Miss Pursehouse; No. 9 (Mors), Dr. Lehweß and friends; No. 10 (Orient Express), Mr. Zacharias and Mrs. Zacharias; No. 11 (Koch), Mr. Atkins and friends; No. 12 (Daimler), Mr. Ernest Estcourt and Mrs. Estcourt; No. 13 (Clarkson-Capel steam victoria), Mr. Thomas Clarkson and friend; No. 14 (Benz, 5 h.p.), Mr. Lyons Sampson and friends; No. 15 (Benz Ideal), Mr. and Mrs. Kitto; No. 16 (Peugeot-Daimler), Mr. and Mrs. Armstrong; No. 17, Club wagonette (Daimler), driven by Mr. Ernest M. Instone; No. 18, Club phaeton (London Motor-Van and Wagon Co.); No. 19, the Club luggage van (London Motor-Van and Wagon Co.); No. 20 (Simms' quadricycle), Mr. Hankinson and friend. It is also probable that another club vehicle will start, bringing the total for the

whole tour up to 21. Among those riding in the Club vehicles are Mr. Louis d'Egville, Mr. Worby Beaumont, Mr. Staplee Firth, Mr. David Waterlow, Mr. Holland Tringham, Mr. A. C. Poole, and Mr. C. Johnson (Secretary) and Mrs. Johnson. Amongst those who will participate only in parts of the tour are the following: Mr. and Mrs. W. C. P. Wills (Benz), Slough to Reading; Dr. Acworth (De Dion tricycle), Brentford to Lyndhurst; Mr. R. E. Phillips (De Dion tricycle), London to Lyndhurst; Mr. and Mrs. Buttemer (Benz), Salisbury to Romsey; Mr. and Mrs. J. A. Kooser (Lutzmann), Salisbury to Lyndhurst; the Hon. John Scott Montagu, M.P., Lyndhurst and Beaulieu to Romsey; Mr. H. A. Hewetson (Benz), Lyndhurst to London; Mr. H. Edgerton (tricycle), Lyndhurst to London; Mr. J. H. Knight (Benz), Winchester to Blackwater; Major-General H. P. Montgomery (Daimler), Romsey to Basingstoke; Mr. and Mrs. H. A. House and party, seven in all, Lfui steam Wagonette, Salisbury to Winchester.

#### A Canadian Electric-Vehicle.

IF the news our Toronto correspondent forwards us proves correct in all details, it would appear that Canada is far in front of us in building a light electrical motor-vehicle of moderate weight and fair range of action. Our correspondent describes the vehicle in question, which is the invention of Mr. W. J. Still, of Toronto, as follows:—Total weight, 400 lb.; battery weight, 180 lb.; range of action, 30 miles without recharging; speeds, 8 to 15 miles per hour; capacity, two persons and 50 lb. of baggage; four forward speeds, reverse, 1 electric brake; h.p. of motor, 3½, weight, 70 lb.; current used on ordinary roads, 15 ampères; length and width of wheel base, 4 ft. in each case. The steering is effected by the hind wheel, controlled by a hand lever conveniently placed, and so jointed that it can be turned out of the way of persons entering the vehicle. The controller is fitted with an indicator showing the effect of the power on the motor, whether in a forward or backward direction, and a key plug is used so that the machine cannot be tampered with when left unattended. The motor is suspended over the front axle, which carries two wheels, the usual spur gearing being employed to convey motion to the road-wheels. The framework of the vehicle is steel tubing, and the body itself is made of basket-work. The batteries are carried at the back partially over the rear wheel.

#### Electrical Ignition Apparatus.

OF the many French firms who have set themselves out to meet the demand for electrical accessories in connection with petroleum motor-vehicles in which the ignition of the explosive charge is affected electrically, La Société Le Carbone, of Levallois-Perret, and 36 Lime Street, London, E.C., occupy a prominent place. Chief among their specialities are the "Sans Pareil" dry cells, for which a maximum of output with a minimum of weight and dimensions is claimed. Four sizes of the cells are made, and are supplied singly or in tin or oak boxes as desired—in the former in sets of four, and in the latter of four, five, or six cells. In use on motor-tricycles their life extends, it is claimed, from 300 to 500 hours, according to the condition in which they are employed. Two sizes of cells, which in sets of four weigh respectively 16 lb. 7 oz. and 17 lb. 9 oz., are made for motor-tricycles, a slightly larger size—weight of four being 23 lb.—for light motor-carriages, and a still larger size for heavier carriages. To meet the requirements of an induction coil, taking as little current as possible, which is recommended in use with the "Sans Pareil" cells, Le Carbone Company have also introduced a coil known as Rossel's, of which we hear very good accounts. These coils are specially wound, and are made to work with or without contact breakers, and it is claimed for them that they meet the great *desideratum* of giving a spark at a desired time without failing. Any *chauffeur* who has had trouble with his

electrical ignition can be recommended to inquire into the merits of Le Carbone specialities.

**Wheels and  
Tires for Motor  
Vehicles.**

Just when the question of wheels for motor-vehicles is absorbing a good deal of attention in this country comes the announcement that Messrs. Schneider & Co., of Le Creusot, France, who may be termed the Armstrong-Whitworths of France, have lately devised a new form of carriage wheel, in which provision is made whereby any looseness or play of the spokes in the felloe due to wear or to the effects of the atmosphere may be readily taken up. An idea of the new arrangement, which is more especially intended to be used in connection with wheels built up partly of wood and partly of metal, will be obtained by a glance at the accompanying illustrations. The spokes *R* are bolted to

the hub; the felloe *J* is built up of several segments, each connected one with the other, and with the tire. The outer ends of each of the spokes are provided with a hexagonal-sided metal cap *A*, on the outside of which is a threaded projection, so that it may be screwed more or less deeply into the nut *b* formed in the interior of the shoe *B* which grips the sides of the felloe. This nut is rabbeted into the felloe; the hexagonal form of the spoke-caps permits them to be turned by a wrench, and in this way the length of the spokes may, within a certain limit, be varied so that each shall exert an equal radial pressure on the felloe.

**Simms'  
Motor-Wheel.**

On Tuesday last, in the midst of a blinding snowstorm, a party of enthusiasts gathered at Clapham to witness some demonstrations with a vehicle sold by the Motor Carriage Supply Co., Ltd., the invention of Mr. Frederick R. Simms, and known as Simms' "Motor-Wheel." The vehicle is a three-wheeler, the frame being of quite novel design, and, as Mr. Simms is careful to emphasize, is specially built to carry a motor, and is not a conversion of a pedal machine into a motor-vehicle. The two front wheels are the drivers and the rear wheel the steerer. The motor is a horizontal single-cylinder engine placed with the explosion chamber in front, immediately under the front axle, to which it gears by chain gearing, the axle carrying the usual "jack-in-the-box" or differential gear. The position of the engine, which is provided with longitudinal fins or radiators, permits it to receive the whole of the air currents set up by the passage of the vehicle along the road. Starting is effected by the usual pedal and chain gear, a compression release being provided. A peculiarity of the machine rests in the

ease with which its speed of travel can be controlled. This is rendered possible by the employment of the Simms' timing gear, which is used in conjunction with the same gentleman's magneto-electric firing device. The feeding of explosive vapour is constant and positive, a carburettor of the "Phoenix" or constant-level float type being provided. The whole control of the vehicle is perfectly arranged, and, owing to the automatic devices mentioned, only the steering-wheel and the timing control lever have to be manipulated, with the exception of the two brakes provided, which are ample for pulling up the vehicle in a very short distance even when going at full speed. The b.h.p. of this motor is given as  $1\frac{1}{2}$  h.p., and the average speed over fair give-and-take roads fourteen miles per hour.

**Motor-Car  
Services in Rural  
Districts.**

For the third week in succession we have to record advances in the provision of automobile public vehicles in various districts. Indeed, the advances are so numerous that we can hardly keep pace with them. We hear that a service is to be started at Brighton, but in view of a recent prosecution for fast driving, and more especially in view of the expressed opinion of the magistrate's clerk that a pace of four miles an hour was sufficiently fast for motor-vehicles, it would not appear that the owners of the Brighton motor-car service will have a very pleasant time of it. Another scheme is for providing Hastings with a service running between that town and certain popular places in the vicinity. Here there would appear to exist a vast field for the employment of motor-vehicles, and there should be every chance of the venture returning proper dividends. We mentioned in our last issue the scheme for starting a service at Sunderland but since then we learn that instead of providing six cars, as originally intended, the number will be increased to twelve. In this neighbourhood more services are proposed; for instance, we hear of two at Newcastle, and in addition others at Carlisle, Maryport, as well as at Coniston and several places in the Lake District.

**The Adoption of  
Motor-Vehicles  
for Public Hire in  
New York.**

THAT motor-vehicles are becoming more popular for public hiring is proved not only by the constant succession of new schemes formulated with a view of starting such public services in Great Britain, but also by the adoption of similar conveniences in the cities of America, in those of the European Continent, and in various places throughout the world. The successful introduction in a community of any striking innovation takes time, as the masses of the people have to be gradually educated up to the new condition of things, and the placing of motor-vehicles at the disposal of the public was no exception to this rule. Many persons of a conservative turn of mind even now prefer to travel in a cab behind an emaciated and slow-moving horse to risking their lives—as they suppose—in a vehicle the operation of which to them seems bordering on the mysterious. In this, history is simply repeating itself, as the same conservatism and timidity were exhibited by our grandfathers in the case of the stage-coach and the railway train. This conservatism has been so marked in some cities and been carried to such an extreme that the motor has necessarily been a dismal failure financially, owing to the prejudices of the public. All this is now being altered, and the conservatism of the public is giving way, with the result that the reaction is so great that motor-vehicles are now in very many districts received with joyous acclamation. In New York the Electrical Vehicle Company, which has recently being reconstructed with a very greatly increased capital, proposes to put an additional 200 vehicles on the streets; of these twenty-five will be of the coupé pattern, seventy-five of the four-wheeled "hansom" variety (an example of these has recently been seen in London), fifty full broughams with a capacity

of five persons, and fifty three-quarter broughams carrying three persons. In Paris, as recorded in our issue of the 10th inst., a large service of electric-cabs is being prepared, and in London itself a great extension of the number of licensed and unlicensed electric cabs, coupés and broughams is promised at an early date. In large centres, electricity seems to hold its own against petroleum-spirit motors. So soon, however, as capitalists recognise the fact that a motive power that can be successfully used to transport nine persons can be quite as profitably used for smaller vehicles, we shall probably witness an extension of mechanically-propelled cabs in the suburban districts, if not in the heart of our cities.

#### Primary Batteries for Ignition Purposes.

ALTHOUGH in general secondary batteries or accumulators are so much disliked by users of motor-cars as a means of furnishing the necessary current for effecting the ignition of the explosive charges of the motor, yet it is extremely difficult to obtain really satisfactory primary cells. This arises principally by reason of their usually low e.m.f. and the want of constancy. This low e.m.f. generally requires the use of four cells, and where room is limited, as is the case in many types of motor-vehicles, this has caused their rejection in favour of the secondary cells, which possess other disadvantages perhaps equally as undesirable as is the cumbrousness of the four primary cells. A correspondent, whose opinions we value highly, informs us that there has been recently produced abroad a new form of primary cell, which from our correspondent's account would appear to be without many of the disadvantages of most primary cells, although it possesses others by reason of its not being of the "dry" type. So far as we are aware the combination used in this cell has never before been used in primary batteries; indeed, we believe that this is the first time that lead peroxide has been successfully used in such a cell, although, of course, it has long been employed in secondary cells. In this cell lead peroxide and zinc amalgam are used, with dilute sulphuric acid as the electrolyte. Our correspondent states that the e.m.f. of the cell is 2.45 volts, which is certainly the highest within our knowledge. The quick depolarization obtained by the use of these elements, together with the low resistance of the electrolyte and its high voltage, probably makes this cell the most powerful on the market. We are informed that "its output is phenomenal for its size—5 inches high by 3 inches square—and that its recuperative powers are extraordinary." It is also said that the battery will give, on ordinary circuit work, a discharge of 40 ampère hours. Our correspondent also states that as "there is no local action in open circuit the cell keeps its charge indefinitely; there is an entire absence of creeping salts and corroded connections, and no liability of destruction from short-circuiting." It would also appear to be cheap in renewals, for when the cell shows signs of weakness the electrolyte is thrown away and replaced; when it again grows weak the negative element or lead peroxide stick is replaced by a new one. The positive or zinc element will generally outlast two negative elements, but when this is exhausted it can be replaced also. We have taken measures to secure a fair test of these batteries, although doubtful of their utility on motor-vehicles, and will take care that our readers are kept informed of their performances.

#### The Tire Question for Motor-Vehicles.

WHILST we in England have been struggling with the tire question ever since the re-introduction of motor-road vehicles, the constructors and designers of similar vehicles in America have also been plagued by the apparent difficulty of the solution of this problem. The London Electrical Cab Company has been twitted frequently with not having made a financial success of its first year's operations,

but apparently no allowance is made for the fact that during that period only a very few vehicles—not sufficient to recover all establishment expenses—were in operation. We cannot hope to give the whole of the many reasons which caused the Company to restrict its service, but we are quite confident that Mr. Bersey will support our contention that the "tire question" was one of the leading factors both in restricting the number of vehicles in operation and in making their running commercially unsuccessful. "Wheels" have also proved a trial to all concerned in the industry in Great Britain, and even now it is a question open to serious discussion whether the right type has yet been adopted. In France, too, the tire question has proved a stumbling block to the building of motor-vehicles for hiring in the public streets, owing to the commercially unsatisfactory results of trials of various types of tires. The difficulty has, it is hoped, been solved in France by providing the steering-wheels with pneumatic and the driving-wheels with solid tires. Were the streets of our cities paved with the best materials little or no trouble would ensue, but the granite cube, the rut-worn macadam, and the pitted soft-wood pavings are the cause of most of the troubles. In New York the Electric Vehicle Company have tried over twenty separate and distinct types of tires; probably others will have to be proved before satisfactory results are obtained. Mr. Condict, of the Electric Vehicle Company, recently stated publicly "solid, single and double-tube pneumatic, cushion, clincher, sectional, protected and unprotected have all had, or are to have, a trial. Their faults are many, their virtues few, and the Company are still on the search. Some eminent authorities in the motor-vehicle field had said that the solid is the only tire. They are rendering judgment without full knowledge of the facts, and from a purely local standpoint." It is just this point of local knowledge which is at the root of all the difficulties. If one type of paving were used throughout a city most of the difficulties would disappear, but whilst the paving consists of "patches" of differing materials with varying surfaces, so long will the tire question remain without a completely satisfactory solution.

#### Bedford and its Motor Service.

WE have spoken in a previous issue of the formation of a syndicate to provide the public with another motor-car service, the present proposed route being from Burnham Road Bridge to Kempston via St. Peter's Green. Mr. G. Salmon, of Newport Pagnell, is building the bodies of the vehicles to be put on this service, and the Motor Manufacturing Co., Ltd., are furnishing the frames and the mechanical parts.

#### Motor-Racing and Pacing.

As will be seen by reference to our correspondence columns, Mr. F. S. Edge has had some correspondence with the National Cyclists Union in regard to a rule recently passed by that body seeking to control motor-pacing and motor-racing on the track. For our own part we deprecate the employment of motor-vehicles in either of these ways, holding the opinion that their construction does not permit their developing full speed on a banked track, and further that their use in such cases is only advocated with a view to revive the decaying public interest in the somewhat discredited cycle track races. We hold the opinion, however, that if these vehicles are employed for the purpose mentioned it would be well that the N.C.U. should more definitely explain what class of vehicle they desire to control. The N.C.U. cannot for one moment be permitted to control any other than track-racing of motor vehicles in conjunction with bicycles, and we are quite sure that every automobilist will resent in the strongest possible way any attempt of this, or any other outside body, to control the movements or the uses of their vehicles excepting in the direction intimated.

### A Motor-Car Accident.

THE daily papers of Monday last recorded with the customary exaggerations a motor-car accident which occurred on Sunday in Croydon. It was reported that Mr. Harvey lost control of the vehicle, and was, with his wife, thrown out of the car, he being found to be suffering from concussion of the brain. Mrs. Harvey, of Kaliar, Normanton Road, South Croydon, has very kindly furnished us with a true account of the accident. From this it appears that Mr. and Mrs. Harvey went out on Sunday morning last in their Benz car, Mrs. Harvey having control of the steering-lever. This was Mrs. Harvey's second attempt at controlling the directing of the car, and, in order to bring her knowledge to perfection, Mr. Harvey switched the engine over to the high gear. It was owing to this that the accident happened, for Mrs. Harvey was not prepared at the moment to exercise the delicacy of steering necessary on the high speed. At the time Mrs. Harvey held the steering gear by her left hand, and the sudden increase of speed and the want of perfect control forced the car on to the kerb, with the result that it turned completely over on to Mr. Harvey, Mrs. Harvey being thrown out. The accident, fortunately for Mr. Harvey, has not resulted in any serious injuries; he has certainly a nasty flesh wound on the back of his head, but his medical advisers hold that he will be quite himself again in two or three days. We congratulate Mr. and Mrs. Harvey on their escape, and would point out that the need of a training ground is emphasized by this accident in the public street.

### The Lanchester Petroleum-Spirit Motor-Carriage.

A CORRESPONDENT sends us a few brief particulars of a new petroleum-spirit motor-carriage, constructed by Mr. F. W. Lanchester, of Birmingham, on which he had recently the opportunity of a short trip. The vehicle takes the form of a two-seated phaeton, a striking feature being that notwithstanding the small seating capacity the motor is capable of working up to ten h.p. The motor, which is arranged at about the centre of the frame, under the seat, comprises two horizontal cylinders facing each other in the same line. Two connecting-rods are attached to each piston. There are two cranks independent of each other, and two fly-wheels also independent of each other, but keyed respectively to the two crank shafts, one of which is 3 in. above the centre line of the engine, the other 3 in. below it. One connecting-rod from each piston goes to the upper crank pin and one to the lower, a kind of diamond-shaped linkage when the pistons are at mid stroke being thus formed. It is difficult to describe the Lanchester motor without an illustration, which, however, we hope to be able to publish at a later date. It may here be stated that the two crank shafts revolve in opposite directions. To counteract any vibration balance-weights are attached to the connections of the crank webs. The ignition is effected electrically either by a magneto machine or by means of a couple of storage cells. A hit-and-miss governor is fitted to the motor, and by means of small levers within convenient reach of the driver's hand the rate of sparking can be advanced or retarded as desired. The quality of the explosive mixture can also be varied, but this is really unnecessary once the best position has been found. Another feature of the Lanchester motor-carriage is to be found in the transmission gear, the margin of power in the motor making it possible to regulate its speed within considerable limits by the governor alone, and without the employment of a variable speedgear. The motor drives a friction disc, against which a plate is held by depressing a lever; this plate is keyed to a shaft carrying a worm, which gears with a large worm wheel, inside which is mounted the differential gear on the rear road-wheel axle. When the worm shaft disc is pressed against the motor disc the

worm rotates normally at the same speed as the motor; when the disc is drawn back it is forced against fixed stops, which act as a powerful brake. The steering is effected by a lever operated by the right hand of the driver, the wheels being mounted on independent axles, and coupled by a new design of compensating gear. The "body" is designed separately from the frame of the vehicle, so that different types of body can be fitted to the same frame.

## STIRLING'S NEW MOTOR CARRIAGES.

WE illustrate herewith two of several new forms of vehicles which Stirling's Carriages, Ltd., have recently placed on the market. It will, we think, be admitted that they show a great improvement on many of the older designs.

FIG. 1.

Comfort has not been sacrificed to appearance, however; indeed, the aim of the constructors has been to gain increased convenience whilst designing the vehicles on the most graceful lines possible on the somewhat ugly and "straight" Panhard frames. The engine-covers, too, have been modified, and possess a less bulky and "typewriter-cover" appearance than is usual with British vehicles of this type.

FIG. 2.

Each carriage is fitted with a 4-h.p. nominal engine developing  $5\frac{1}{4}$  b.h.p., and the transmission and speed-changing devices are on the usual British adaptation of the Panhard system.

The wheels, whilst retaining all necessary strength, have been designed to give a "light" appearance, and the carriages as a whole are extremely creditable productions of the firm, which is, by the way, one of the oldest firms of carriage builders in North Britain.

# The Filtz Rotative Motor.

FIG. 1.

FIG. 2.

THIS motor, which we illustrate in Figs. 1 and 2, is one of the latest and most novel productions brought under our notice. In practice the motor is constructed with any desired number of cylinders, although in the drawings it is shown with four only. The cylinders *C* are connected together and fastened on a gear-case *B*, as is shown quite plainly in the drawings. In this way the gear-case with its attached cylinders forms in effect the fly-wheel of the motor, as the whole revolves round the centre shaft. Each of the cylinders *C* is provided with a piston *P*, which by means of the connecting rod *E* acts on the crank *M*. The crank is supported in bearings fixed on the gear-case *B*, and carries, moreover, the spur-wheel or pinion *D*. It is obvious, therefore, that the cylinders receive a rotative motion around the main axle *A*, and if a pulley or cog-wheel or a friction plate is fixed on the cylinders as shown in the drawings, motion is communicated by its means to the propeller shaft of a boat or the main or intermediary axle of a road carriage. The axle *A* carries a cog-wheel *R*, which is constantly in gear with the pinions *D* carried on each of the four cranks *M*. It is therefore evident that when the motor is in action the piston rods acting on the cranks *M* communicate motion to the pinions *D*, which consequently turn round the fixed cog-wheel *R*, and so communicate motion to the gear-case cylinders and attachment. When the cylinders are designed to work in pairs, as is the case shown in the illustrations, it is considered advisable, in order to avoid the vibratory reactions of the explosions, to have the two opposite cylinders to work in unison. The explosive gases are admitted to the cylinders, first through the hollow axle *A*, which communicates with the chamber *I* by means of the tube *S*, and their admission is controlled by the valve *T*, entering the explosion chamber of the cylinders by the tubes *J*. The burnt gases are exhausted through the exhaust valves into the hollow rim *K* by means of the tubes *H*. The exhaust pressure is broken up by two choking tubes *H* and *V*, the exhaust to the atmosphere being accomplished without noise. As shown in the drawing, the explosions take place one after the other in each of the four cylinders; the single cam fixed to the main axle *A* opening each of the four exhaust valves in turn. The admission valves are automatic, opening as usual on the inspiration stroke of the engines. The rim *K*, it will be noticed, acts as a brace, holding the four cylinders rigidly, and forms also a part of the "fly-wheel." The ignition is electric, the sparking being con-

trolled by a four-branched commutator which switches the current into the ignition plug of each cylinder every time the brush *Y* comes into contact with one of the copper blocks on the insulated brush cam. In the illustration the piston of the top cylinder is at the end of its stroke, and the exhaust next takes place. As the pinion *D* guides this cylinder into its next position, so the exhaust takes place, each cylinder, of course, working on the well-known Otto cycle. As the pinion *D* is one-half the size of the cog-wheel *R*, each cylinder will have effected two complete revolutions, whilst the whole system makes one turn round the central axle. Thus for every complete turn of the whole system round the axle there are four explosions, one taking place in each cylinder. As four impulses are given per revolution of the "fly-wheel," the torque is very constant and vibration is avoided. It will be agreed, we think, that this motor is very novel in design, and if it be properly built it would appear that it should give excellent results. We have seen a motor built on this principle, weighing 66 lb., giving out on the brake  $2\frac{1}{2}$  h.p. at 600 revolutions per minute. It was of the same design as shown in the drawing, and measured 56 centimetres in width and 60 centimetres high.

THE date of the commencement of the French Automobile Club's accumulator competition has, we learn, been postponed to April 24th.

THE Washington Automobile Company is the name of a company which has just been formed at Washington, U.S.A., with a capital of £10,000.

THE 1899 list issued by the Kingsland Manufacturing Company, of King Henry's Walk, N., contains some interesting information about their machines and motor-tricycles.

THE title of the concern hitherto known as Messrs. Henri Michaux & Co., Société d'Etudes pour le Développement de l'Automobilisme en France, of Paris (66 Rue Caumartin), has been changed to La Société Commerciale du Cycle et de l'Automobile (Lasne, Delaye & Co.).

THE EAST KENT MOTOR-OMNIBUS COMPANY, LTD., the prospectus of which was advertised last week, has gone to allotment, ample capital having been subscribed. The Company has been formed for the purpose of running the Liquid Fuel Company's omnibuses.

# Leaders in Mechanical Road Locomotion.

No. 2.—MONSIEUR EMILE LEVASSOR.

**M**ONSIEUR EMILE LEVASSOR, whose untimely death on April 14th last year was reported to have occurred through a slight accident met with in the Paris-Marseilles race, was a gentleman whose name is almost as well-known and appreciated in motor-car circles in England as it is honoured and respected in France.

To Monsieur Levassor is due, perhaps more than to any other man, the credit for having revived the public interest in mechanical road locomotion. He it was who acted as foster-father to Herr Gottlieb Daimler's engine, and to his energy and perseverance is due in a great measure the success with which that engine has been employed in mechanical road locomotion.

Born in the year 1844, Monsieur Levassor passed through the "Ecole Centrale" as a student and finished his early education in 1864. He subsequently spent a few years in the establishment of John Cockerill at Seraing, and next joined the staff of M. Durenne at Courbevoie.

In the year 1872 he commenced his connexion with the house of Perrin & Panhard, a connexion which was only severed by death in 1898. In the first-mentioned year he became a partner in this old-established business, and became the senior member of the firm on the death of Monsieur Perrin.

It was in the year 1876 that Monsieur Levassor's firm took up the building of gas-engines, principally for Monsieur Sarazin, who held all the French patent rights in the inventions of Dr. Otto. In course of time Monsieur Sarazin also acquired the French patent rights in Herr Daimler's inventions for petroleum and petroleum spirit engines, and he transferred the rights of building these to Messrs. Panhard and Levassor; in this way Monsieur Levassor became the constructor of the first Daimler engine built in France.

In 1887 Monsieur Sarazin died, and his widow continued to grant Messrs. Panhard & Levassor licences to manufacture Daimler engines. Ultimately, however, Monsieur Levassor married Madame Veuve Sarazin, but even now Madame Veuve Levassor still holds in her own right the Daimler patents for France and Belgium.

From the time that Monsieur Sarazin licensed Messrs. Panhard & Levassor to manufacture under the Daimler patents, Monsieur Levassor devoted himself to the solution of the problems connected with the question of mechanical locomotion on common roads, applying his energies more especially to utilising the Daimler engine. Ultimately complete success attended Monsieur Levassor's constant efforts, and in the year 1894 his carriages obtained the premier

positions and the highest awards in the now world-celebrated Paris-Rouen race.

In the year 1895 Monsieur Levassor first applied the improved form of Daimler engine, known as the "Phoenix," to a road carriage, and in that year again carried off premier honours in the Paris-Bordeaux-Paris race, accomplishing the distance in 48 hours 48 minutes without dismounting from his seat in the vehicle. Not only did this performance prove the great endurance, tenacity of purpose, and dogged perseverance of Monsieur Levassor, but it also proved conclusively that carriages constructed on his system and fitted with the

Phoenix-Daimler engine were reliable vehicles, his carriage accomplishing the whole journey without one single breakdown or stoppage for adjustment or mechanical repairs.

It was this magnificent performance which proved conclusively to the public that mechanical road locomotion was within the bounds of possibility.

Not content with the success already gained, Monsieur Levassor day by day laboured to improve and perfect the mechanical details of his system, and in 1896 he drove in the Paris-Marseilles-Paris race the first vehicle constructed with a 6-h.p. Phoenix-Daimler engine. Three months after this race his labours were brought to a conclusion by his untimely death, which, as we have mentioned, was held to be primarily due to the severe fall and shock sustained by Monsieur Levassor owing to his car running over a large dog during the Paris-Marseilles race and thus capsizing.

Such is in brief the history of the too speedily ended life of Emile Levassor, a man universally liked by colleagues, employes, friends, and acquaintances; a man of far-seeing and clear-headed designs, of indomitable energy and perseverance, and one

whose personality the "new industry" could ill afford to lose.

It is well to remember that all the English-built cars employing the Daimler-Panhard system owe their existence to the drawings and work of Emile Levassor; it would be but a graceful recognition of his work if the system known in England as the "Daimler-Panhard" were termed the "Daimler-Levassor," and so far as this Journal is concerned, to mark its appreciation of the work of Monsieur Levassor, this term should be used in its columns in the future.

DICK FARMAN.

UNDER the patronage of the French Automobile Club, the Veloce Club de Tours is organizing a motor-car race between Tours and Angers and back, to be run off on September 10th next.

THE LATE MONSIEUR EMILE LEVASSOR.

## MOTOR-CARS ON THE CONTINENT.

### Self-Propelled Omnibuses in Paris.

THE French Department of the Meuse has made a formal contract with two persons for running a regular line of self-moving omnibuses over a public highway twelve miles long, between two railroad stations. The vehicles are to have seats for fourteen passengers, make the round trip at least three times daily, and the fare is limited to 1½d. per mile. Express goods will be carried on these vehicles, which must be able to carry 2,200 lb. of goods besides the passengers. The speed is limited to 12½ miles an hour. The contract also provides for the carriage of ordinary freight by a traction-engine drawing two waggons, with an aggregate capacity of 11,000 lb. Two classes of freight are provided for, with maximum rates of 12 and 15 cents. per ton per mile. A subsidy is granted for both passenger and freight service.

### The Lutzmann Reconstruction.

WE learn from a German correspondent that the firm of Adam Opel, of Rüsselsheim, cycle and sewing-machine manufacturers, have taken up the manufacture of motor-cars. In order not to waste time in unnecessary and expensive trials, the firm have acquired the plant of Herr F. Lutzmann, Dessau, together with the patents and stock, all of which, including a well-drilled staff of workmen, have been transferred to Rüsselsheim. The new factory is entirely distinct from the old establishment, and is under the management of the former proprietor of the Dessau firm, Herr Lutzmann, who has entered the new undertaking as director.

### Wheels for Motor-Cars.

AN interesting article on "Wheels for Motor-Vehicles" from the pen of Gaston Sencier appears in a recent issue of *La Locomotion Automobile*, a perusal of which goes to show that the question of the most suitable type of wheel for automobile vehicles is far from being settled even in France. The author makes no suggestions as to the best type of wheel, but draws attention to the great variety of types in use by different makers, and urges that more attention should be devoted to the matter, the wheels in his opinion, as in ours, forming a very important part of a motor-car.

### French Motor-Cars in Belgium.

IT is announced that a Belgian concern, La Société des Ateliers Snoeck, of Ensival, has acquired the patent rights in the motor-carriage designed by M. de Riancey, of Paris. The vehicle is propelled by means of a petroleum-spirit motor, the feature being that the engine, together with the whole of the transmission gear, is mounted on the front wheels, as in the Prétot and Amiot-Péneau "avant-trains."

### Motor-Car Races at Nice.

THE attention of the French automobile world is just now centred on the doings at Nice, where the present week has in society and sporting circles been almost entirely given over to motor-vehicle races. On Tuesday two races were run, one for motor-cycles and carriages, between Nice, Castellane, Puget, Thénières and Nice, a distance of eighty kilometres, and one for touring vehicles, between Nice, Cagnes, Magagnosc, Tourettes, Gattières and Nice. On Wednesday all the competing vehicles were placed on exhibition at Nice, while yesterday was devoted to a series of mile races along the Promenade des Anglais. To-day's programme comprises a competition as to the most comfort-

able and elegant motor-carriage, and a race from Nice to Monte Carlo. This latter is divided into four sections—(1) Two-seated carriages, (2) four-seated carriages, (3) six and more seated carriages, and (4) motor-cycles. The week's festivities will be brought to a close to-morrow by an automobile *rallie-papiers*, or following a "paper scent."

### Electrical Vehicles in Germany.

DIE GESELLSCHAFT FÜR VERKEHRS-UNTERNEHMUNGEN is the name of a new company which has just been formed in Berlin, with a capital of £90,000, to manufacture and operate electric motor-vehicles. The new company is very influentially supported, the Motorfahrzeug und Motorenfabrik, of Berlin, and quite a number of the leading German electrical engineering concerns, including Messrs. Siemens and Halske, of Berlin, and the Pollak Accumulator Co., of Frankfort, being interested in the new undertaking.

### Dutch Postal Motor-Vehicles.

THE Dutch Postal authorities are, we learn, about to carry out some trials with motor-vehicles. Offers to submit vehicles were received from about twenty firms, and out of these the following four concerns were selected: The Daimler Motor Co., Limited, of London; the Daimler Motoren Gesellschaft, of Cannstatt, Wurtemberg; La Société des Automobiles Peugeot, of Audincourt (Doubs), France; and Messrs. De Dietrich & Co., of Luneville, France. The trials are to commence in May.

### French Automobile Club's Motor-Cycle Race.

THE annual Coupe des Motocycles race, organized under the auspices of the French Automobile Club, is to be run off on May 14th. The distance is 100 kilometres, and the course, 50 kilometres out and back, from a point on the road between Orleans and Vierzon. The race is open to any motor-vehicle, weighing empty—that is to say, without riders or fuel—less than 440 lb. The prize is a challenge cup, which, however, only becomes the property of a competitor who wins the race two years in succession.

### The Benz Conversion.

SOME weeks ago it was reported that the business of Messrs. Benz & Co., of the Rheinischen Gasmotoren fabrik, Mannheim, the makers of the well-known motor-vehicles, was to have been converted into a joint-stock company. We now understand that the conversion has just been effected, the concern having been registered with a capital of £150,000.

### A Motor-Car Fire in Nice.

ACURIOUS accident happened lately at Nice, at the Continental Hotel. Quite suddenly, at one o'clock in the early morning, a terrible explosion woke up the whole of the inmates of the hotel, who were greatly terrified at the fierceness of the fire which they found raging in the courtyard. The explosion and subsequent conflagration were caused by an auto-car which was on fire owing to the imprudence of a waiter who was endeavouring to find a small dog which was supposed to have hidden itself in the carriage. He very unwisely conducted his search with the aid of a naked lighted candle. The explanation of the accident is that either the petrol tank or one of the pipes connecting it to the carburettor was leaking, with the result that the gaseous fumes became ignited from contact with the naked light. Unfortunately the car was ruined ere the flames were subdued, and the prime cause of the disaster—the dog—was killed.

**Whitsuntide Races.**

ARRANGEMENTS are in hand for the running off of two motor-car races during the local fêtes at Draguignan which take place at Whitsuntide. One race will be from Draguignan to Cannes and back, and will be restricted to racing vehicles. For heavier motor-cars, a race between Draguignan and Brignoles and back is being organized. *La Locomotion Automobile* states that efforts are also being made to obtain the use of a large building in which the competing vehicles may afterwards be placed on exhibition.

## MOTOR - TRICYCLE SPEED - REDUCING GEARS OR HILL-CLIMBING DEVICES.

ONE of the main drawbacks to the use of motor-tricycles is that the power of the motor has hitherto been transmitted to the rear axle of the machine at one fixed ratio of speed. Several inventors have endeavoured to devise a variable-speed gear for use on motor-tricycles, and one of the latest to come under our notice is that known as the Couget, which is being introduced by Messrs. M. G. Marais & Co., of 28 bis Rue Guersant, Paris. The object of the device is, of course, to obtain a further reduction of the speed of rotation of the rear axle of the machine without reducing that of the motor. In the Couget device this is effected by interposing between the pinion *F* on the motor-shaft and the spur wheel *A* on the axle of the tricycle a wheel

FIGS. 1 AND 2.—SHOWING ACTION OF CONTROL LEVER OF COUGET GEAR.

*D*, the diameter of which is four times greater than that of the pinion *F*. On the short shaft which carries the wheel *D* is also fitted a small pinion in gear with another small pinion *C*, which in turn gears with the wheel *A*. The pinion *F* is so mounted on the motor-shaft that it may be displaced through the medium of the connecting levers and handle *I J K*, within convenient reach of the rider, and made to gear with either the wheel *A* directly or with the wheel *D*, or it can also be placed in an intermediary position, so enabling the motor to be instantly cut off from the power-transmission mechanism. On level roads the usual position is adopted—that of pinion *F* on the motor-shaft gearing directly with the wheel *A*; up hill, the handle *J* is pulled over, thus bringing the pinion *F* into gear with *D*, and so reducing the speed of the tricycle without decreasing that of the motor. The gear runs in an

oil-containing chamber, provision being made for ample lubrication of the parts. The apparatus is stated to have been tested on some very steep hills in France, a  $1\frac{1}{4}$ -h.p. motor-tricycle, fitted with the device, with trailing carriage

FIG. 3.—DETAILS OF MECHANISM OF COUGET GEAR.

containing two persons, having traversed successfully the hilly road from La Corniche to Nice without it being necessary for the rider to pedal.

Another device having a similar object is that known as the Didier, which has lately been introduced by Messrs. Guyenet, Balvay & Roudier, of 73 Avenue de la Grande Armée, Paris, and of which an illustration is given in Fig. 4. The gear is carried in a frame attached to the side of the

FIG. 4.—THE DIDIER GEAR.

motor. The crank-shaft of the motor is made rather longer than usual, and carries two pinions, both of which run loose on the shaft. One of the pinions gears directly with the large spur wheel on the axle of the tricycle, while the right-hand one gears with an intermediate spur wheel mounted on a short spindle, which in turns gears with another toothed wheel keyed rigidly on one end of an upper shaft. At the opposite end of the latter is a small-toothed wheel gearing directly with the large spur wheel on the tricycle axle. It will be noticed from Fig. 4 that the two small pinions on the motor shaft have formed with them what may be termed the female portion of a finger clutch, each having four slots into which fit cor-

responding projections on the male portion of the clutch. The latter is arranged between the two pinions in such a way that while it rotates with the motor shaft it is free to be moved either to the left or right along it, this movement being controlled by the series of levers seen in the illustration, which are connected with a small handle attached to the frame of the tricycle in front of the rider. Pulling this handle over in one direction brings the clutch into gear with the left-hand pinion, the machine being then driven at the normal speed of the motor; up hill the handle is pushed over in the opposite direction, bringing the clutch into gear with the right-hand pinion, and so reducing the speed of the machine without decreasing that of the motor. The handle, and con-

FIG. 5.—THE DELBRUCK GEAR.

sequently the clutch, may also be placed in a central position, thus enabling the motor to be entirely and instantly cut off from the power transmission mechanism. One of the principal claims made for the Didier variable-speed gear is that all the spur-wheels are always in gear with each other and revolving, so enabling the change from a high to a low speed to be made without stopping the motor, and without any fear of damaging the teeth of the wheels. The illustration (Fig. 4) shows the gear uncovered, but in practice it is enclosed in an oil-containing case. The Didier gear has, we understand, been tried by and received the approval of M. Bouton, of Messrs. De Dion & Bouton, the makers of the well-known motor-tricycle.

Fig. 5 gives a general view of another speed-reducing gear for motor-tricycles which has recently been put on the market by M. Georges Delbruck, of 7 Rue Garnier, Nice. The gear, as will be seen from the illustration, is enclosed in an oil-containing case. Unfortunately, we have been unable to obtain a drawing of the gear with the cover removed, but we learn that it consists of a series of spur wheels. It is controlled by a small handle fixed on the frame in front of the rider. With the handle pulled over in one direction the normal speed of the motor is transferred to the tricycle, while with the handle pushed over in the opposite direction the tricycle is only driven at half the speed of the motor, the latter being entirely cut off from the transmission mechanism when the handle is in a central position. One of the drawbacks to the Delbruck gear, which weighs  $7\frac{3}{4}$  lb., is that it is necessary to almost bring the motor to a standstill before changing from one speed to the other.

THE much "bepuffed" American Compressed Air Auto-Truck Company have announced their intention of running a line of omnibuses in Fifth Avenue, New York.

## A NEW VOITURETTE: THE "UNION."

CONSTRUCTORS in France, as well as those in England, are at last recognising to the full the public demand for a light, cheap, two-seated motor-car. The French makers have recognised the demand for some time, but instead of striving to reproduce a carriage in miniature, have endeavoured to make the public put up with more or less unsatisfactory adaptations of the tricycle or quadricycle body with additional seats for the convenience (?) of riders.

Makers do not seem to understand that the public do not really desire this class of vehicle: they will take it in some cases, owing to the inability to obtain better designed vehicles, but there are still a large number of people who will rather go without the desired motor-voiturette than put up with the crude transformations offered them at present. The whole character and meaning of the word "voiturette" seems to have been deliberately overlooked, both in France and in England, and manufacturers have been content to pervert its meaning by advertising their productions by this term. "Voiturette" means simply "a little carriage," it certainly does not mean a two or three-seated tricycle, nor does it mean a trailing car that can be attached to a tricycle. Some French makers have designed vehicles which conform to the term used, such as the Elan, Decauville, and some other concerns, but in England no such endeavour has been made, so far as practical cars are concerned.

Amongst the latest productions partaking of the voiturette character is that illustrated herewith, but this still leaves much to be desired. The vehicle is known as the "Union" voiturette in France, and is certainly not the worst of many similar productions. It is, to French people at least, "elegant" in form, and possesses the further advantage of being light in weight.

The frame is constructed of steel tubing, and is carried on two pairs of wheels. The motor employed is of the De Dion type, developing  $1\frac{3}{4}$  h.p., and is mounted at the back and gears with the rear road-wheel axle similarly as is the case with the De Dion tricycle. Two different speeds are, however, available, a "demultiplicateur" or reducing gear being provided; and the motor, moreover, can be thrown out

of action by a release of the friction clutch. The ignition of the gaseous charges is effected by an electric spark, the current for producing this being controlled by a switch placed on the handle-bar of the steering apparatus. The vehicle is also provided with a hand lever, as shown in the illustration, which is utilised for starting the motor. The advancing of the ignition and the control of the air supply, and consequently the carburetting device, is obtained by means of two small levers placed on the front of the seat beneath the driver.

In practice we have found the "Union" voiturette to work very satisfactorily indeed, but its average speed is, of course, not very high, especially on hilly roads. The main objection to this voiturette arises from the fact that the motor employed is not really sufficiently powerful to give the range of speeds so generally desired by those requiring this type of vehicle.

## SCOTTISH NOTES.

### The Weather and Dress.

THE cold March winds to which we have been treated this week have naturally kept many motor-car enthusiasts from their favourite long-distance driving. It has been cold enough for out-of-door locomotion of any sort, but the speed-travelling obtainable on a motor-car is, at low temperature such as we have been experiencing, enjoyable only to those who are specially protected from cold in clothing approximating that of the Esquimaux, or the leather costumes adopted by many French automobilists. So far as Scotland is concerned nothing in the way of a specially-designed costume has been adopted by motor-carists. For cold weather such as obtains in early spring as well as autumn and winter, clothing of a particularly warm character is absolutely necessary—something different to anything we have yet been accustomed to. Before the advent of the motor-car we never thought of road driving for 50 to 100 miles at a time, consequently no provision was necessary beyond a warm driving coat and gloves. It is quite different now, and some advance in costume-making for motor-carists is urgently required.

### A New Stirling-Daimler Car.

I HAD an opportunity this week of a ride of some 25 miles on one of the latest cars turned out by Stirling's Motor Carriages, Ltd., of Hamilton. The car, which is fitted with a 5½-h.p. Daimler motor, has been purchased by an Edinburgh gentleman, and I must say is the most elegant and fleetest looking car I have yet seen. The body is of the type known as the "dog cart," but its lines have to be seen to be appreciated. The front or driving seat is built up in wood framing, and has finely curved panels. Its upholstery in fine blue cloth is of the most luxurious description, and the occupant experiences the comfortable sense of sitting in the most heavily upholstered easy arm-chair. The form of the hind seat is simpler, with rectangular lines which contrast well with the circular lines of the front. The body panels curve gently outward, and are relieved with well-proportioned louvres. The body is painted in dark blue, with wheels and undercarriage of exquisite ivory white, and lined out in two shades of blue. It is furnished with handsome brass-mounted lamps and fitted with elegantly curved patent leather mudwings, giving the whole vehicle a distinct and graceful character. In aristocratic Edinburgh it is certain to be much admired, and will do much to remove the prejudice of many good people who objected to the designs of some of the earlier vehicles. The run was of the most pleasant description. The ease with which the car could be manipulated under the varying conditions of road and traffic was remarkable, and I dismounted from the carriage after my 25 miles

"spin" feeling that it only required a run of that distance on a really first-class motor-car to convert the most obstinate opponent of the mechanical carriage.

### The Scotch Police and Motor-Cars.

IN my wanderings in various parts of England and over a considerable portion of the land of the "mountain and the flood," I have had occasion to remark on the attitude of the police authorities in both divisions of the kingdom with regard to the new vehicles. I have invariably found the Scottish police well-disposed to the motor-car, and in several instances I believe they have been able to render valuable assistance to autocarists. A case which came under my notice recently illustrates this: A motor-car party were returning from a trip one evening last week some miles south of Glasgow when they encountered a stretch of newly-laid road metal extending about 150 yards and across the whole width of the roadway. To have driven through it would have seriously damaged the rubber tires, to say nothing of the wheel rims, and to avoid it one course only was open—that of riding on the footpath. This was the course adopted, and although a bold representative of the law was present he, metaphorically speaking, "looked the other way." I do not know the law in the matter of road-making and road obstruction, but I imagine that the county council who are responsible for this antiquated method of road-repair could be held responsible for damage to vehicles compelled to pass over roads in this condition.

### The Benz in Scotland.

THESE little cars, so popular on the Continent, are now obtainable in Aberdeen, Harper's Motor Company of that city being the sole agents for Scotland. I understand specimens of these cars are at present being exhibited in Edinburgh and Glasgow, and as soon as their merits are demonstrated on our Scottish roads the agency should become of considerable importance.

### Dundee Enterprise.

TO the enterprise of the Dundee and District Tramway Co., Ltd., is due in no small measure the popularity of the motor-car in the north-east of Scotland. As early as February of last year the directors of this concern, who, in addition to their tramway system, possess a large coach-hiring business, visited all the motor-car manufactories in the kingdom. The last place visited, curiously enough, was the Hamilton factory of Messrs. Stirling, where they found exactly the type of motor-car they were in search of, and an order was placed shortly afterwards. The success of this car led to orders for two more being placed with the same firm, and throughout the summer they have been in great demand. Another mark of this Company's confidence in the motor-car may be found in the fact that the Hamilton firm have a steam omnibus at present being built for them. The vehicle is to seat eighteen persons, and will be propelled by a Leyland motor, which was so successful in the official trials at Liverpool and Birmingham last year.

### The Mors Challenge.

I HAVE heard many regrets expressed in view of the probability of this contest falling through, the letter of the Automobile Association, Limited, which appeared in last week's issue of *The Motor-Car Journal* being generally read to mean that quibbles would be raised which in the end would effectually obstruct the progress of arrangements. It is regarded as quite ridiculous on the part of the Mors people to suggest to race a 125-guineas Pennington car with a small single motor advertised as speeded no higher

than 18 miles per hour against their Mors with double cylinder motor at more than three times the price (380 guineas), and described as speeded to over 30 miles per hour. A two-cylinder "Mors" against a two-cylinder "Pennington" is considered here to offer a fair and reasonable contest, and it is hoped an effort will be made to bring off the event.

#### Motor-Cars for Bathgate.

I AM informed that premises have been acquired in Bathgate, Glasgow, for the purpose of establishing the motor-hiring business. The enterprise, I believe, is a private one, and considering the populous nature of the district it should prove remunerative. There is, no doubt, a great opening for such ventures in large districts as well as in holiday resorts, and the progress of the Bathgate establishment will be watched with interest.

#### The Pennington at Edinburgh.

THE practical demonstrations of the capabilities of the new Pennington cars which I had the opportunity of witnessing during the Edinburgh show last month have left a very pleasing impression on minds which had previously been somewhat sceptical. There is perhaps no better city or district in Scotland in which a motor-vehicle can be more completely tested. For speed on the level the Queensferry Road offers every facility, and for hill-climbing our "modern Athens" presents a dozen gradients ranging from 1 in 4 to 1 in 12, some of them long and difficult. It was when the Pennington car was seen to skip up such hills with apparent ease that faith was born in the sceptical and fresh confidence in those who were believers. I understand that within the next week or so several of the new Pennington-Stirling cars will be put on the road, and so soon as I have had an opportunity of a trial of one of them I will report fully the results thereof.

#### The Scottish Club.

I HAVE been requested to invite all who are interested in the proposed Motor-Car Club of Scotland to send their names to Messrs. Mitchell and Smith, C.A., 59 St. Vincent Street, Glasgow, who have, I am informed, agreed to act as *pro tem.* honorary secretaries, in order that a date may be arranged convenient to all on which to call a preliminary meeting. It should, of course, be understood that the club will not be confined to owners of motor-vehicles, but will be open to all who are in any way interested in, or desire to become connected with, the motor-car movement. I need hardly say that it will expedite matters considerably if names are forwarded promptly.

BROWN HEATHER.

TART, a motor cyclist, has beaten the world's record for motor-tricycles from 1 to 47 kilometres at the rate of 39 1-3rd miles per hour.

FRANK MORRIS, of London Road, King's Lynn, has been appointed sole agent for Norfolk for the Daimler Company's motor-cars. He also holds an agency for the Benz carriages and Beeston motor-tricycles.

A COMPANY has just been formed in Paris (22 Rue Laferrière, with the title La Société de Voitures Automobiles de Petite Livraison—Lemue & Lantry) to manufacture and introduce a new type of light motor parcels delivery van.

THE first public motor-cycle race will take place at the Crystal Palace on Easter Monday. The first event is one hour's race between C. G. Wridgway and a Parisian "Chauffeur," M. Rigal. The riders will be started from opposite sides of the track, and each will have a time-keeper, so that records can be accurately kept. Chase and Palmer will subsequently ride a race paced by motor-cycles.

## THE PLANTEAU PETROLEUM-SPIRIT MOTOR.

AMONGST the many attempts to produce a perfectly-balanced impulse engine, one of the latest to come under our notice is that illustrated in Figs. 1 and 2, showing respectively a part-sectional front elevation and a transverse section of the petroleum-spirit motor invented by M. J. Planteau, of Bolbec (Seine-Inférieure, France). From the illustrations it will be noticed that the cylinder *C* is made rather longer than usual to contain two pistons *D* and *D'*, the explosion taking place between the two pistons and forcing them outward at the same time. The piston *D* is directly connected to the crank *v* on the crank shaft *A*, while on the other hand the piston *D'* is provided with a short piston-rod which terminates at its upper end in a cross-head *F*. At each end of the latter are attached sliding rods *tt'*, which, extending along the sides of the cylinder, pass through holes in the crank casing *B*, the lower ends of these sliding rods being connected together by a short shaft *o*. Two pairs of sliding pieces *T* are arranged within the casing *B*, between which the shaft is kept in a perfect vertical up-and-down movement by means of sliding bearings. On the shaft *o*, between the two sliding pieces *T*, is arranged a connecting rod *d'*, which works on a second crank *v'* on the crank-shaft set at an angle of 180 deg. to *v*, the

FIG. 1.

FIG. 2.

two connecting rods being, it is claimed, in this way equally balanced at every point of the stroke. The valves are contained in a special chamber *C* at the front of and cast in one piece with the cylinder. The admission valve *S* works automatically—that is to say, it is opened by the aspiration stroke of the motor. The exhaust valve *s* is opened by means of a little pivoted piece *i*, which is lifted at every second revolution of the motor-shaft by the cam *O*. The latter is carried on a sleeve *I* on an intermediary shaft *a* driven off, and at half the speed of, the motor shaft, through the gear-wheels *E e*. The motor is provided with a governor which controls the sleeve *I*; when the speed becomes excessive the latter is caused to slide to the right, carrying with it the cam *O*, the exhaust valve being thus kept closed until the speed has again assumed the normal. The ignition is arranged to be effected as desired, either by an incandescent tube or electrically. The cranks and connecting rods work in an oil-containing chamber *B*, which is built up of two halves, so that the working parts may be readily accessible in case of necessity. M. Planteau claims that by the arrangement he has adopted he has succeeded in not only obtaining a perfectly-balanced engine, but also an equality in the direction and intensity of the strains, in this way overcoming vibration. The motor, which has a water-jacketed cylinder, normally runs at a speed of 500 revolutions per minute.

## Motor-Cars in Holland.

DAIMLER (CANNSTATT) *Vis-à-Vis* CAR. EXHIBITED BY HERREN WILLEM REMMERS & CO.

THE EXHIBITS AT THE CYCLE AND MOTOR-CAR EXHIBITION IN AMSTERDAM.

EVER since the visit of the members of the French Automobile Club to Holland last year, an increasing amount of attention has been paid in that country to the automobile movement, and if proof of this fact were needed it is to be found in the large display of motor-vehicles which is at present being made in connection with the Cycle and Motor-Car Exhibition which was opened in the Paleis voor Volkslijdt in Amsterdam on the 16th inst., and which closes on Sunday next, the 26th inst. Although the exhibition contains nothing very new to those who keep in close touch with the motor-car movement, the bulk of the vehicles displayed being of foreign construction, yet the show is attracting considerable attention on the part of Dutch *chauffeurs* who have taken advantage of the opportunities the exhibition has afforded of comparing the products of motor-car builders in England, France, and Germany.

Mr. Willem Gerth, of Trans II., Utrecht, exhibits a four-seated 4-h.p. victoria, constructed by M. H. Vallée, of Le Mans, France. It is unnecessary to deal at length with the Vallée car, its details being already fairly well known in this country. Mr. Gerst also exhibits a light three-seated carriage of French construction known as the "Dumond." The vehicle is fitted with a 3-h.p. petroleum-spirit motor. The ignition is electrical, while the cylinder is provided with a water-circulating jacket. The weight of this little car is stated to be just over 3 cwt. A De Dion motor-tricycle and a "Dumond" motor-quadracycle, fitted with a 2-h.p. motor, to seat two persons, are also exhibited at this stand.

The De Hinde Rijwielen Machinefabriek (Van Gink, Ott Bultmann & Co.), Amsterdam, show the parts of a new light motor-vehicle they are constructing. The car, which will seat four persons, *char-a-banc* fashion, has a frame built up of steel tubes, and is provided with two petroleum-spirit motors of 2½-h.p. each, which are so arranged that only one, or both, the motors can be employed as desired. The motors, which are located in the rear portion of the vehicle, are fitted with electrical ignition and with radial discs to the cylinders for cooling purposes.

Messrs. Willem Remmers & Co., of Amsterdam, the agents for Holland and the Colonies for the Daimler Motoren

Gesellschaft, of Cannstatt, Wurtemberg, have on view a couple of vehicles constructed by this company—a four-seated 4-h.p. *vis-à-vis* (which is illustrated in Fig. 1) and a 1½-ton 4-h.p. motor-lorry, which call for no special description at this time, a similar remark applying to the exhibit of Mr. W. J. Stokvis, of Arnhem, the Dutch agent for the Daimler Motor Co., Ltd., of London and Coventry, which comprises three vehicles constructed by this company—a Rougemont wagonette, a Wyley phaeton, and a delivery van.

Mr. B. J. Rubens of Amsterdam, who represents in Holland Messrs. De Dietrich & Co., of Lunéville, France, exhibits a 6½-h.p. motor-wagon built on the Amédée Bollée system. The vehicle is built on similar lines to the one which took part in the French Automobile Club's *poids-lourds* trials last year.

La Société des Voitures des Etablissements Decauville Ainé, of 11 Boulevard Malesherbes, Paris, shows through its Dutch agent, Mr. H. J. Van Ewijk, of Amsterdam, four of its well-known type of light two-seated motor-carriages.

Mr. B. A. Jansen, of 379 & 380 Zuid-Willemsvaart C., Hertogenbosch, exhibits a 5-h.p. petroleum motor-carriage constructed by Messrs. Cambier & Co., of St. Maurice, Lille; a small 2-seated 3-h.p. carriage by the Anglo-French Co., and a couple of motor-tricycles.

Other exhibitors of motor-cars are the Groninger Motor Rijtuigen Exploitatie, of Groningen, and the Simplex Rijwielabriek, of Amsterdam. In addition, several firms show motor-bicycles and tricycles, among which may be mentioned the "Wilhelmina" Rijwielabriek, of Zeist; Messrs. Gebr. Willink, Amsterdam (Werner motor-bicycles); the Gruno Rijwielabriek, of Winschoten; Messrs. Hugo Smit & Son, of Arnhem (Beeston motor-tricycles and quadracycles); the Erste Nederl Rijwielabriek (Burgers), of Deventer, and Mr. J. Leonard Lang, of Amsterdam.

Although the display of motor-vehicles at the Dutch show is only a relatively small one, yet it is sufficient to prove that the automobile movement has already got a firm footing in the Netherlands. Several of the Dutch cycle-making concerns are known to be looking into the question of motor-vehicles and cycles, and it is fully anticipated that a year hence motor-cars will make a bigger showing at the exhibition than has been the case this year.

## A New Type of Motor Vehicle.

**A** MOTOR-VEHICLE for heavy traction entirely new to this country is being introduced by Mr. Charles T. Crowden, of the Motor Works, Leamington. It is designed more especially to act as a tractor, although possessing load space in itself, and its purpose is the hauling of heavy loads, such as furniture vans, etc. In appearance the tractor is somewhat like a tramcar, but its body is articulated in the centre, and the wheels and axles are mounted on springs and fitted with horn plates similar to an ordinary railway or tramway vehicle, but instead of running on the road they run inside large iron rings which virtually form road wheels. Inside each road-ring is bent and secured a rail of light section in which the main axle wheels are constructed to run. The wheels are driven by a suitable motor and gearing, with change-gear apparatus fitted in the body of the vehicle, and both pairs of axles are driven so that the tractor drives with all four wheels through the road-rings (without racks and pinions or cogs) without any of the difficulties hitherto experienced with traction engines.

The road rail-rings are steadied in the following manner:—Across the centre of each are two guide rollers, about 10 in. diameter, of a similar section to the driving wheels. These rollers are carried on a suitable frame on the body of the car, and pivoted over the centre of each axle and road-ring. The rollers are extended by two strong spiral springs concealed in the roller frame. When the waggon is in motion, if one or any of the road rail-rings comes in contact with an obstacle, instead of being lifted suddenly and almost vertically over it, as would be the case with an ordinary wheel, the road-ring is slightly arrested whilst the car is still moving onward, the resistance being taken by the guide rollers and spiral springs until the power of the springs acting on the ring lifts it over as gently as though no obstacle existed, very much in the same way as a boat riding over a wave. All four road wheels are drivers, and also steerers, and the control of the vehicle can be effected from either of its ends, both platforms being provided with the necessary levers controlling the gear.

Mr. Crowden has conducted trials with one of these vehicles at Horstell, Westphalia. This was fitted with a 20 b.h.p. oil engine, having axle or driving wheels 2 ft. 2 in. diameter, and road rail-rings 7 ft. 6 in. diameter and 6½ in. wide. The guide rollers, extended by the springs to keep the road-rings in position, were about 10 in. diameter. There were two driving gears with friction clutches, first speed 2½ miles and the second 4½ miles per hour, motion being conveyed to each axle by means of a driving chain, and there being a lever on each platform to operate the clutches, to interchange

gears, and to act upon the four road-rings for steering purposes. The tractor was provided with water tanks, condensers, and oil tanks for running a day with one oil tank supply. The total weight in working order about six tons.

The following are the results of the experiments:—1st. Blocks of wood 4 in. high were placed at intervals on the macadam road, and the vehicle ran over them at the high speed with perfect ease, the engine running light with very little vibration, and the governor cutting out every six revolutions. 2nd. In the second experiment the tractor was attached to thirteen brick trucks 19 ft. 5 in. long, 6 ft. 4 in. wide, 4 ft. 8 in. high; hind wheels 3 ft. 9 in. diameter, front wheels 3 ft. 6 in. diameter. Each truck carried 1,000 bricks; weight of bricks 42.9 tons, and trucks 13 tons; total, 55.9 tons. The road was soft macadam. The tractor drew this load with the slow speed developing about one-third of its full power or 6.3 h.p., and blocks of wood were thrown in front of it and also in front of individual trucks, with the result that the truck wheels were

skidded, and ploughed up the surface of the road without, however, stopping the progress of the train, the tractor passing easily over the obstacles. The high speed was also applied during this test with satisfactory results. Next, the last two trucks had their hind wheels skidded by means of screw brakes, and the engine then developed full power. In no instance did the driving wheels of the tractor skid in the road rail-rings, nor did the latter skid on the wet macadam. In the third experiment the tractor was man-

œuvred over some soft sandy loamy soil, into which she sank 9 in., with the result that the chain and chain-driving wheels were in the ground; but she pulled herself out of this without the wheels slipping in the road-rings. The petroleum consumed with a full load is 1¼ gallons per hour, or 7 pints per brake h.p. per hour.

The hauling power of the tractor when fitted with road rail-rings having been ascertained by dynamometer tests, the road rail-rings were removed as a final test, and it was found that the provision of the road rail-rings increased the hauling capacity of the tractor by over 60 per cent. Mr. Crowden regards these tests as conclusive, and holds the opinion that the provision of the road rail-rings will minimise many difficulties previously encountered in driving motor-vehicles over uneven surfaces, and will at the same time reduce the customary cutting-up of soft road surfaces where heavy loads are hauled over them.

An Italian motorist has covered 59 kilometres in the hour.

## A DIARY OF MECHANICAL ROAD LOCOMOTION IN ENGLAND.

WE append herewith a concise diary of the progress of road locomotion in England. The dates, wherever possible, have been carefully verified, and may, we think, be depended upon. It will doubtless prove useful to our readers, the information being given in the most condensed form possible.

### DIARY.

- 1610—Drawing vehicles by mechanical means the subject of Ramsay and Wildgosse's patent.
- 1763—Cugnot exhibited the model of a carriage to be drawn without horses in Paris.
- 1769—First public trial of Cugnot's steam carriage.
- 1784—Murdock's model of a tractor for drawing wagons exhibited at Redruth.
- Symington invented a road motor-carriage.
- 1786—Sadler's experiments in motor road locomotion stopped by Watt.
- 1788—Fourness and Ashworth took out a patent for an engine for driving "travelling carriages of every denomination."
- 1789—Thomas Allen, of London, said to have invented a steam road carriage.
- 1790—Nathan Read took out a patent in America for a steam road carriage, in which a rack-and-ratchet motion was introduced.
- 1800—R. Trevithick commenced to make his first road locomotive in November.
- 1802—In March of this year Trevithick and Vivian obtained a patent for a high pressure steam engine for propelling carriages on common roads.
- 1804—Oliver Evans constructed a steam carriage at Philadelphia.
- 1808—John Dumbell patented a tractor for driving carriages and waggons on roads.
- 1813—W. Brunton, of Pentrich, took out a patent for his "mechanical traveller."
- 1814—Thomas Tindall, of Scarborough, patented a steam engine for driving carriages.
- 1816—A patent for a steam tractor for ordinary roads granted to Joseph Reynolds.
- 1821—A steam carriage was patented by Julius Griffiths, of Brompton.
- In August of this year David Gordon took out a patent for improvements in steam carriages.
- 1823—Samuel Brown patented a tractor for ordinary roads.
- A patent for a steam boiler, intended for use with steam carriages, was taken out by James Neville.
- In September a horseless carriage was invented by a Somersetshire carpenter.
- W. H. James took out a patent for a tubular boiler for motor vehicles.
- 1824—Patent granted to T. Burstall, of Edinburgh, and J. Hill, of London, for an engine for vehicles propelled on ordinary roads.
- Hancock invented his first steam engine for road locomotion.
- In May W. H. James took out a patent for his steam carriage.
- 1825—Gurney patented his first steam carriage in May, and his second in October.
- J. and S. Seaward patented a method of propelling vehicles on roads.
- T. W. Parker, of Illinois, patented his steam engine for road vehicles.
- Matthew Broemark, of Copenhagen, invented a steam carriage for roads.
- Burstall's steam carriage introduced.

- Hancock's steam engine for road carriages was patented.
- 1826—Burstall and Hill took out patents for improvements in steam carriages.
- F. Andrews invented the "Pilot" steering wheel for steam carriages.
- 1827—James Neville patented a road tractor.
- Mr. Whitelaw brought out a steam carriage.
- Dr. Harland, of Scarborough, took out a patent for a steam phaeton.
- A patent taken out by T. S. Holland for "producing a locomotive action for steam carriages on roads."
- 1828—J. Nasmyth constructed a steam carriage.
- Gurney's improved steam carriage patented.
- 1829—Col. J. Viney patented a boiler for steam road carriages.
- 1830—Rowe and Boase, of Albany Street, London, patented some improvements in steam carriages.
- Mr. Clive took out a patent for improvements in motor vehicles for ordinary roads.
- W. G. and R. Heaton, of Birmingham, took out patents for steam carriages.
- Steam coach constructed by Messrs. Shields and Son, at Cincinnati.
- Lea, of Hoxton, constructed a model of a new steam carriage.
- 1831—Sir Charles Dance ran Gurney's steam coach between Gloucester and Cheltenham, relinquishing the service in June.
- Summer and Ogle constructed a steam carriage that obtained a greater speed than any predecessor.
- Steam locomotive for use on roads patented by Messrs. Napier.
- 1832—Improvements in steam carriages effected by Dr. Church; in June a company was formed at Birmingham to place Dr. Church's steam carriages upon the road.
- In October Mr. Redmund patented a boiler for steam carriages.
- 1833—In March Gibbs and Applegarth obtained a patent for improvements in steam carriages.
- Mr. Roberts, of Manchester, patented a locomotive carriage for common roads.
- A steam carriage ran for a short time between Norwich and Yarmouth; the invention of Mr. Watts, of the former city.
- The London and Paddington Steam Carriage Co. formed to run Hancock's steam coaches.
- 1833—In July Maceroni and Squire patented their multi-tubular boiler for steam carriages.
- 1834—Mr. J. Scott Russell established a regular line of steam coaches between Paisley and Glasgow.
- Yates and Smith introduced a new steam carriage.
- Mr. Richard Witty, of Hanley, obtained a patent in connection with steam carriages.
- 1836—Sir J. Anderson introduced a boiler specially intended for steam carriages.
- A Bill ostensibly to repel the prohibitory tolls on steam carriages was introduced into the House of Commons. On reaching the Lords, it was referred to a Select Committee, which declared against the Bill.
- 1837—An Act was passed, the result of which was to discourage further experiments in the construction of steam carriages for roads.
- 1837—T. Hills, of Deptford, brought out a road tractor with compensating gear.
- 1856—Messrs. Garrett and Son, of Leiston, introduced a self-moving road locomotive with chain gear.
- 1858—Mr. Rickett, of Stoney Stratford, supplied pleasure carriages propelled by steam to the Earl of Caithness and the Marquis of Stafford.

(To be concluded.)

## CORRESPONDENCE.

## SHALL THE N.C.U. CONTROL MOTOR-CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the interest at present being taken in the new rule, or rather addition to one of their old rules, that the N.C.U. recently passed, which is so broad that one cannot tell what class of motor-riding they wish to control, I have written to them as per enclosed copy letters and have received the enclosed unsatisfactory reply.

It seems to me a great pity, with the season fast approaching when a few motor competitions would possibly liven things up and help to draw the public gate at the cycle meetings, that the Union should commence to legislate for something which is essentially outside their province, that is, a pastime or sport which is distinct from an athletic sport, and in which the muscles of the competitor are not the chief factor, as in cycling, as it is obvious that the rules that go to govern all athletic sports are not applicable when one comes to deal with sailing yachts, driving coaches, playing billiards, driving motors, or in fact anything on this basis, which, so far, athletic bodies have not attempted to legislate for, feeling rightly they were outside their proper scope.

Yours truly,

London, March 15th, 1899.

S. F. EDGE.

MR. S. F. EDGE TO N.C.U.

February 9th, 1899.

The Secretary,  
National Cyclists Union,  
27M Chancery Lane, W.C.

DEAR SIR,—I notice that at your meeting held at Southampton last week you have passed a rule to control cycles fitted with a motor which reads as follows:—Clause F., Rule 103.—“Any cycle driven wholly or partially by any other power than that of the rider.”

The point that is not quite clear to my mind is, When does a motor-car become a cycle driven wholly or partially by any other power than that of the rider, as it seems to me that one might unwittingly infringe your rule unless that point is made clear.

For example, I have and use what is known as a motor-tricycle, which is a tricycle pure and simple to which a motor is attached, and which, if the motor was taken off, could be used as an ordinary tricycle, but if I did away with the pedals and chains as is sometimes the case with this type, I then have a three-wheel vehicle which it is absolutely impossible to use as a cycle, it being purely a mechanically-propelled vehicle.

Then I have another type also with three wheels, but which the manufacturer makes no provision for assistance by the rider either by feet or hand, but one or two ingenious users have and are able to adapt an arrangement whereby it can be assisted by the force of the user with either feet or hands.

It seems to me that unless this point is made clear many auto-carists may not work in harmony with you through their reading the rule one way and the N.C.U. reading it another.

Yours truly,

(Signed) S. F. EDGE.

N.C.U. TO MR. S. F. EDGE.

National Cyclists Union,  
27 Chancery Lane, London, W.C.,

February 13th, 1899.

S. F. Edge, Esq.,  
7M Tavistock Chambers,  
Hart Street, W.C.

DEAR SIR,—The rule as passed by the Council at their recent meeting reads as follows:—

“The following cycles are eligible for cycle races held under the Union rules. In every case it is understood that an artificial motor be used, but the whole motive force be that of the rider except in cases coming under Clause F.

“(F). For motor races.—Any cycle driven wholly or partially by any other power than that of the rider.”

I am directed by my Committee to say that any machine that comes within this definition will be regarded as under N.C.U. rules.

Yours truly,

(Signed) SAM. R. NOBLE,  
Secretary.

MR. S. F. EDGE TO N.C.U.

S. R. Noble, Esq.,

February 14th, 1899.

National Cyclists Union.

DEAR SIR,—I thank you for your letter of the 13th, but am afraid it does not help me very much, as the difficulty that I find is to know what is meant in your rule by a “cycle,” and that is what I wished your Committee to tell me, and thought I asked for quite plainly in my previous letter; in fact, I even went further than that, and gave them various examples of motor-vehicles which very easily could be made to appear on one or the other side of the line which divides motor-cycles proper from motor-vehicles that are not cycles as I understand them; and it was to get a definite ruling on this point that I wrote you so fully.

However, with a view not to trouble you any further, I thought I would look at Nuttall's '98 edition and see what they had to say on the matter; but under the word “Cycle” their definition is as follows, which does not meet the case at all:—

“Cycle—A series of years, events or phenomena which recur in the same order; a long period; an imaginary circle in the heavens; a body of legend connected with some mythical subject; *v.m.*, to revolve in a circle.”

From there I went to the word “Velocipede,” and that gives a definition as follows:—

“Velocipede—A sort of hand-carriage with two wheels, one before the other, connected by a beam on which the person sits astride and propels the vehicle by a treadle on the axis of the main wheel.”

This is a very much better definition, and seems to me to meet the case if we construe a “cycle” as meaning a vehicle that can be propelled either wholly or partly by means of the muscular force or weight of the rider.

Perhaps with this information before your Committee they may be able to give me a direct answer.

Apologising for troubling you,

Yours truly,

(Signed) S. F. EDGE.

## MR. WRIDGWAY AND THE SPEED OF HIS MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a letter from Mr. Wridgway in your issue of March 10th, would he be so kind as to say what tricycle he uses on which he has often done thirty-three miles in an hour?

I have never heard of a tricycle doing this speed except in France on the track, and would like very much to know where one like Mr. Wridgway's can be purchased, how much, and if the makers will really guarantee this rate.

If it is the one I saw him riding at the Sheen House meet I should be very pleased to see Mr. Wridgway do this publicly, as I am quite certain the tricycle he then rode, but on which he did not finish first in the races in question, was not capable of covering anything like thirty-three miles in an hour, even if it was at all possible to do that rate for one mile only on a prepared track.

Yours truly,

London, S.W.

H. G. NORRIS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I must thank both Dr. Lehweß and “Cynicus” for giving me a chance to clear up a few points which probably were not very clear to them before. First of all, I will deal with the letter from Dr. Lehweß. I have only to call the attention of Dr. Lehweß to the fact that I was waiting for him at the top of a certain hill at the end of the “impromptu race,” and he will remember distinctly that I waited for him several times to put him on the right road, he being a total stranger in the district. I got clear away from the Mors car several times, and only stopped for those reasons which I am now giving. The second Mors car turned up about two minutes after Dr. Lehweß's car. Moreover, the Liverpool competition must still be fresh in the memory of Dr. Lehweß—more especially the return journey, when I was obliged to leave the Mors car (to which I had been “hanging on” for shelter from the terrific gale), as he was going absolutely too slow for my engine to keep going. Naturally he will infer that I had to pedal; that is so, but my tricycle has not a

change gear, and, moreover, I had not the same means of lightening the weight on my tricycle as that method adopted by Dr. Lehweß by permitting his assistant to run alongside the car to allow his engine to get up speed. From the place where I left Dr. Lehweß to St. George's Hall, Liverpool, a distance of about ten miles, I gained no less than a quarter of an hour upon him.

I shall be extremely pleased indeed, providing I can spare the time from business, to arrange a match with the Mors car; and, it is needless to say, nothing would give me greater pleasure than to be present at the interesting match, which I sincerely trust will take place, between Messrs. Pennington & Baines and the Automobile Association, and no doubt there are several more enthusiastic autocarists who would be only too willing to assist in any way.

Now, in regard to "Cynicus." He is quite right when he states that I finished last in the race at Sheen House, but "Cynicus" has evidently forgotten that I asked the starter if my fellow-competitors objected to delaying the start until I had temporarily repaired my induction coil, which was very badly damaged in coming over from Paris two days before the race. The repair which I did was very quickly done, and the vibration soon undid the small repair which I had made, and naturally I only obtained an occasional spark, thereby not getting full results.

"Cynicus" doubts that I can do even one mile at the rate of thirty miles per hour; first, I will refer him to the speed claims set forth by the Automobile Association for the Mors; secondly, to Dr. Lehweß's letter of last week, in which he wants us to believe that I admitted that neither of us could leave the other, thereby admitting that my tricycle was even as fast as the Mors—and everyone knows the speed they claim for these cars; thirdly, to the impromptu race itself, which was over a distance of sixteen and one-quarter miles, which was covered in forty-one minutes, over very rough roads, very hilly, full of turnings, besides having to slow up in going through a village. This works out at something like twenty-four miles per hour, and was accomplished on a winter's day; this time includes all the stoppages which I made to put Dr. Lehweß on the right road, whereas my thirty-three miles were done on absolutely straight roads in the north of France. Naturally, "Cynicus," with his experience, is fully cognisant of the fact that a tricycle on the track is much slower than on the road, owing to the fact that upon entering the banking the machine is tilted and the carburation affected, owing to the fact that the petrol is higher on one side of the carburettor than the other, thereby touching the float on one side and not allowing a free passage for the mixture which is already in the carburettor.

I fail to see why "Cynicus" signs under a *nom de plume*, and if he will forward me his name and address I shall have great pleasure in arranging a speed trial, and, no doubt, Messrs. Pennington & Baines will be only too pleased to arrange a seat for him upon their racing car to enable him to check the times for himself.

Yours faithfully,

C. G. WRIDGWAY.

Chorlton-cum-Hardy, Manchester.

March 18th, 1899.

## DEALERS IN MOTOR-CAR SPIRIT.

THE following is a brief list of the dealers in a few principal towns who stock Pratt's motor-car spirit, and are able to supply same on demand. When running on an organized route, it is better to forward a post-card to these firms stating the quantity required and the day upon which a call will be made. For the convenience of country readers journeying to London five London dealers are given:—

| LONDON.                             |   |
|-------------------------------------|---|
| Civil Service Co-operative Society, | Haymarket, S.W.                             |
| Civil Service Supply Association,   | Queen Victoria Street, E.C.                 |
| Automobile Association, Ltd.,       | 1 Prince's Road, Holland Park.              |
| C. W. Austin,                       | 35 Brewer Street, Soho.                     |
| Motor Manufacturing Company, Ltd.,  | 47 Holborn Viaduct, E.C.                    |
| Beverley,                           | J. W. Tanfield.                             |
| Birchington-on-Sea,                 | E. Bushbridge, Stores, The Green.           |
| Bournemouth,                        | Birmingham Cycle Co., 5 Holdenhurst Road.   |
| Bradford,                           | Mrs. Calvert.                               |
| Bridlington,                        | C. Smith.                                   |
| Gainsborough,                       | Heinle & Co., 50 and 168 Trinity Street.    |
| Great Yarmouth,                     | J. Leach, Market Place.                     |
| Hull,                               | King & Co., Ltd.                            |
| Leeds,                              | G. Exley & Sons.                            |
| Barnard Castle,                     | Joshua Burn & Son, Horse Market.            |
| Middlesbro',                        | Constantine Pickering & Co.                 |
| Newcastle-on-Tyne,                  | Rowland Barnett & Co., 41 Dean Street.      |
| Thirsk,                             | Clark & Co., Market Place.                  |
| "                                   | Ayre & Son.                                 |
| Edinburgh,                          | Finlayson & Stewart, Regent Arch.           |
| Leith,                              | Graham Yool & Co.                           |
| "                                   | A. M. Reid, Commercial Street.              |
| Edinburgh,                          | Auto-Car Co., London Road.                  |
| Coventry,                           | Daimler Motor Co., Motor Mills.             |
| "                                   | Motor Manufacturing Co., Ltd., Motor Mills. |
| Tonbridge,                          | H. Wightwick & Son.                         |
| Winchester,                         | H. W. Frampton Exors., Jewry Street.        |
| Slough,                             | F. Parker, cycle agent.                     |
| Reading,                            | Speedwell Motor-Car Co., Oxford Street.     |
| "                                   | J. H. Fuller, 22 Minster Street.            |
| Norwich,                            | Geo. Base, Pitt Street.                     |
| St. Albans,                         | C. A. Sharpe, Bernard Street.               |
| Newport Pagnell,                    | F. W. Taylor, chemist.                      |
| Olney,                              | A. Timperley, grocer.                       |
| Faringdon, Berks,                   | G. E. Liddiard.                             |
| Ipswich,                            | Grimwade, Ridley & Co.                      |
| Salisbury,                          | Hardy & Son, chemists.                      |

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### Public Motor-Car Services.

AGAIN we have to record advances in the direction of providing motor-vehicles for conveying passengers between different stations in the Provinces. Southport is one of the latest converts to motor road locomotion, and we understand that a preliminary service is to commence there at Easter with a view to extended service ultimately. Manchester is another convert, where a service will run between Manchester and Cheetham, and another between Manchester and Cheadle. Liverpool is also waking up in this direction, and although no services are proposed at present in Liverpool proper, yet others are being formulated for different districts on the Cheshire side of the Mersey. We hear of projects in the West too, where several towns are coquetting with motor-vehicles for public service. The Sunderland project is well under way. The Dover syndicate has received an excess of applications for shares, as briefly recorded in our last issue. The suggested Canterbury and Herne Bay service is progressing favourably. The Brighton and district service is enlisting the sympathies of the "local magnates," and the Hastings project is making satisfactory headway. The Bedford and Kempston service has two cars in course of construction, and the Cambridge syndicate has now been firmly formed, and has ordered three vehicles; whilst the Isle of Man syndicate is also well on the way towards starting its service.

### The London Electric Cabs.

VERY considerable misunderstanding appears to exist in the public mind as to the reasons directing the London Electric Cab Company in calling in temporarily their electric cabs from the London streets. In addition several serious mis-statements have been made in the daily newspapers in regard to the action of the Company in this matter, and also in regard to its financial position and prospects. As we stated in our first issue, the directors considered it advisable to call in the whole of the cabs then plying for hire, in order that they might be overhauled, and fitted, amongst other things with stronger springs, which are calculated to afford increased comfort to the passengers. Of course, it might be argued that a few cabs might have been withdrawn at a time, but the directors in their wisdom thought that other circumstances warranted the whole being withdrawn at one period, so that all might be overhauled and replaced in the streets in a perfect and uniform state with the 50 additional new cabs also in progress of being completed. They were further urged to take this course from the fact that some structural alterations were desirable at the dépôt, and these it appears could not have been carried out with convenience whilst the entries to the premises were constantly in use by the incoming and outgoing cabs. In regard to the financial position of the Company, we are assured most positively by the chairman that the whole of the debentures which the directors thought it necessary to issue have been fully taken up; and it may be mentioned that amongst the largest

subscribers to this issue are the directors themselves, who have taken up considerably more than one-half the total issue. The needed necessary capital being thus secured, and the vehicles now being brought up to date as dictated by experience, it may be anticipated that success will attend the operations of the Company. As we have before stated, the cabs are now run at a profit, although the profit is not a very large one; but as the potential power of the Company's new charging station is approached more nearly, so, as a matter of course, the business will be more profitable and remunerative. It follows that if the station affords without strain on a full load sufficient current to run 80 or 100 cabs per day, it will be more profitable than restricting its output to the needs of 30 cabs, as what may be termed "establishment expenses" are practically the same for the greater as for the lesser number, and the profits are increased by the revenue from 50 or 70 additional vehicles.

### Boston, U.S.A., and Motor-Vehicles.

WE briefly recorded in a previous issue the fact that the municipal authorities of Boston, U.S.A. had restricted the entry of motor-vehicles into the Public Parks excepting during the "unholy" hours between 9 p.m. and 10.30 a.m., the entry during the day being refused entirely. Colonel Pope, of the Pope Manufacturing Company, the well-known builders of the "Columbia" electric-carriage, is reported to have said in reference to this decree, that he cannot see by "what right the park commissioners can exclude motor-vehicles." He is reported to have continued as follows: "I absolutely and unqualifiedly deny the legal or moral right of anyone to restrict me as to my vehicle, providing that I exercise due care and do no injury; but I trust that in Boston, of all places, I shall not be obliged to make a fight which I surely shall win, but which will take my time and money." "I will see the park commissioners," concluded Colonel Pope, "and try first to find out what they mean by this order. If the motor-carriages must stay out, so must all others, and baby carriages and bicycles. How would the people like that? Yet there is no difference, in law or in fact, between them. However, I do not anticipate any such trouble; I won't believe, until they tell me so, that the park commissioners of my own city seriously intend to show themselves more opposed to progress than in any other community in the United States or Europe." It appears that the Boston authorities, in issuing the decree, have also issued an order to the following effect: "No person shall run or operate a motor-vehicle of any kind on the public parks or boulevards until he shall have been examined and certified as competent by the inspector of the Park Department, and a permit issued on such certificate, nor until such vehicle shall have been inspected and a certificate of approval issued by the inspector of the Park Department, and a licence for the operation or use of such vehicle has been granted." Neither Colonel Pope nor any other reasonable being objects to such an order, provided that the "inspector of the Park Department" is qualified to carry out his duties in determining whether or not a person is capable of controlling a vehicle or the vehicle is capable of being controlled. In reference to

the decrees, it is only right to mention that the chairman of Park Commissioners has announced that the order is not a permanent one. He holds that pedestrians and users of hippomobiles ought first to have a chance of becoming acquainted with motor-vehicles before meeting them in the Parks, but on being met with the rejoinder that their appearance in the Parks would contribute to this end, made reply that "they had the whole world and the public streets of Boston in which to make the public acquainted with them." Those who know the Boston streets will appreciate the irony of this concession.

**Wanted:  
A "Voiturette."**

AGAIN and again the public have called loudly for a "voiturette" or light carriage whose motor must not necessarily be started by pedals, and whose power is sufficient to negotiate ordinary inclines without the fortuitous aid of the rider's muscles. The demand is equally as great in France as in England, but so far nothing really successful has been placed on the market except the Bollée voiturette, and this has been discredited in both France and England because some "know-all" thought it wise to place an exhaust valve on top instead of underneath the motor! Indeed, to such an extent has this discredit proceeded that we hear the only makers of this type of vehicle in England have decided to cease its manufacture. A correspondent whose letter appears in another column of this issue simply voices the demand of at least thousands of others in France and in England. There are, of course, two sides to this question of demand: one is the matter of price, and the other the matter of possibility of manufacture at the price. Now a motor-tricycle is fairly listed at 70 guineas, and in a few cases at a trifle less. Would it not be possible to build that tricycle with an attachment permitting the motor to be thrown out of gear with the road-wheels at the same price or thereabouts? There is no doubt that this can be done. But would it meet public demands? In some few instances it might; and to meet other desires we can see no reason why a new frame should not be adopted which would permit the use of a seat, rather than the uncomfortable saddle, with its lack of support to the rider. But on the whole this adapted vehicle is hardly what is wanted by the majority of the public. As a resident in Paris said to us the other day, every manufacturer in France, and every selling agent also, is inundated with enquiries for a motor-voiturette, seating two side by side, capable of mounting fair hills, and travelling comfortably on ordinary roads, with the average speed of ten miles per hour, and costing about £100 to £140. English manufacturers and agents know also that similar demands have been made upon them. Why has that demand not been satisfied in either country? Simply for the reason that no constructor has been bold enough to maintain that a motor of 3 h.p. (which would be the minimum power required for the purpose) and of the requisitely light type can be successfully driven without the aid of water to cool the cylinder walls and explosion chambers. This arises from two facts well recognised by engineers: First, to obtain the necessary lightness with sufficient power it is necessary that the impulses of the engine shall be much more frequent than would be necessary with a larger and heavier engine of the same power. As a consequence the explosions are increased to such a degree that the excessive heat thus generated is impossible to be removed from the cylinder walls and the explosion chamber by means of the circulation of air, even when the most scientifically designed *ailettes*, or cooling fins, at present known, are adopted. Secondly, there arises another difficulty. Those who have most closely examined the problems connected with very high-speed impulse engines have recognised the fact that the expansive or rather explosive forces of the fired gases have a limit, and if the speed of the piston is such that it exceeds the "speed of explosion" so to say, the force of the piston actually outpaces the explosive force and by the impulsive energy stored in the fly-wheel thus "out-

runs the constable," and receives only a portion of the impulsive energy of the exploded gases. As a consequence these two facts have rendered it imperative that the high speed, light weight motor should be discarded in favour of a slower piston speed combined with a longer piston stroke and a greater piston diameter. Directly this course is adopted there follows as a concomitant the necessity of providing cooling water with the also necessary tanks, circulating pipes and pumps. Thus weight is increased, expense grows, and more complications of mechanical parts ensue. We do not, however, desire to state that it will not ultimately be possible to cool motors of 3 or 4 h.p. by the air of cooling fins alone, but at the present moment no thoroughly satisfactory solution has been arrived at in a practical sense. De Dion & Bouton, the pioneers—indeed, the leaders—in the inventing of a light high-speed motor cooled by air, have recognised that at present the problem is beyond them, and, as recorded in our last issue, have adopted a small circulation of water, with the addition of a condenser or radiator for cooling the circulating water. If this firm have recognised the present impracticability of air-cooling for 3 and 4-h.p. engines it is time also that we recognised the fact, and, whilst not neglecting the search for a means of overcoming this present impossibility, should in the meantime produce such a vehicle as is demanded, fitted with water-cooling devices.

**Furious Driving:  
Police versus Public  
Evidence.**

MR. ALFRED RAWLINSON, of Winwick Warren, near Rugby, who was described by his solicitor as "one of the best motor-car drivers in Europe," figured as defendant at Wolverhampton Borough Police Court on Saturday to a summons for furiously driving a motor-car. A constable told the magistrates that the car darted down one street like a flash of lightning, and nearly ran over two ladies and a child, and that he tried to run after it, but could get nowhere near it, a statement that caused considerable laughter. Three other witnesses gave somewhat similar evidence, one adding that it seemed to him as if the driver had lost all control of the car. For the defence it was contended that the car was travelling at not more than five miles an hour, the defendant saying he could have stopped the car in the space of its own length. A stud groom, employed by the defendant, said he was on horseback "jogging" slowly down the street when the car passed him at "a snail's pace." Other witnesses corroborated this statement, and the magistrates dismissed the case. Fortunately for Mr. Rawlinson, the Wolverhampton magistrates were not quite so biased in favour of police evidence as is frequently the case in other courts. In another part of this issue we record the hearing of a summons in which the contrary was the case, and in spite of the evidence of unbiassed witnesses a conviction resulted. We congratulate Mr. Rawlinson on his escape and the magistrates on their fairness.

**Motor-Cars  
for Private  
Hirings.**

IN another portion of the present issue we allude to the successful work and the extensions at present going on and projected by the Edinburgh Auto-car Company in regard to providing the public with motor-vehicle services on set routes. This Company, however, do not restrict their work to this class of service only, as, besides being also selling agents for the Motor Manufacturing Co., Ltd., they further keep vehicles for private hiring purposes. In regard to the profitable character of this section of the business, Mr. Love, the manager of the Company, has said in a recent interview that he has never had difficulty in finding customers to hire these vehicles. He informs us that he has let every car in his possession for the Easter holidays, and he had applications for over two dozen additional cars for this period. He rents them to hirers by the day, week or month.

His experiences proved the correctness of our contentions in previous issues of this Journal—viz., that jobmasters and others would find it extremely remunerative to have one or two of these vehicles for letting out on hire. The only necessity is a small repairing shop, such as is generally found in most jobmasters' establishments, and without this we would not recommend anyone to embark in such a venture.

#### The London Steam Omnibus Company.

WE hear that the London Steam Omnibus Company are proceeding quietly with their work, and have also managed to satisfy some of the malcontents who desired to have their allotments cancelled and their money

returned. Motors are being constructed at the Canstatt works of the Daimler Motoren Gesellschaft, and will shortly be ready for delivery in this country for attachment to vehicle bodies. So far as we can learn, however, no progress has been made in providing steam omnibuses, the Company preferring, according to our information, to work at present with petroleum-spirit motors. We trust we may be able to chronicle additional advances towards fulfilling the destinies of the Company in putting motor-omnibuses on the roads shortly.

#### Police Evidence on Furious Driving.

THE report in other columns of this issue in regard to the proceedings against one motor-tricyclist, two riders of ordinary safety bicycles, and one rider of an ordinary tricycle, afford ample opportunity for demonstrating that in some circles the magistrates accept the nonsensical evidence of a police constable against the assertions of independent witnesses and mechanical facts. In this case it was alleged that the four defendants approached the constable at a "furious" pace—at least eighteen miles an hour, according to his assertion. He called on them to stop, and they immediately complied, and on his complaining of the pace being nearly twenty miles an hour, they denied the impeachment. During the argument, or statement of knowledge and skill against police guesswork, a stranger and independent witness arrived on the scene, and having seen the reputed furious riding interposed the remark that in his opinion the four accused persons were not only going at a pace well within a fourteen-mile limit, but that the construction and gearing of the motor-tricycle would quite prevent the rider from proceeding at any such pace as that alleged by the constable. This statement was repeated by Dr. O'Reilly on oath, but notwithstanding the fact that it was a physical impossibility to ride the ordinary tricycle at the speed alleged, the motorcyclist with his three companions was convicted and fined ten shillings.

#### Legislation for Motor-Cars in the U.S.A.

As was to be anticipated the Legislative authorities of the United States are to be asked to pass a Bill having for its objects the regulation of the speed of travel of motor-cars and the licensing of all drivers of horseless vehicles. France was previously the happy hunting-ground of those motor-car enthusiasts who desired to risk their lives by travelling on public roads at the greatest rate of speed possible by the employment of motors ridiculously out of proportion; but now, and to the regret of many of these mad enthusiasts, the Legislature has stepped in and formulated rules, as intimated in a previous issue of this Journal. As the citizens of the United States became bitten with automobilism, so some of them have been endeavouring to surpass the paces of the fast "trotters" previously employed by the "four-hundred" in their hippomobiles. As a result the Legislature is invited to step in to control the movements of the cars, which opponents of automobilism naturally, of course, describe erratic. The *New York Times*, in commenting on the intro-

duction of the Bill in the House of Assembly, states that it has been drawn up by persons in New York City who regard the reckless operation of the new motor-vehicles as offering a serious menace to life and limb, and it will be presented at their request. This is a pity, for it would have been far better for the automobilists of New York to have recognised the fact that some regulations would have been necessary and to have formulated some reasonable terms which would not have proved unduly restrictive to the pleasures of users of horseless vehicles, whilst at the same time being sufficiently stringent to protect the somewhat acute susceptibilities of their opponents.

#### Another Improperly Broken Horse.

THE following letter, culled from the columns of the *Western Morning News*, under the title of "Motor-Car," is interesting as showing that, whilst a motor-car driver is compelled by stringent laws to have his vehicle under proper control, the driver of a hippomobile expects, even when his horse is improperly broken (as is proved by his own showing), that motor-vehicles should be inconvenienced by his neglect. The letter is as follows:—

Sir,—I should be greatly obliged if someone would inform me if there is any law which compels the drivers of small motor-cars to stop when passing a horse. I met one of these cars with, I believe, two mining students of Camborne a few days ago. My horse was afraid of it and I had trouble with her, but the driver did not attempt to stop. My horse will pass the traction engine when it stops very well. The driver of the traction always stops at once if I put up my whip. If there is no law in force to make these motor-cars stop when requested, I think the County Council should at once pass a bye-law to that effect. These cars are most dangerous to horses, and I fear there will be a serious accident if some restraint is not put upon them.

Of course, every reasonable driver of a motor-car will at once stop his vehicle if desired to do so, and in accordance with the law governing motor-vehicles. We are afraid, however, that a motor-vehicle at rest, but with the motor running, is oftentimes more likely to contribute to a horse's fright than would be the case if it moved swiftly past out of the horse's vision.

#### Electric "Charging" Posts on the Continent.

ONE of our Continental correspondents in a recent issue contributed an item in regard to the forthcoming establishment of "charging" posts or pillars on the main roads of Belgium and France whereat in return for certain coins drivers of electrically-propelled vehicles, or those who use electric ignition devices, could re-charge their exhausted batteries. It was asserted that these "posts" would be established at fairly close intervals on the main roads, and, in addition to providing accommodation for charging batteries, would also comprise shops for effecting mechanical repairs, together with a restaurant, café, and refreshment bar. We recorded the opinion at the time that the scheme was much too grandiose for fulfilment, and our suspicions have been verified by the Paris correspondent of a financial daily contemporary. Speaking of another suspicious scheme, and the reputed connection therewith of Mr. Tankerville Chamberlain, "a gentleman not unknown in City circles," the correspondent continues: "This gentleman is, I believe, also connected with a concern known as La Poste Electrique . . . which is anxious to build relays on the highways of Europe for electric motor-cars which do not exist, and are not likely to exist for some years to come . . . La Poste Electrique is a Belgian Company, but has recently taken sumptuous offices in Paris, and though the Company is only six months old it is already issuing to the public 10,000,000 francs' worth of debentures. As an instance of sheer audacity I doubt if this can be equalled, for the Company (which is a creation of the celebrated M. de Verragaude, or Brémont, of "Credit" notoriety) has neither land nor property of any kind upon which debentures can be legally issued. A good many men will probably recall the generous footmen, the multitude of hangers-on, and the princely offices on the Place Vendôme

over which De Verragaude presided in state a few years back. La Poste Electrique, his latest creation, is well worthy of a man of keen intelligence and unbounded audacity in the art of extracting money from the public." We cordially agree with the Paris Correspondent of the *Financial Times*.

#### A Reported Motor-Cab Collision.

It was reported in the daily newspapers of the 24th inst. that shortly before ten o'clock on the previous day a serious collision between a motor-cab and a hansom occurred in Mile End Road, E., and was attended with serious injuries to three persons. According to these reports the guiding wheel of the motor was out of order, with the result that the vehicle dashed into a hansom cab and overturned it. The driver of the hansom, named Johnson, and the occupants of the vehicle, James Chapman and his wife, who reside in Aldgate, were injured, and had to be removed to the hospital. The report also records the fact that the driver of the motor was thrown from his seat, but escaped with slight injuries. In reference to this report we are desired by the chairman and managing director of the London Electrical Cab Company to state that the "motor-cab" alluded to was not one of the Company's vehicles, as none were out on hire that day. The only other licensed cab we know is that belonging to the British Motor Syndicate, and generally used by Mr. H. J. Lawson personally. We are also assured that this was not the vehicle in fault, so must conclude that "motor-cab" in the original report means "motor-car," and that it belonged to a private owner, whom we regret to say we have been unable to trace.

#### The Gender of Automobiles.

It has been solemnly decided in France that all automobiles are of the masculine gender, and henceforth it will be both unfashionable and ungrammatical to refer to the horseless vehicle in any other way. There appears to have been a misogynistic minority in favour of bestowing the feminine appellation upon automobiles. And these misogynists, as they thought, succeeded in establishing an unanswerable case in favour of the feminine appellation, but one of them had suffered in a motor-car accident, and the grammarians would have none of his evidence. They determined to give judgment in strict conformity with the requirements of French pedagogy, and they viewed the problem so seriously that they went out of their way to rebuke the jesting note-writers in the French press.

#### Public Motor-Vehicles in Chicago.

THE Chicagoans are the latest residents in the United States cities to desire a service of motor-vehicles for the conveyance of the public between fixed stages in the vicinity of their city. In this connection it is interesting to note the procedure which a group of capitalists have followed in order to secure a monopoly in this class of traffic. It appears that they grouped themselves into a syndicate with a nominal capital of a million sterling and then petitioned the South Park Commissioners of Chicago to grant them a permit to run a line of motor-vehicles through the Michigan Avenue and South Park thoroughfares, and agreed that, if an exclusive privilege were granted them for carrying passengers by this service, they would hand over to the Commissioners, for addition to public revenue, a sum equal to 10 per cent. of the net earnings of the vehicles. From press reports it would appear that the syndicate have the unqualified support of property owners and residents along the route, who have presented a petition in favour of the project. The Commissioners, however, are doubtful if their powers permit them to grant the required licence. Consequently, for the moment at least, the scheme is "hung up," although the projectors hope to convince the Commissioners that they possess the

necessary powers to grant the required exclusive licence. In connection with this scheme, it is interesting to note the comments of an United States technical journal, the *Electrical Review*. Our contemporary states that "if the project can be carried through, the *cabs* to be used (the italics are ours) will be of magnificent design and have a seating capacity of thirty persons"! In this country we should hardly term a vehicle carrying thirty passengers a "cab." No mention is made of the motive power to be employed in driving these "cabs," and we are rather curious as to how a vehicle carrying thirty passengers is to be propelled in view of the further fact that we are assured by our technical contemporary that "during the summer, observatory coaches would be used with seats on top"!

#### A Motor Maxim Gun for Cyclists' Corps.

It is announced that the 26th Middlesex (Cyclists' Corps) are about to experiment with a new gun-carriage at Aldershot, as they are taking down with them to-day (Thursday) a motor-tricycle with a service pattern Maxim gun attached. Quick movement being essential, the gun can be instantly unlimbered, and pulled or carried into position, the weight of gun and carriage being only some 140 lb. To ease the work of transport the wheels have pneumatic tires, and, of course, are mounted on ball bearings. A team of eight men and cycles will accompany the gun, each man carrying a box on his back wheel containing 250 rounds of ammunition, besides his regulation bandolier. In case of breakdown on the part of the motor, by an ingenious arrangement four cycles can be coupled together and attached to the pole of the gun carriage. We know that Mr. Fredk. R. Simms has been hard at work designing some such vehicle, but on appeal to him we find that the Cyclists' Corps' "motor-gun" was not of his invention. Further enquiries have elicited the fact that the "new gun-carriage" consists of an ordinary motor-tricycle, with De Dion motor, having connected to it at the back a special form of trailer, on which the Maxim gun is mounted. We also learn that the combination is due to Mr. Charter, of the Cyclometer Co., of Kirby Street, Hatton Garden, E.C., and Sergeant Rule, and that it will be used by the latter's regiment in the forthcoming Easter manœuvres.

#### The Utility of Motor-Vehicles.

EVERY ONE who takes even a remote interest in motor-vehicles is willing to allow that their share of utility in various circumstances is great; we doubt, however, whether the veriest enthusiast has, in his wildest dreams, ever imagined that this sphere is so great as a recent circumstance has proved it to be. Recently, according to press reports, a woman met with an accident at Murray Hill, N.Y., U.S.A., with the result that one arm was severely fractured. A surgeon on being called in found the fracture so complicated that to discover the exact location and extent of the injury it would be necessary to use the Röntgen rays. Instruments were at once brought, and all was ready for the operation, when it was suddenly found that no electric current was available. Fortunately, so runs the tale, an electrical cab was within hail and this was drawn up to the door, the batteries connected up to the coil by means of conductors, and the examination took place. Truly a wonderful example of American utilisation of horseless vehicles!

#### Popularising the Motor-Vehicle in America.

ONE of the most reliable of our American electrical contemporaries, the *Electrical Engineer* (which, by the way, has recently been incorporated with the *Electrical World*), had the following in a recent issue: "Somewhere in one of his essays or books, Mr. Herbert Spencer remarks that the best way to introduce wooden shoes would be to have the fashionable women of society wear them first. Then the

habit would quickly permeate downward, and sabots would be all the rage. There is the shrewdness of the cynic not less than the philosophy of the sociologist in this observation. It is a fortunate thing for electric vehicles that at the present moment the ownership of an automobile is one of the signs of being 'in the swim,' and the process of popularization and vulgarization has begun at the right end, viewed from the Spencerian standpoint. That 'tout Paris' had gone an-automobilizing we knew, but it appears to be the fashion among the royalties of Europe to indulge in exercise in the horseless carriage. Example and precedent are everything in setting a new fashion, and it is pertinent to inquire how far electrical people have gone to foster the automobile art by actual patronage. We know of but one president of a local lighting company who has an automobile, yet it would seem obvious that many such dignitaries might by setting the fashion in their own cities stimulate greatly the consumption of 'juice.' We know of but one electrical supply or manufacturing company that handles its materials with an automobile delivery waggon. There may be others, but they are doubtless extremely few and far between. Yet here surely is the chance by example and positive demonstration to help along the speedy coming of the new industry from which electricity is to derive an enormous development. Electrical journals may push these things on public attention; but the stimulus needed is the example of the whole electrical fraternity itself going in for automobiles. In the meantime, the manufacturers of these vehicles do not bemoan any lack of orders." The sermon addressed to those interested in the American electrical industries might well be tendered to British firms similarly interested. Indeed, we think that British firms, as a whole, deserve the strictures even more strongly than do the American houses. We may state that to our contemporary's credit, it has never lost an opportunity of advancing the interests of self-propelled locomotion. We would that we could say the same of some of our own leading technical journals.

#### The German Post Office and Motor-Vans.

THE report of the German Postmaster-General in regard to the use of motor-vehicles for delivery of mails is not a comforting one to those who believe in mechanical road locomotion for such a purpose. The "Master of the Mails" reports that the trials of motor-vehicles for the purpose have not proved satisfactory, but that he is ready to adopt these vehicles if reliable vans can be obtained and the expense incurred is not greater than that of horse-drawn vehicles. It is strange if the German Postmaster-General should not have secured trials with reliable vehicles, in view of the fact that the works of the Daimler Motoren Gesellschaft are located in Canstatt, Westphalia, and that this factory has the credit of turning out the most reliable, if not the prettiest vehicles, in Europe. We do not remember at the time of writing who were the makers selected, but it is obvious from the official report that the performances of the vehicles were not very creditable.

#### Torquay and its Motor-Car Service.

WE alluded in a previous issue to an agitation which had been led by certain ultra-conservative residents of Torquay against the motor-car service inaugurated last autumn by the London Motor-Van and Wagon Company, Limited, whose cars run between the Strand and the Railway Station. The *Torquay Times* in a recent issue congratulated itself that the "complaints" of the residents in question have resulted in the temporary withdrawal of the cars from service. But as a matter of fact these complaints had but little to do with the withdrawal of the cars. They were in fact taken off the road for the reason that the service was not sufficiently large to warrant the establishment of local repair shops and

the employment of a resident manager who could exercise efficient control over the drivers. That this control was necessary is proved by the fact that the receipts for two cars when a manager was not present did not amount to those of one car when a manager was present. Later in the season the service will be renewed by the London Motor-Van and Wagon Company, Limited, and an additional service started to Paignton, but care will be taken to ensure that efficient control of the men will give the Torquay residents freedom from any but "fancy" causes of complaint.

#### The "Contour" Road Book.

A RELIABLE guide to the gradients of roads and the slopes of hills is a positive necessity to the motor-carist, and in the compilation of his "Contour" Road Book Mr. Harry R. G. Inglis has placed automobilists under an obligation. The volumes dealing with Scotland and the North of England have been at the public service for some time; that concerning the south-eastern division has recently been published, and by next summer the fourth volume will have been completed. Having availed ourselves of the information in connection with some of the 400 routes indicated in the south-eastern division, we would congratulate Mr. Inglis on having upheld his reputation as a painstaking and accurate compiler. Personal knowledge has been requisitioned in preference to ancient records. With regard to route 525—from London to Peterborough—a printer's error sends us to Coventry instead of Baldock. Without desiring to appear hypercritical or in any way qualifying our good opinion of the book as a whole, some reference should be made to the signs on the diagrams. They are frequently so small as to need the most scrutinising observation. Mr. Inglis has modestly noted, in his introduction, that the explanations of these signs appear on page 243—as if that was the only place in which such explanations can be found. We have been glad, however, to find them on several other pages, and wish they had been repeated on every page where the diagrams are given. The letterpress concerning each route is concise and lucid; there are several good maps, and the volume has been issued by Messrs. Gall and Inglis in a neat size, with rounded corners, which contribute to its convenience as a pocket companion.

#### Further Extension of Motor-Car Services.

THE motor-wagonette public service inaugurated by Mr. John Love, of the Edinburgh Auto-Car Company, on the Queen's birthday last year, has proved so successful that it has been decided to extend it very considerably. To this end two more cars have been purchased from the Motor Manufacturing Company, Ltd., one of char-a-banc type and one a wagonette, the former seating nine and the latter eight. Additional extensions are also promised in the future, as Mr. Love anticipates the summer demand will be such that several additional cars will have to be put upon the road. At present the cars run from Prince's Street to Newington and Haymarket, and in the summer months and at holiday times additional vehicles run to Portobello and the Forth Bridge. Mr. Love finds that his experiment has been successful, and holds the opinion that it would have been much more so had he had more cars at his command. At the present time he contends that he could find passengers enough to keep a dozen cars running between Prince's Street and the Haymarket alone, whereas no more than two and sometimes three are so employed. As Mr. Love can obtain delivery of cars, so he intends to run them on Saturday to Peebles, North Berwick, Gullane, Banton, and Duddington, especially for the convenience of golfers and tourists. During the whole time that the cars have been running not one single accident has occurred, and this says much for Mr. Love's management and his insisting of periodical overhauling at frequent intervals in his works at Abbey Hill.

**Chain-Driving.**

A PAPER read at the second meeting of the Cycle Engineers' Institute at Birmingham on Saturday last by Mr. C. R. Garrard, M.I.M.E., dealt with this subject. The author first spoke of Mr. Hans Renold's system for compensating for the inevitable wear and elongation of chains, this, briefly stated, being effected by making the chain wheel of greater pitch than the chain, the system being equally applicable to both the block and the roller variety. It was his opinion that Mr. Renold's system would be carried still further; it was quite possible to calculate and produce different chains and different wheels, all of which would interchange and run well together—this, of course, within certain limits. Dealing with some objections which had been raised against the half-inch pitch, the author gave some figures, based on .160 as the size of the rivet, which showed that a sufficient thickness might be obtained for the other parts. The earlier half-inch roller chains had stretched abnormally, chiefly because the sleeves became loose in the side plates, this providing the most serious part of the whole problem. It remained for Prof. Sharp's testing machine to prove whether anything could be detected in the matter of efficiency between the three current pitches. The subject of resilience was next gone into at some length. The author had made carefully-planned experiments, the methods being explained by means of lantern views. Whether elasticity caused a loss of efficiency had been debated, and the balance of opinion was that within certain limits, owing to the perfect reaction, the observed resilience was a decided advantage. The author believed Mr. Staunton's "resilient" block chain to be superior to the ordinary block variety. The whole thing was a question of degree and reaction. The author had experimented to find how much pressure was required to spin out a roller. He found that, under conditions similar to those prevailing when the chain is working, it required 800 lb. pressure to make any impression; the roller tested was not hardened. In speaking of friction, the lecturer dealt with the friction of the rivets in the sleeves, chains *v.* bolts, motor-car chains, and anti-friction chains. Mr. F. W. Lanchester, to whose motor-car we referred in our last issue, gave some interesting facts referring to the chains of motor-cars, and the very high factor of safety considered necessary, explaining some of the reasons for this. Mr. P. M. Staunton then explained how this "resilient" chain reduced the disadvantage of the necessary intermittent drive of a cycle. He also drew attention to the difference in elasticity of form, and of substance, and elasticity through the multiplication of parts. A vote of thanks to the author for his paper brought the meeting to a close.

**The Bletchingley Disaster.**

In another column we give an account of the most regrettable accident that occurred to Major H. A. Barclay's car at Bletchingley last week; we are assured by Major Barclay that this account is correct in all details. This most unfortunate accident, luckily resulting in no serious injury to human beings, showed no primary fault in the construction of the car, although subsequent events would seem to demonstrate that means should be adopted to prevent the spirit from catching fire when the car is overturned, and so destroying the car and possibly further endangering the life or limbs of those who perhaps previously have been seriously injured. As to the causes leading up to the accident, there can be no dispute, we think, that these rested primarily in the unsuitability of the dress worn by Major Barclay on the occasion. A driver of a horse-drawn vehicle would be inconvenienced by a flapping hat-brim which obscured his vision at a critical moment, and even more so by his head being suddenly enveloped in the folds of a cape. The driver of a motor-vehicle would be even more so, as his hands are required for the proper manipulation of the vehicle, and he

would have, therefore, greater difficulty in freeing himself from the enveloping folds, the wind also retarding his efforts. As to the cause of the spirit catching fire, there is no doubt in our minds, and judging from the facts at our disposal, that, as a result of the collision and the turning of the car into the ditch, the connecting tube between the spirit tank and the carburettor became ruptured. Then, as the car overturned, the pressure in the tank projected the spirit directly on to the ignition lamps. Had the connection between the tank and the lamps been ruptured, the lamps would have ceased to burn, and probably no danger would have resulted. Major Barclay and his companion have our most sincere sympathy; the shock sustained by them must have been terrible; and we further congratulate them upon having emerged from the accident with such comparatively slight injuries.

**Bournemouth and its Motor-Car Service.**

ACCORDING to a provincial contemporary, during the latter half of last week, two questions appeared prominently in the street and club gossip of Bournemouth—"Have you been to the dog show?" and "Have you seen the motor-car?" The first subject is a matter of the past; the second is one which touches not only the past, but the present and the future in an even more important sense; for if there is one question more than another which is affecting the public mind of Bournemouth just now it is the question of street and road locomotion. Motor-cars are not altogether unknown in Bournemouth; from time to time vehicles propelled by electricity, oil, and steam have been seen in our streets for advertising purposes; and in some few instances medical and professional men have adopted one or other system for professional purposes. But in these latter cases the cars have been small and practically little more than tricycles or quadricycles; and it has been left to Mr. C. R. Hutchings to give Bournemouth people a really practical object-lesson as to the advantages or otherwise of the new system of vehicle on a larger scale. The question may be asked, "Who is Mr. Hutchings?" By profession Mr. Hutchings is a solicitor of long practice in Bournemouth; by choice he has given much of his spare time to the study of the science of locomotion. An ardent cyclist, and a mechanic of no small skill, he has tested time after time the various changes and improvements in road locomotion. His latest investigation has been in regard to mechanical road locomotion. As a member of the governing body having control of the Bournemouth roads, he has studied the question from the points of view of expending the ratepayer's money unprofitably, and also from that of providing the public with an efficient service of public vehicles which should give speed and ease without disfiguring the beauty of the town and its surroundings. He has found a solution, of course, in the motor-vehicle, and is supporting the forming of a service with that exceeding energy for which he is noted, and on which his great local influence rests. He has had a car supplied by the Motor Manufacturing Company, Limited, and has run this experimentally on one of the routes suggested, between Bournemouth and Canford Cliffs, besides taking longer and more extended trips in various directions. In reference to some of the advantages accruing from motor road locomotion as compared with horse-drawn vehicles, Mr. Hutchings has made some interesting and valuable calculations, which will do much to convince even the sceptical that salvation is to be found in the motor-vehicle.

AN automobile club has just been formed at Nancy, France.

THE Automobile Association desire us to state that the *Motor-Car Manual* is 1s. 6d. (post free 1s. 8d.), although the publishing price is 2s. 6d.

# The Serpollet Steam System for Motor-Vehicles.

FIG. 1.—ELEVATION OF WATER AND OIL FEED PUMP CONTROL.

FIGS. 2 AND 3.—DETAILS OF MOTOR.

FIGS. 4 AND 5.—PART SECTIONAL ELEVATION AND PLAN OF MOTOR.

**R**ECENT events in France have almost made it a necessity that we shall hear much more of the Serpollet steam carriage in the future than has been the case in the past. The company having the leading interest in the Serpollet patents has had too much to do in looking after the development of vehicles running on rails and using the Serpollet system to pay much attention to the—to them—smaller question of ordinary road vehicles. It is generally understood that this company has re-transferred its rights to Monsieur Serpollet, who has made arrangements with wealthy capitalists to finance him and to provide him with adequate means to manufacture. As a partial result of this development, at the end of last month Monsieur Serpollet, together with the holders of his English patents, demonstrated one of his most recent vehicles before a "select" company in London. The demonstration was successful in every way, and although the design of the carriage was not quite in accordance with English ideas, there was no difference of opinion as to the value of the improvements effected by Monsieur Serpollet, and the consequent thoroughly efficient manner in which it travelled under all conditions of traffic, roads, and loads. The principal of the improvements effected has been in control-

ling the supplies of both oil and water automatically and synchronously, so that on any additional amount of steam being required the additional water is accompanied by an extra supply of fuel to raise that steam. We are able to give some further information and also illustration (Fig. 1) of this interesting device. Referring to the illustration (Fig. 1), *B* is the petrol pump and *A* the water pump; their plunger pistons are controlled by short connecting rods, one pivoted to the lever *C* and one to a sliding piece on the lever *C*, which latter is itself pivoted to a rigid bar at the left; the distance between the pivots on the one hand and the sections of the pistons of the pumps *A* and *B* on the other are so calculated that the quantity of petrol pumped by the pump *B* is exactly that required to vaporise and superheat the water supplied by the pump *A*. Provision is made to adjust the device in order to rectify any disarrangement due to variations of the temperature, the quality of the petrol, etc. This is effected by means of the long screw *D*, which when turned carries with it the sliding piece *E*, and consequently the connecting rod of the pump *B*, the proportions originally established between the supply of oil and water being in this way maintained or modified as desired. When this adjustment has been made, it is still necessary to be able to vary the quan-

tities in proportion to the power the motor must develop, according to the nature of the road being traversed and to the speed. To provide for this the upper end of the lever *F*, which is connected to *C*, passes through a sliding piece *L*, free to slide between the two sides of the balanced or oscillating bar *M*. The latter is mounted at its centre on a crown on which it is free to oscillate, movement being given to the bar by means of an eccentric keyed on one of the shafts of the transmission gear. Thus, by means of the lever *P*, the driver can, from his seat, vary, by altering the position of the sliding piece *L*, the point at which the balanced bar *M* acts on the lever *F*, and consequently vary the stroke of the small connecting rods and of the two pumps. Another point worthy of mention is that by placing the petrol in the storage tank under a slight pressure, or by fixing the tank at a slightly greater height than the burners under the steam generator, the petrol flows slowly, while the vehicle is standing, and, without any action of the feed pumps, lifts the valves of the latter and passes to the burners just in sufficient quantity to give a very small flame, the generator being in this way always ready to get up steam at short notice.

Several views are given in Figs. 2 to 5 herewith of the new motor, which has lately been devised by M. Leon Serpollet, to work with superheated steam, as supplied by the special type of steam generator used in the Serpollet steam motor-vehicles. It comprises two single-acting cylinders *C C'* arranged opposite to each other in such a way that the two piston-rods work on to the same crank-shaft. The piston-rods *d* are pivoted to the bottom of the piston *D*, and are connected by a special crosshead to a single crank. The crank runs in an oil-containing chamber *B*, forming the frame of the motor, through the end of which projects the shaft. Steam is admitted behind the pistons by two valves *S S'*, symmetrically arranged on the top of the cylinders, the steam from the generator passing along by the small pipes *s s'*. A feature of the motor is the exhaust arrangement; orifices *O O'* are contrived in the cylinder walls near the end of the stroke of the piston, the excess of steam above atmospheric pressure passing away by these orifices as soon as communication is made between them and the space behind the pistons. The steam which remains in the cylinders at atmospheric pressure is not exhausted; it is, however, on the return stroke of the piston, compressed, and should the pressure due to the compression become greater than that of the steam in the boiler, it is forced back through the valve *S* into the pipe *s*. This arrangement, an alternative form of which is shown in Fig. 3, while not interfering with the admission of steam, is claimed to overcome all condensation within the cylinder and its consequent troubles. The method of controlling the two valves *S S'* is shown in Figs. 2, 4, and 5. It is effected by means of a small shaft *a* fixed directly above, and driven by gear-wheels *E* off and at the same speed as the motor-shaft. A cam sleeve *I* is mounted on this intermediary shaft *a* in such a way that it can slide along it longitudinally. The displacement of the sleeve is effected by means of a specially-shaped nut *n* mounted on a long screw *N* above the cam-shaft. This screw *N* is controlled by a handle *m*, which in turn is controlled by the centrifugal governor *P*. When the balls *p p'* of the governor rise or fall the ring *b* also rises or falls; this movement, by the intermediary of the lever arms *M*, causing the handle *m* and the screw *N* to turn slightly, and consequently to vary the position of the helical cam *I*, cast in one piece with the sleeve on the cam-shaft *a*. The result is that the rollers *o o'* on the ends of the admission valve rods receive a greater or less push from the cam, as the case may be; the admission of steam into the cylinder being in this way varied from, it is stated, zero to 80 per cent. A second cam *i* is provided for reversing the engine; to reverse, this cam is brought opposite to the rollers *o o'* by turning the handle *m*; in the motor-vehicles provision is made for doing this from the driver's seat. The consumption of steam is low; a two-cylindred motor (diameter of cylinders 80 m.m. and stroke 80 m.m.) developing at 510 revolutions per minute, 4 h.p. being said to consume 10 kilog. of steam per horse-power hour.

## MOTOR-CARS ON THE CONTINENT.

### An Italian Motor-Car Fete.

WE referred in a recent issue to the automobile fête at Verona, Italy. We now learn that the fête was a great success. The chief event was a race from Verona to Mantona and back, a distance of 180 miles. The race was divided into two groups—(1) motor-cycles, and (2) motor-carriages. In the first section there were eighteen starters, the winner being Signor Bugath, who covered the distance in 4 hours 5 min. In the second section nineteen vehicles put in an appearance at the start, the victor being Signor Agnelli, whose time for the 100 miles was 5 hours 3 min.

### Turning at High Speeds.

ANOTHER motor-car accident, fortunately without any serious result, is reported from France. It appears that M. Labouré, the Director of the Société de Voitures Automobiles "La Parisienne" of Paris, was out "motor-ing" with his wife, accompanied by a mechanic. At Fréjus a good deal of traffic was met with, and in taking a turn rather too quickly the vehicle overturned, throwing out the riders. Both M. and Mme. Labouré were taken to the hospital, where, however, their injuries were proved to be not very serious.

### Local Motor-Car Regulations in France.

THE Government regulations relating to motor-car traffic in France not yet having come into force, some of the local authorities are issuing regulations on their own account. Thus at Libourne a notice has been issued to the effect that no motor-vehicle may pass through the town at a greater speed than 6½ miles per hour, and that at night each vehicle must be provided with a lamp capable of lighting up the whole of the road for a distance of 65 feet in front of the car!

### Wheel-Steering Control.

IT is well known that among French *chauffeurs* there is an increasing partiality for controlling the steering gear by means of a wheel instead of by a lever. One of those who has long been a strong advocate of this system is M. Jeantaud, the well-known Parisian builder of electrical motor-vehicles. This gentleman has, we learn, lately devised an improved form of wheel-steering gear, which is under automatic control. We hope to publish details of the appliance in an early issue.

### The French Exhibition.

ALREADY ninety-five applications have been received for space at the forthcoming Motor-Car Exhibition in Paris under the auspices of the French Automobile Club, and as a result of the rapid way the space is being taken up the Exhibition authorities have demanded permission of the French Government to use a larger area of the Tuileries Gardens, the *locale* of the Exhibition, than last year.

### Public Motor-Vehicle Services on the Continent.

A SERVICE of motor-omnibuses is shortly to be started between Bouillon and Sedan, France. The vehicles, which according to the *Chauffeur* have been constructed by M. Malevez, of Namur, are fitted with 25-h.p. steam motors, the boiler being heated by means of liquid fuel. The maximum speed will be ten miles per hour.

**The Liège Cycle  
and  
Motor-Car Show.**

A CYCLE and motor-car show was opened at Liège, Belgium, on Saturday last, and remains open until Monday next, the 3rd April. The feature of the exhibition is the large display of motor-cycles and carriages, but as the exhibits in this section form practically a condensed replica of those shown at Brussels a fortnight ago, a description of which was given in our issue of the 17th inst., no lengthy report is necessary.

## A DIARY OF MECHANICAL ROAD LOCOMOTION IN ENGLAND.

### DIARY.—Concluded.

- 1860—Messrs. Louch and Messenger, of Swindon, built a successful steam carriage.
- 1861—Messrs. Carrett and Marshall constructed a steam carriage known as the "Fly-by-Night."
- 1862—Mr. Richard Tangye made a steam carriage.
- 1863—A self-moving steam carriage made by Mr. A. F. Yarrow.
- 1862—Aveling and Porter exhibited a self-moving steam carriage at the Great Exhibition.
- Mr. A. Patterson constructed a steam carriage.
- 1866—Mr. H. P. Holt brought out a "road steamer."
- 1867—Mr. J. W. Boulton's road tractor made a continuous journey of 90 miles.
- 1871—Garrett and Son brought out a self-moving traction engine.
- Self-contained steam omnibus introduced by Nairn.
- Messrs. Ransomes, Sims and Jefferies built four of Thomson's "road steamers" for the Indian Government.
- R. W. Thompson (who in 1845 had patented the pneumatic tire for wheels) introduced solid india-rubber tires which were applied to "road steamers."
- 1875—Mr. H. A. O. Mackenzie constructed his steam boiler for road locomotion.
- 1878—Mr. A. B. Blackburn made a mechanically-propelled dog-cart.
- 1870—Steam carriage made by Mr. Loftus Perkins.
- 1881—Mr. J. G. Inshaw made a steam car.
- 1888—Electric dog-cart made by Mr. Magnus Volk.

A BILL has been introduced into the Austrian Diet for the purposes of providing motor-car services in country districts in which the cost of constructing railways would be too great to prove remunerative.

ATTENTION is to be devoted to automobilism at the meeting of the French Association for the Advancement of Science, to be held at Boulogne from September 14th to 21st next. Messrs. Cuenot and Mesnager will report on (1) motors, (2) vehicles, and (3) motor-car traffic, and this is to be presented and discussed, after which some trial runs are to be organized.

IT is probable that after all Washwood Heath district will not have a service of motor-omnibuses. At the meeting of the Birmingham Watch Committee on Tuesday morning, Councillor Waters presiding, Chief-Inspector Charsley reported that one of three of these vehicles intended for this route was inspected—and rejected. The seating accommodation was found to be inadequate. The seats were parallel, and when two passengers sat opposite each other it was impossible to get past without causing serious inconvenience. The inspector adds that he has reason to believe that the same objection will apply to the remaining two vehicles, and that the project of running these omnibuses on this route will probably be abandoned.

## THE ROAD-RACING CONTESTS AT NICE.

OUR Nice correspondent forwards us a full account of the numerous contests which took place last week at Nice, and judging from this account there are several lessons which might well be laid to heart by those organizing similar contests both in France and in England.

Fortunately for the credit of the "New Industry," as it has been termed, we are not likely to witness any such contests in England. Fortunately, too, although a few automobilists may in their enthusiasm look upon the running of motor-vehicles as furnishing opportunities for "sport," yet the majority regard them as providing "pleasure," whilst still others regard them as furnishing opportunities for "commercial enterprise." Road-racing with motor-vehicles might perhaps become popular with those who cannot enjoy life without voluntarily incurring danger, but to those quieter disposed folks who prefer to take their pleasures without material risks, motor-vehicle racing whether on path or road is undesirable.

In regard to the Nice races, it may be said at once that those who made themselves responsible for their organization and for the selection of the routes to be traversed had neither studied their duties very carefully nor carried them out satisfactorily. The route chosen for the Nice-Castellane-Nice contests proved itself to be impossible to be traversed, even at very ordinary speeds, for from Grosse the hills were stupendous and at the same time the roads at the most dangerous parts were strewn with large rocks on one side and were bounded by a yawning ravine on the other. Of the nineteen entrants several endeavoured to traverse the course before the race, but as a result very few succeeded without meeting with severe accidents, perhaps the most severe occurring to Gingolty, who rode a tricycle. His injuries are sufficient to prevent his racing for many a long day.

As a result nearly all the competitors refused to start unless the route was altered, and consequently the authorities decided on the evening of the 20th inst. that the course would be altered to Nice, Castellane, Puget, Théniers, and Nice, and that many parts of the route would be declared neutral ground on which no racing would take place. As a matter of fact, all racing through Puget, Théniers, and Castellane was stopped. After leaving Nice 92 kilometres of the route were "neutralised," racing only commencing again about 30 kilometres' distance from Nice. In regard to the race for "touring" vehicles the course at the last moment was changed to Nice-Gattières-Maganosc-Nice, instead of Nice-Maganosc-Nice. At the last moment, too, Monsieur Bardou, the "Prefet" of Nice, died, and it then became uncertain whether after so many changes the races would take place at all.

Ultimately, however, all the "tourist" and "speed" competitors gathered together on the Promenade des Anglais at Nice, and at 7.10 exactly M. Giraud was the first to start on the terrible trip. The next in order to show the rears of their vehicles were MM. Giradot, Charron, De Dietrich, De Turckheim, Leys, Brouhot, Decauville, Archdeacon, Lemaitre, etc., twenty-four carriages starting in all. The motor-cycles next started, and these included Marcellin, Osmont, Jacquelin, Teste, Tart, Beconnais, etc.

The last starter in the carriage section was Lemaitre, who drove a Peugeot fitted with a motor of 18 h.p. Before he had covered 500 yards he had to stop to repair a puncture in his tire, which a large nail had pierced. He lost as a consequence fourteen minutes, but this he speedily made up before he reached Castellane, notwithstanding the fact that two additional punctures further hampered him. Having regard to the power of his motor it is not wonderful that Monsieur Lemaitre was able to negotiate all the hills at the rate of forty kilometres an hour, passing all the other vehicles quite easily, and, indeed, leaving several of them as though they were standing still. As a result M. Lemaitre arrived first at Nice, his Peugeot carriage covering the dis-

tance in 2 h. 52 m. 50s. The times of arrival at Nice were as follows :—

## CARRIAGES.

1. Lemaitre (Peugeot), 2 h. 52 m. 50 s.
2. Girardot, 3 h. 19 m. 20 s.
3. Kœchlin, 3 h. 22 m. 45 s.
4. Loysel, 3 h. 25 m. 55 s.
5. De Turckheim, 3 h. 26 m. 45 s.
6. Georges, 3 h. 35 m. 30 s.
7. Charron, 3 h. 35 m. 40 s.
8. Archdeacon, 3 h. 40 m. 45 s.
9. De Dietrich, 3 h. 43 m. 50 s.
10. Levegh, 3 h. 51 m. 40 s.
11. Roscoff, 3 h. 54 m. 30 s.
12. Buisson, 4 h. 1 m. 10 s.
13. G. Leys, 4 h. 10 m. 30 s.
14. Schneider, 4 h. 24 m. 6 s.
15. Decauville I., 4 h. 27 m. 30 s.
16. Brouhot, 4 h. 59 m.

## MOTOR-CYCLES.

1. Teste, 2 h. 59 m.
2. Rigal, 3 h. 20 m. 37 s.
3. G. de Méaulne, 3 h. 28 m. 4 s.
4. J. Jouan, 3 h. 51 m. 55 s.
5. Caron, 3 h. 58 m. 36 s.
6. Jacquelin, 4 h. 57 m. 30 s.

Marcellin was rather severely hurt on this journey, and it is only due to his presence of mind that he was not dashed to pieces. Going down a hill he found a sharp turning, the road being bounded on one side by a ravine. Finding it impossible to negotiate the turning at the pace he was travelling, and equally impossible to stop his vehicle without serious chance of danger, he permitted his machine to precipitate itself down the ravine, throwing himself off the seat on to the road just as the edge was reached. Although Marcellin received several severe contusions, his presence of mind and pluck undoubtedly saved his life.

Another accident occurred at the same place to a driver of one of the Decauville voituresses. He had a severe fall and broke both his arms.

In regard to the winner in the motor-cycle class it must be mentioned that M. Teste had *two* De Dion motors of 1½ h.p. each fitted to his machine, which fact naturally gave him the advantage in climbing the hilly roads.

In the tourist carriage class no serious accidents are reported. The contestants started from Nice at ten o'clock, and the order of their arrival was as follows :—

## MOTOR-CYCLES.

Géo, 2 h. 21 m. 56 s.

## TWO-SEATED CARRIAGES.

1. Motocadre, 2 h. 58 m. 18 s.
2. Mme. Dhasty, 3 h. 13 m. 55 s.
3. Lacotte, 3 h. 25 m. 30 s.
4. Duquesne, 3 h. 52 m. 50s.

## FOUR-SEATED CARRIAGES.

1. Mercédès, 2 h. 27 m. 30 s.
2. H. de Rothschild, 2 h. 34 m.
3. A. de Rothschild, 2 h. 40 m. 30 s.
4. Comte de Vos, 2 h. 46 m. 40 s.
5. Clérissy, 3 h. 4 m. 2 s.
6. Gauthier-Wehrlé, 3 h. 15 m.
7. De Fabrègues, 3 h. 34 m. 5 s.
8. Vauquelin, 3 h. 38 m. 15 s.
9. Delizy, 3 h. 40 m. 35 s.

## SIX-SEATED CARRIAGES.

1. Buisson, 3 h. 54 m.

As will be seen from the above, Madame Dhasty arrived second in the class for two-seated vehicles, and this success of a "chasseuse" in such an important contest will no doubt be received with acclamation by her numerous fair colleagues in Paris.

The kilometre race took place on the 23rd inst. on the Promenade des Anglais, and, as was to be anticipated, Monsieur Lemaitre, in his 18-h.p. Peugeot, won quite easily, beating in the final heat, and covering the kilometre in forty-seven seconds, which represents seventy-six kilometres an hour.

In the motor-cycle series, M. Beconnais got the better of Tart. Altogether this event was not considered to be otherwise than disappointing.

The hill-climbing race up the Turbie took place on the 24th inst., and resulted in an additional success for M. Lemaitre on his terrible Peugeot vehicle. The distance was covered by him in 24 minutes 23 seconds, the next arrivals in the two-seated carriage class being as follows :—

2. Giraud, 26 m. 42 s.
3. De Dietrich, 28 m. 51 s.
4. Loysel, 28 m. 53 s.
5. Buisson, 29 m. 57 s.
6. De Turckheim, 30 min. 47 s.
7. Archdeacon, 31 min. 42 s.
8. Kœchlin, 32 min. 22 s.
9. De Dietrich, 33 m. 34 s.
10. Edmond Georges, 36 m. 32 s.
11. Schneider, 41 m. 56 s.
12. Motocadre, 42 m. 45 s.
13. Hachette, 48 m. 40 s.
14. Brouhot, 52 m.

## FOUR-SEATED CARRIAGES.

1. Audibert-Lavirotte, 48 m.
2. H. de Rothschild (No. 102), 43 m. 34 s.
3. A. de Rothschild (No. 103), 46 m. 34 s.
4. Roscoff, 49 m. 19 s.
5. Lacroix, 1 h. 12 min. 45 s.

## SIX-SEATED CARRIAGES.

1. Guyenet-Balvay, 1 h. 31 m. 51 s.

## MOTOR-CYCLES.

1. Gaëtan de Meaulne, 26 m. 47 s.
2. Béconnais, 27 m. 42 s.
3. Jacquelin, 28 m. 2 s.
4. Demester, 30 m. 8s.
5. Legras, 35 m. 52 s.
6. Geo, 39 m. 27 s.
7. Duquesne, 39 m. 43 s.
8. Roubert, 48 m. 43 s.
9. Garin, 52 m. 22 s.
10. Tart, 53 m. 16 s.

The distance covered in this contest was 16 kilometres 200 metres, and this was traversed last year by M. Michelin in his steam-carriage in 31 minutes 50 seconds, so that M. Lemaitre's vehicle shows considerable progress this year so far as speed goes, but it must also be added that the horsepower is also materially increased.

The "concours" for "carriages de luxe" was not very interesting, although some fairly luxurious and elegant carriages took part. The prize was awarded to a Peugeot vehicle, the body being furnished by Kellners.

Consequently all the chief honours of the Nice races fell to Peugeot, whose vehicle, driven by M. Lemaitre, was first in all the principal competitions for carriages. The result cannot be regarded as extraordinary in view of the horse-power of the motor employed, but nevertheless great credit accrues to Monsieur Armand Peugeot in view of the fact that only one carriage was employed, and that no mechanical accident or breakdown interfered with its performing the arduous tasks set out for it, and the following of the really terrible and dangerous routes selected for some of the races.

THE Rochester Electric Motor Co., of Rochester, U.S.A., has been incorporated with a capital of £2,000.

THE Belgium Automobile Club proposes to organize a motor-car meet and a number of races at Namur this summer.

IN Munich, motor-car drivers must be examined by the police commissioner before being allowed to take charge of motor-cars.

A NEW firm has just been registered at Billancourt (10 Avenue du Cours) France, with a capital of £2,400, under the style of Messrs. Renault & Co., to manufacture motor vehicles.

THE Hollandsche Automobielen Maatschappij is the name of a company which has lately been formed at Delft, Holland, with a capital of 50,000 fl. to establish a service of motor-vehicles between Delft and Rotterdam, and between Delft and The Hague. It is anticipated that the service will be inaugurated in May next.

## The "Tauzin" Voiturette.

FIG. 1.—GENERAL VIEW OF CAR.

FOLLOWING on the description of the "Union" voiturette, given in our last issue, we are now able to give some particulars, with illustrations, of a new two or three-seated light vehicle recently introduced by Messrs. Tauzin & Co., of 11 Rue Bellanger, Levallois-Perret, Paris. The frame of the vehicle is built upon steel tubes, *ee* (Fig. 3), well braced together by the solid stays *e'*, *e''*, *e'''*, the body of the vehicle being supported on the frame by strong springs. To deal first with the motor (Figs. 4 and 5), which is carried on the front end of the frame,

spur wheels *e*. The ignition is effected electrically, the sparking arrangement being controlled by a cam on the motor shaft outside the cover.

The carburettor *C* (Fig. 3) is of a special type; it consists of two metal concentric boxes, in the centre of which is a series of cotton wicks. These wicks become saturated with petroleum spirit, and are so arranged as to offer a large evaporative surface. Air is free to circulate between the outer and inner boxes, and passes into the interior of the

FIG. 2.—SECTIONAL ELEVATION OF "TAUZIN" VOITURETTE.

this is of the firm's two-cylinder petroleum-spirit type, and is known as the "Papillon." The two cylinders *CC'* (Fig. 4) are set in the same vertical plane, but at a slight angle to each other. It will be seen from Fig. 5 that the motor shaft *A* is in two parts, each carrying on their inner ends, within an aluminium oil-containing case *B*, discs *VV'* which take the place of the usual crank. Between these two discs two cranks *VV'*, set at an angle of thirty-six degrees to each other, are mounted, and to these the two pistons *DD'* are connected through the obliquely-fixed piston rods *dd'*. The admission and exhaust valves are mounted on opposite sides of the cylinder tops; the former work automatically, while the latter are controlled by a cam carried on a small shaft driven off, and at half the speed of, the motor shaft through

FIG. 3.—PLAN OF FRAME &amp; TRANSMISSION GEAR—"TAUZIN" VOITURETTE.

latter through holes pierced all round almost to the level of the spirit; the air thus comes in contact with the saturated wicks, the resulting hydro-carbon vapour passing to the motor along an upper pipe, in which is introduced a valve, fitted with a butterfly regulator, for the admission of the necessary amount of pure air to the explosive mixture.

For cooling purposes, the cylinder, as also the admission and exhaust valves, are fitted with radiating flanges, those round the cylinder being of copper, the placing of the motor in front allowing a constant stream of cool air to play on the same. The motor, which weighs just about one cwt., is, it is stated, capable of working up to  $3\frac{1}{2}$  h.p.

Coming now to the power-transmission mechanism, the motor is, as already mentioned, located on the front portion of

the frame, at *M* (Figs. 2 and 3). The motor shaft *A* extends the whole length of the vehicle; at *E* a friction clutch is interposed in the shaft, the two halves of the clutch being held apart by means of the spring *r*; thus, by means of the foot pedal *F* (Fig. 2) the motor can be instantly cut off from the transmission gear. Three forward speeds,  $5\frac{3}{4}$ ,  $10\frac{3}{4}$ , and  $17\frac{1}{2}$  miles per hour, and one backward motion, are provided. At the end of the longitudinal shaft *A* are loosely mounted three bevel pinions  $V^1$ ,  $V^2$ ,  $V^3$  (Figs. 2 and 3), gearing on a similar number of rows of bevel teeth  $e^1$ ,  $e^2$ ,  $e^3$  fixed around the differential gear on the rear road-wheel axle. These pinions run loosely on the shaft *A*, but are always in gear with their respective set of teeth on the differential, the desired speed being obtained by making the corresponding pinion solid with

FIGS. 4 AND 5.—SECTIONAL VIEWS OF "PAPILLON" MOTOR.

the shaft. This is effected by means of a sliding key *c'* controlled by the handle *m* on the steering pillar through suitable levers and the sliding piece *U*. This sliding key *c'* is so arranged that it can be interposed between the shaft and any one of the three bevel pinions  $V^1$ ,  $V^2$ ,  $V^3$ , thus transmitting the power of the motor to the rear road-wheel axle at any desired one of the three speeds available. The reversing motion is effected by means of the bevel wheels *G*, controlled by the handle *m'*, the direction being determined according to which of the two vertical pinions are in gear with the horizontal one.

Steering is effected by means of the front wheels, which are mounted on the usual short vertical pivots. At the lower end of the steering standard *D* is a small pinion *D'*, which gears with the racks *a*, connected with the levers to the front wheel pivots.

The oil-storage tank is located at *R* under the seats, while a silencer for the exhaust is placed at *S*. The wheels are of the bicycle type, fitted with pneumatic tires. The foot pedal *F*, which controls the friction clutch *E*, is also connected with a band brake on the differential gear *d*, the depression of the foot pedal not only throwing out the clutch but also at the same time applying the brake. Shoe brakes on the rear wheel tires controlled by a hand lever can also be provided.

It is reported that last week Dr. Roberts, the medical officer for the New Winchester Rural District Council, met with a slight accident whilst riding his motor-cycle. According to local reports, he was coming down the Alresford Road to Winchester between five and six o'clock, when "the oil tank exploded and set fire to his clothes, but he prevented injury to himself by rolling in the snow." The cycle, however, was completely wrecked. We have asked Dr. Roberts for particulars, but up to the time of going to Press with the present issue have been unable to procure them. As reported, the "accident" seems incomprehensible, but further information will doubtless tend to elucidate the apparent mystery, when we shall probably find that the "explosion" was due to a leaking pipe and the consequent igniting of the spirit.

## SCOTTISH NOTES.

### The Approaching Season.

THERE is considerable activity among motor-car owners just now in connection with the painting and overhauling of their carriages for the fast approaching season, and naturally the motor works are busy; in fact several owners have had to put up with disappointment, owing to having neglected matters, until such a period that coachbuilders could take in more work.

### The Ignition Question.

THE discussion which has for weeks past been engaged in by more or less informed persons in the south on this subject has naturally not been without its interest here. The matter is an important one, and should receive careful consideration. Personally I have had more practical experience with "tube" ignition than with the electrical, and provided a driver understands his burners, and periodically renews the wicks, he need have little trouble except perhaps when a gale is blowing. Various contrivances have been invented to protect burners under these conditions, but I cannot say that I have met with any which have proved perfectly satisfactory. In this respect, at least, electrical ignition leads, and although I have had long and favourable experience of the "tube," I am of the opinion that with the rapid improvements which are being effected in the electrical methods, this will prove to be the ideal ignition, and will be found to become increasingly popular every year.

### The "M.-C.J." and Scottish Cycle Trade Journals.

THE advent of *The Motor-Car Journal*, with its fresh Scotch news, has had the effect of leading the Scottish cycle trade journals to devote a much larger amount of space to motor-car matters. Much of the work, however, indicates the liberal use of "scissors and paste" and absence of practical knowledge of the subjects discussed. I am quite aware of the difficulty which many journals experience in procuring the services of a "specialist" qualified to write on an entirely new subject, yet it is of the utmost importance that in the work of educating their readers in the matters of automobilism, the information furnished should be accurate, and that the knowledge it is desired to instil is practical, in order that the deep-rooted prejudice—which in some minds still exists—to such a radical change in our methods of road locomotion should be the more speedily and surely removed. I observe, by the way, that more than one of the pars from my "Notes" in the first issue of *The Motor-Car Journal* were copied last week by one of the cycle periodicals referred to—but without acknowledgment. It was news—only three weeks old.

### Motor-Hiring Activity.

I THIS week had the pleasure of visiting the motor-hiring establishment at Hamilton. The company's premises are centrally situated, and the entrance is on the main thoroughfare of the town. I found the depôt capable of accommodating close on twenty cars, and replete with all the appliances necessary for the expeditious handling of the company's vehicles and for their cleaning and repair. The carriages are chiefly Stirling-Daimlers, and number over a dozen. They are of various types, including Stanhopes, wagonettes, omnibuses, phaetons, parcel vans, and lorries. Many of the vehicles are being repainted for the season, and look very attractive. The prospects for the season in this district are, I learn, exceedingly good, and with so well-equipped an establishment it should prove a profitable year to the company.

THE NEW PENNINGTON-STIRLING SOCIABLE. (SEE "A MAIDEN TRIP.")

#### A Maiden Trip.

At the invitation of Messrs. Stirling, of Hamilton, I had the pleasure this week not only of inspecting but of having a trial run on board the first new Pennington-Stirling motor-car completed by the Hamilton firm, an illustration of which is given herewith in Fig. 1. The car is, I understand, what will be hereafter known as the "Sociable." It is seated for three persons—two are carried on a commodious front seat, and one on a small seat behind but looking to the front—indeed, almost similar to the "rumble seat" on the old park phaeton. This seat should be very suitable for a servant or attendant when ladies are driving alone. The body is in natural walnut and well finished and varnished. The upholstery is in durable brown rain-proof cloth. A very noticeable feature in the carriage-building portion was its lightness and strength and the ample knee-room provided on both seats. In this latter respect it contrasted very favourably with many other types of automobiles in which I have ridden. The general appearance of this new Pennington-Stirling car is good, and it is altogether unique in regard to the method of construction of the under-frame. The small pneumatic-tired tangent wheels are new to us in this country, and as a whole the effect is most pleasing. It is a low-set vehicle, easily mounted and dismounted, and one experiences a pleasant sense of safety when riding in it. Its running pleased me most of all. On the trip of some twelve to fifteen miles the motor worked with unfailing regularity, and I was delighted with the manner in which it took some of the moderate hills met with on the high gear. On enquiry I learned that the new "Sociable" fitted with a single-cylinder motor, such as the one I had the pleasure of testing, will be sold at somewhere about 140 guineas, and at this figure it appears to be thoroughly good value and marvellously cheap. It needs no prophet, I think, to predict that the demand for these vehicles will this year be enormous. The seat-rails are nickel-plated, and the seats are upholstered in cloth. When desired, a light waterproof hood can be supplied. As the body is suspended on light graduated steel springs all vibration from the frame, to which the motor is affixed, is intercepted, with the result than as easy riding is secured as in the best-designed horse-drawn vehicle. When constructed

to carry four persons, the back seat being widened for the purpose, a twin-cylinder motor is employed, and the vehicle, even when thus fitted, weighs only 4 cwt.

#### Easter Runs.

THE need of a club nearer home is the more keenly realised when the holiday season arrives. It is too far to journey to London to take part in the tours of the Automobile Club, and many of the Scotch members have to content themselves with tours on their own account, which, after all, are perhaps not much less enjoyable for that reason. We have a lovely touring country, and to "tour" by motor-car is to experience a new and fascinating delight. So soon as the new club is instituted, this is doubtless a department of work which will receive special consideration.

#### The Notes.

I AM pleased to learn from various sources that *The Motor-Car Journal* is being welcomed by the many interested in motor matters in Scotland, and further that the "Scottish Notes" are appreciated by its numerous readers. It will be my endeavour to faithfully record passing events of general interest and to keep my readers in touch with everything of importance in connection with the development of automobilism in Scotland.

#### A New Car for Edinburgh.

THIS week a new motor-wagonette was placed on the streets of Edinburgh for public hire. It is, I understand, the property of a private firm who have just gone into the motor-hiring business. The wagonette is a very handsome vehicle, built by Stirling's Motor-Carriages, Limited, of Hamilton, on the "Daimler" system. It is seated for eight or nine persons, and is somewhat after the type of the vehicles which have been run for some time past by the Edinburgh Autocar Company. The intention, I believe, is to let out the car on hire by the day, week, or month. Edinburgh is certainly a place presenting ample scope for business of this kind.

BROWN HEATHER.

## CORRESPONDENCE.

## MR. WRIDGWAY AND THE SPEED OF HIS TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was extremely pleased to read Mr. Wridgway's letter of the 18th inst., as he clears up a number of points over which I was in doubt. I did not know the facts about the race at Sheen House, but if they were as he states it would, of course, seriously affect the speed of his tricycle.

I am glad to hear how Mr. Wridgway's estimate of his speed was obtained. He bases his assertions upon statements made by the Automobile Association, and refers to the speed claims set forth by them. I was quite sure that the statements made by Mr. Wridgway were not based upon his own calculations, as he is, I believe, too good a judge of speed to make an assertion loosely. Twenty-four miles an hour and thirty-three are very different things, as Mr. Wridgway will quite appreciate. Of course I am only referring to England, and do not wish to doubt Mr. Wridgway as to what he did in France.

I am obliged to him for his explanation about a tricycle on the track being slower than on the road, although I have never had the opportunity of proving this. I also thank Mr. Wridgway for his offer of a seat upon Messrs. Pennington and Baines' car (which he now points out is a racing car), but I have been on it before—a long time ago.

London, S.W.

Yours faithfully,  
"CYNICUS."

## WANTED: A VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I happen to be one of a large number to whom pedalling is debarred; and the motor-cycle makers in no wise help us. What we want is a reliable, inexpensive motor-vehicle that will take us about. Pray open your columns to our aid and service. We don't want elegantly-upholstered cars. What we need is something that will convey us reliably about at a moderate pace, and so bring us on a par with our more favourably placed brothers and sisters who can cycle.

Newbury, Berks.

Yours, etc.,  
R. LOVELOCK.

## THE MORS V. THE PENNINGTON VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We really feel highly flattered by the letter of the Automobile Association in your issue of the 17th inst., as, to our knowledge, the "Mors" is the fastest, and in many respects the best, of the heavy motor-cars thus far put on the market; and the wish of the Association to match their four-cylinder 380-guinea car against our one-cylinder 125-guinea car is a measure of the success we have attained in the eyes of our shrewd opponents. Had this been the view taken by ourselves solely, we might have thought there was a mistake somewhere, but we have been congratulated on the matter both personally and by mail from many quarters, and our friends seems to have regarded the matter in the same light, namely, as a striking compliment to our car.

A Scottish gentleman who comments upon the matter suggests that the fairest contest, and the one that would interest the public, would be between a "Pennington" two-cylinder motor and a "Mors" two-cylinder motor, each motor having same diameter of cylinder. On these conditions, which are obviously fair to both competitors, we shall be delighted to race for a distance of not less than 500 miles with the Automobile Association. We, however, must state that we would not care to go into a race with each party entering five or six cars, for obvious reasons. Are the Automobile Association afraid that they cannot get through with one car? If one car will not go through, it is useless to

have five. We are well aware of the fact that it is a favourite idea of French makers to put many cars of the same pattern in a race. Some time ago, when the Count De Dion wished to race us, he intimated that he would put in from a dozen to twenty machines in a 200-mile race against our car; so this plan of plural entries is quite an old one in France.

Yours faithfully,

PENNINGTON &amp; BAINES.

## THE N.C.U. AND MOTOR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you may be aware I have arranged a match on motor-tricycles to be ridden on Easter Monday between one of the best-known Parisian motorists, M. Rigal, and the, to us, better-known English rider, C. G. Wridgway. As these men will start from opposite sides of the track and will both be going for the record, it is necessary to have a timekeeper each. I had already notified our official timekeeper, G. P. Coleman, that he and another timekeeper would be wanted for the cycle meeting, which begins half an hour after the conclusion of the motor match, and, not wishing to have the trouble of engaging another set for the match, I wrote to him on the 11th inst., asking whether the N.C.U. would object to his companion and himself timing it. To this, on the 25th inst., I received the following reply:—

DEAR BAILY,—I have got leave for ——— and I to time the motor races, provided Wridgway and the Frenchman take out licences, which can be obtained from Dr. Turner at once in the usual way.

Yours truly,  
P. COLEMAN.

This seems to show that it is the intention of the N.C.U. to apply all the rules and regulations by which they have tied up cycle racing also to motor racing. However much this process may be required in that sport, and however necessary control of some sort may be required for motor competitions, to use exactly the same rules, many of which cannot obviously apply to motors, is an attempt that, either through lack of knowledge or thought, may do incalculable harm to a form of sport that at the present juncture seems one to be cultivated not harassed. It also shows that the National Cyclists' Union is not the proper body to have control of the pastime of motor racing. Are all the motorists of England who may wish to ride in a race on the track willing to go through the fearful ordeal of obtaining N.C.U. licences by filling up the whole page of questions on the application forms? Are they willing to become professionals if they compete against or make the pace for a man who may have been declared a professional by the National Cyclists' Union through an infringement of one of its many clauses; or are they prepared if they ride in a road race and have the misfortune to be the holder of a N.C.U. amateur licence to have it revoked, and so become *ipso facto* a professional, and if holding a professional licence to be suspended? I trow not. In the case of our Easter Monday match one of the riders (M. Rigal) is riding in the Paris-Roubaix road race on Easter Sunday, and is therefore not eligible to hold a National Cyclists' Union licence. Wridgway, I fancy, has done some pacing on the road, and is therefore also in the same category. Consequently I have engaged two other timekeepers who are not under the control of the N.C.U. Will the Union tell us in what way a professional motorist has an advantage over an amateur? Will not the members of the engineering profession always have a better chance than an ordinary motorist in these races? Will the Union declare them professionals? Is it not the machine and the skilful manipulation of same that will win the race? Therefore, where is the necessity of dividing the two classes?

Yours truly,

94 Oakfield Road, Penge, FREDK. W. BAILY,  
March 29th, 1899. Hon. Sup. Crystal Palace Cycle Track.

# MR. EDGE AND THE PENNINGTON CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. S. F. Edge's letter in your issue of the 17th inst., in fairness to the public we think he ought to define his interest in motors, as he is at present posing as an impartial authority, whereas any statement or opinions he may publish would be considerably discounted if, for instance, he were known to be interested with Mr. H. J. Lawson or with the British Motor Syndicate, Limited, in some contemplated flotation of a new company to work motor-cycles. We notice that the Ariel Cycle Company announce in their advertisements that they are fitting their motor-tricycles with Dunlop motors under licence from the British Motor Syndicate, and we have been informed, rightly or wrongly, that Mr. Edge is the active and controlling spirit behind this combination. Many people have asked us: "Who is the Mr. S. F. Edge who is such a frequent contributor to the papers on motor-car subjects? If he is simply an enthusiastic motor-carist, who, as a private individual, is anxious to help on the new industry—well and good; but is he working his name in in order to grind his own axe and also that of Mr. Lawson, and is there any truth in the rumour which is circulating, namely, that shortly there will be a new flotation in which some persons whose names are familiar in connection with the Dunlop Tire Co. and the British Motor Syndicate will figure, if not prominently, at least effectively behind the scenes as wire-pullers?"

Mr. Edge can probably tell us how much truth there is in the rumour, and, anyhow, the public are entitled to know whether he is a director of the Ariel or of any other motor company, and, consequently, how far he can be relied upon as a would-be impartial critic of other motors.

Yours faithfully,

March 28th, 1899.

PENNINGTON & BAINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to thank you for the opportunity of replying to Messrs. Pennington and Baines' letter which appears in your current issue.

I certainly will have the very greatest of pleasure in answering all the queries raised by Messrs. Pennington and Baines, but at the same time I cannot help thinking that if they had refrained from a personal attack on myself and answered my queries in a straightforward businesslike way everybody would be more interested and better pleased.

Speaking personally, I have tried, ever since I have seen Messrs. Pennington and Baines' motors advertised and what they would do, to get one. When they were first advertised some two or three years ago, and somewhat similar claims to the present set forth, I wrote several times, both by registered and unregistered post, for particulars, prices, and date of delivery for one of their cars.

At that time I had no experience in regard to motors, and I took it that the claims made in their advertisement would all be justified in use. Of course, I now see that evidently that vehicle was not an efficient commercial vehicle or it would be in existence to-day; so I have to thank the gentleman who looked after Mr. Pennington's business at that time for their unbusinesslike conduct in, at any rate, saving me buying what would appear from our present knowledge not to have been a successful car. However, this is by the way, and I will now answer the queries raised.

First, in answer to their wish for me to define my interest in motors, this I have pleasure in doing. It is simply that I am a director of the Ariel Cycle Company, who buy the best motors in the best market for fitting to their tricycles, and who will, I have no doubt, always be open to buy the best motor that is going.

I am also a director of Paris Singer, Limited, which is a company who own at present a special type of gas and oil engine, whose business has chiefly been in high-speed stationary engines, but who are now making engines for heavy cars.

I am also a director of the Dion-Dunlop Company, which

is a company who have a fairly large interest in working the patents of Messrs. Count de Dion and Bouton.

In regard to their query as to what I am personally, I am afraid I must plead guilty of being an enthusiastic motor-carist, but as a private individual, who is anxious to help on a new industry; primarily because when I became a motor-carist myself some two or three years ago I was scoffed at by nearly every one I knew, but even in that short time I have seen many of those scoffers turn round to become motor-carists themselves.

I have no doubt that in due time, through being a believer in this industry and having opportunities through being a believer of becoming financially interested in what, in my opinion, are good motor businesses, I may make some money out of it. So far, I must be simply termed an enthusiastic honorary worker for the good of the cause.

In regard to any flotations that there may be remarks about, I am not interested directly or indirectly in any, nor have I ever had any experience in the flotation of companies of any description, and I feel that if there was any opening in this direction Mr. Pennington, with his great experience, would be far more capable of dealing with it than myself.

In regard to the last paragraph of their letter, I have already dealt with this in an earlier portion of my letter, the query being thus answered.

As to whether I am impartial or not, I cannot quite see how this enters into the question at the moment, as I have never criticised or discussed anyone's motors if I have personally been the slightest bit interested in anything of a similar character.

I do very sincerely trust that I may have the opportunity of seeing one of Messrs. Pennington & Baines' cars really run for a hundred miles on the road, as, if I did, no one would be quicker to acknowledge the fact; but I should like to see it in the hands of some private person who has purchased it in an ordinary business way.

Yours truly,

7 Tavistock Chambers, Hart Street, W.C. S. F. EDGE.

March 29th, 1899.

## ALARMING MOTOR-CAR ACCIDENT AT BLETCHINGLEY.

AN accident of an alarming character happened last week with the motor-car of Major H. A. Barclay, J.P., D.L., of Underhills Park, Blethingley, the chairman of the Godstone Rural District Council and Board of Guardians, and a member of the Automobile Club of Great Britain. The facts are as follows: Major Barclay started at 2.20 p.m. on his motor-car with a lady who was staying at Underhills, to see some land he had bought at Crowhurst. His groom accompanied them. As they were proceeding along the drive towards the Godstone Road entrance-gate of Underhills estate it began to blow and snow hard. Major Barclay was wearing a "slouch" hat, the rim of which was blown over his eyes. He pushed it back and lowered the speed to nine miles an hour, and was just rounding a curve in the road when the cape of his Inverness blew over his head, and before he was clear of it again he heard someone on his right side on the road shout out. The same moment he got his head free and saw a horse and cart, to avoid which latter he turned sharp to the left. whilst the occupants of the cart pulled close to their right (left) side of the road. The edging of the road, however, was high and frozen hard, and the car could turn no further, and as a result a collision occurred. The wheel of the cart, the occupants of which latter were Mr. Councillor Markham and Mr. L. Harradine, both of Earlswood, who had been to a hunting meet, struck the axle of the fore off-side wheel of the motor-car, wrenching the guiding handle of the car out of Major Barclay's hand. Major Barclay at once applied the breaks, and "threw out" the engines; the car skidded sharp round to the right, just brushing the cart and breaking one shaft of that vehicle with the shock, and then turned a complete summersault off the road and into the ditch. As the car went over Major Barclay, with great presence of mind, called to the lady to "duck" her head, and did the same thing himself, slipping down below the dashboard. The groom, who occupied a seat behind, was thrown over their heads, being trapped by the legs in some rails in the hedge on the far side of the ditch. The same instant a sheet of flame broke out all over the car above them. Major Barclay shouted to the groom to clear himself and come to their assistance, but finding that he himself was only caught by one leg, and that the fire was almost on them, he (Major Barclay) managed, with much difficulty, to squeeze himself out over the lady, who could not move herself, and dragged her out just as a sheet of flame reached where they were below the bar. The

instant they were out all the rugs and coats, etc., were one huge bonfire. The man at the back only just got free as the flames reached him. He immediately rushed round to help Major Barclay with the lady, who was cut about the head and bleeding badly. By Major Barclay's direction the man endeavoured to let off the pressure, which he succeeded in doing very pluckily, while the gallant officer tried to ascertain if the lady was much hurt. They were about ten yards below the car at this time, but the flames, and heat were so intense that Major Barclay had to pick the lady up again, and remove her further away for safety. In a short time from the moment of the upset the car body was practically consumed. It was the most providential escape possible for Major Barclay and the lady, and if they had not been thrown into the ditch, and been thus protected from the crushing weight of the overturned car, or if Major Barclay had been unable to get free, or been as much hurt as the lady, they must have both been burned alive before help could have reached them. The upset itself was bad enough, but the terrible part of the affair was the fact of the car catching fire even while in the act of turning over. We are pleased to state that the lady is progressing favourably, though she is cut and much bruised, and confined to her bed. Fortunately, Major Barclay and his groom are very little the worse. The car is a wreck, no woodwork being left.

### "FURIOUS" MOTORING AND CYCLING.

WALTER MUNN, 12 Shaftesbury Avenue, London, was summoned before the Guildford Borough Bench of Magistrates last week for furiously driving a motor-tricycle in London Road on the 12th inst. Reginald Trevor, 48 Queen's Gardens, London, was summoned for furiously riding a tricycle in London Road, on the 12th inst., and Clifford Hutton, 130 Chesterton Road, Notting Hill, and James Burden Barnes, 33 Trevor Terrace, Knightsbridge, London, were summoned for furiously riding bicycles at the same time and place. The defendants pleaded not guilty.

Sergeant Hall said at 3.35 p.m. on Sunday, the 12th inst., he was in London Road at the junction of Waterden and York Roads with P.C. Holt, when he saw the four defendants coming towards him from the direction of Guildford. Munn was riding a motor-tricycle, Trevor an ordinary tricycle, and the other two defendants safety bicycles. They were going at a very furious pace—in his opinion about eighteen miles an hour. He called on them to stop. They did so, and witness spoke to them, telling them that he thought they were going at the rate of nearly twenty miles an hour. Munn said he did not think they were going at that rate. Dr. O'Reilly came up and said he was sure they were not going beyond the regulation pace; and he thought they were going well under fourteen miles an hour. One of the defendants remarked: "I don't think you can say that." Cross-examined by the defendant Munn: He judged the pace by the rate they passed stationary objects. Mr. Munn said it was practically impossible for people to judge the rate bicycles or motors were travelling when coming towards a person.

P.C. Holt also gave evidence.

Mr. Munn said they were going at a perfectly reasonable pace. He had ridden on the road for twenty years without having an accident or without being cautioned or summoned. He was a careful rider, and would not risk his own safety or the safety of the public for the sake of going at a furious rate.

Another of the defendants stated that he had ridden for seventeen years and had never been stopped before for furious riding.

Dr. O'Reilly then gave evidence on behalf of the defendants, and said he was looking out of the window of his house when they passed. They were stopped by the police at the cross roads, and he was so astonished that he went out and remonstrated with the police. They were going at a very reasonable pace. He was a pretty good judge of speed, being a bicyclist himself, and in his opinion they were going well under the regulation speed—not more than between ten and twelve miles an hour. He based his opinion on the fact that the rider of the ordinary tricycle, a machine which was not adapted for speed, was riding easily, and it would be impossible for such a machine to travel at eighteen miles an hour. He thought the police were mistaken in this case. He was as anxious as the police to have furious motor driving stopped. He heard every word that passed, and wished to emphatically deny that any one of the defendants said: "I don't think you can say that."

Mr. Trevor said the ordinary tricycle he was riding was not adapted for speed; it being geared very low, and it was a physical impossibility to ride at eighteen miles an hour.

The Mayor said the Bench were quite satisfied on the evidence of the police that the defendants were riding at an unreasonable pace, and to the danger of the public. They would be fined 10s. each.

### LIST OF DEALERS STOCKING PRATT'S MOTOR-SPIRIT.

IN view of the Easter Holidays we give herewith an additional list of those firms keeping motor-car spirit in stock in London and the suburbs and in the provinces:

#### LONDON.

C. W. Austin,  
J. Gibbs, oilman,  
Oulds Bros.,  
Wellington Motor-Car Works,  
Taylor & Lown,  
J. Stromberg & Co.,  
Wootton & Son,  
Onward Cycle and Motor-Car Co.,  
A. Oldby,  
Southern Motor-Car and Cycle Co.,  
Paris Singer Manufacturing Co., Ltd.,

35 Brewer Street, Soho.  
High Street, Wandsworth.  
3 Market Place, Oxford Street.  
36 St. George's Square, N.W.  
2 Rosemont Road, Finchley Rd., N.W.  
Catherine Place, Clapham Rd., S.W.  
Poplar Walk, Croydon.  
417 Brighton Road, Croydon.  
167 Beckenham Road, Penge.  
59 Brixton Road, S.E.  
Manor Street, Clapham, S.W.

#### PROVINCES.

Beverley,  
Birchington-on-Sea,  
Bournemouth,  
Bradford,  
Bridlington,  
Gainsborough,  
Great Yarmouth,  
Hull,  
Leeds,  
Barnard Castle,  
Middlesbro',  
Newcastle-on-Tyne,  
Thirsk,  
Edinburgh,  
Coventry,  
Hull,  
Lynn  
Retford,  
Scarborough,  
Skegness,  
Wakefield,  
Carlisle,

J. W. Tanfield.  
E. Bushbridge, Stores, The Green.  
Birmingham Cycle Co., Holdenhurst Road.  
Mrs. Calvert.  
C. Smith.  
Heinle & Co., 50 and 168 Trinity Street.  
J. Leach, Market Place.  
King & Co., Ltd.  
G. Exley & Sons.  
Joshua Burn & Son, Horse Market.  
Constantine Pickering & Co.  
Rowland Barnett & Co., 41 Dean Street.  
Clark & Co., Market Place.  
Ayre & Son.  
Finlayson & Stewart, Regent Arch.  
Autocar Co., London Road.  
Daimler Motor Co.  
Motor Manufacturing Co., Ltd., Motor Mills.  
Hayter & Co.  
F. Morris.  
T. Walker.  
J. M. Crosby & Co.  
A. W. Rowley.  
W. Pollard.  
Fletcher Ritson, chemist and optician.

### SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

### Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### The First Motor-Car Trip to Baslow, Derbyshire.

A CORRESPONDENT sends us the following:—"I had a great piece of luck recently in running against a man in Sheffield who had a motor-car seating eight people, and who wanted a passenger and a route for a run. Some members of the Press Club and a certain number of cycle agents of the city suggested that we should load up the car and have a run to Baslow, Derbyshire. This motion was carried unanimously, and it was remarked this would be the first car to negotiate the difficult roads between Sheffield and Baslow. Ultimately, the suggestion being a good one, the party was increased to ten, and although constructed to carry but eight, the wagonette on this special occasion managed to accommodate the party of ten, including the driver. We started from the Moor about noon and journeyed straight on without hitch or trouble until the 'cravings of the inner man' required attention, which they duly received at the 'Peacock' Inn. The glorious views of the Derbyshire hills from this high spot appealed to the whole company, and I would that it were possible to secure a camera with a range long enough to take one huge photograph of this magnificent view. We lighted our lamps and started off again to Baslow, and having enjoyed a substantial lunch at the 'Royal Hotel,' the host complimented us on the appetites gained by this exhilarating run of over twelve miles in that magnificent rocky country. We paid a flying visit to Chatsworth House, and enjoyed our inspection of that historic seat of the Duke of Devonshire to the full. After leaving Baslow it was all 'collar work' for six good miles, but the motor was not 'collar-proud,' nor did it 'jib' at these stiff hills, even with its heavy load of passengers. We reached the Press Club at Sheffield in thoroughly good time, and were so pleased with this impromptu outing over the Yorkshire and Derbyshire moors that we decided to present Mr. Gilbert (a representative of the Motor Manufacturing Co., to whose kindness we were indebted for our enjoyment) with some little souvenir of the occasion. We ultimately found a means of doing so by handing him a gold scarf pin, and we hope that Mr. Gilbert may wear it long enough to give us another run on one of the excellent cars made by the Company he represents."

### "The Motor-Tricycle Explosion at Winchester."

WE briefly reported last week an accident which was said to have occurred to Dr. Roberts, the medical officer for the New Winchester Rural District Council. At the time of going to press with our last issue the "accident" was incomprehensible, it having been reported that the spirit tank had exploded, enveloping Dr. Roberts in flames, which he only succeeded in putting out by rolling in the snow. We then surmised that if an explosion did occur it was due to a leaking pipe between the carburettor or tank and the engine. From further particulars now gathered we learn that our surmise was correct, and that the accident was due

to the cause suggested. The other details of the accident as reported were, however, considerably exaggerated. There was undoubtedly an explosion, but it was a very slight one; and in regard to the rider having been set on fire, we find that a small quantity of spirit was projected on to the lower portions of his nether garments, but that the flames were very speedily and easily put out. His machine, instead of being a "perfect wreck," was but very slightly injured, and we are glad to state that Dr. Roberts was able to take part in the tour of the district by the Automobile Club on its Easter run.

### Public Motor-Vehicle Services.

THE extension of public motor-vehicle services still continues in all parts of the kingdom. Amongst the latest districts to take up this matter is Newcastle, and it is certain from the local evidence gained on the spot that residents in Newcastle and its vicinity will gladly welcome the inauguration of at least three distinct services in the neighbourhood. The other day the local papers recorded a visit of the managing director of the Motor Manufacturing Company to the district, and gave an account of the means taken to advance the establishing of a motor-car service in the vicinity. During the past week these journals have contained accounts of the visit of Mr. W. M. Hodges, the secretary of the London Motor-Van and Wagon Company, who has taken down a car and given the townspeople examples of the convenience of local motor-car services. We understand that as a result of these visits negotiations are pending for the purchase of six cars with a view to establishing at least two services in the district. Ireland also is coming to the front in this matter, for on Thursday last week a meeting was held in the Mayor's parlour at Waterford to consider the feasibility of establishing a company to own public motor-vehicles and to run them between Waterford and Dunmore during the coming season. We understand that the project has been taken up enthusiastically, and that already close upon £1,000 have been promised towards the formation of the company. Munster will thus probably be the first province in Ireland having a public motor-car service.

### Wanted: "A Volturette."

IN our last issue, in referring to the necessity of manufacturers endeavouring to supply the large public demand for a light vehicle not fitted with a pedal-starting arrangement, we ventured to criticise the altering of the old form of Bollée voiturette by placing the exhaust valve at the top of the explosion chamber instead of at the bottom, as was previously done. A correspondent, writing over the initials, "C. R. H.," has been bold enough to allege that we have made a mistake in this matter, and that the exhaust valve has never been put at the top of the explosion chamber in the Bollée motors. We publish his letter in the present issue. Our valued correspondent is, however, himself in error. We have ridden in France some two hundred miles on a Bollée voiturette with the exhaust valve placed as alleged, and have ridden over one hundred miles in England on machines of both French and English construction, the

exhaust valve being placed at the top in each case. "C. R. H." has evidently one of the old types of French-made Bollée vehicles of  $1\frac{3}{4}$  h.p. If he desires to see a vehicle constructed as described, we are quite sure the British makers of this vehicle will be pleased to show him such an one, and if desired also to give him a trial spin. It is no part of our present intention to criticise the placing of the valves, but from our own experience we judge the alteration to be a fatal one, and we are sure that if "C. R. H." had possessed a machine with the exhaust valve on top, he would not be able to record the experience he has in regard to having no trouble with the valves as fitted on the old pattern cars. In regard to the cooling of the cylinder, we regret that we cannot support either of the suggestions made by our correspondent. We certainly do not think the walls of the cylinder would be cooled so quickly were radiating fins not provided, nor can we commend the ingenious but untidy arrangement adopted by "C. R. H." We regard it as a both unsightly and inconvenient arrangement to have water slowly dripping on to the outer surface of the cylinder walls. In regard to the hill-climbing capacity of the Bollée, we support our correspondent, for with all its numerous faults, and very troublesome and annoying features, the old style of Bollée voiturette furnished a means of having thoroughly enjoyable and exhilarating runs.

#### A Reminiscence of 1834.

THE death of Mr. Robert Baillie, the shipbuilder and engineer, on Saturday last recalls one of the first attempts to run a regular service of self-propelled vehicles on ordinary roads. For Mr. Baillie had been employed in building the steam-carriages with which Mr. J. Scott Russell established regular communication between Glasgow and Paisley in 1834. These attained a speed of seventeen miles an hour, but incited the anger of the trustees of the road who allowed cartloads of stones to be placed upon the highway to obstruct their progress. Nevertheless, the service continued until a wheel of one of the carriages gave way, the whole weight of the back portion of the vehicle falling upon the boiler, which burst, causing the deaths of five persons. The Court of Session then interdicted the carriages on Scottish roads, and, for a time, two of them subsequently plied on the road between Hammersmith and London. The motive-power was supplied from the hind part of the conveyance—the weight of the carriage resting on springs—and a tender was attached intended for water and fuel.

#### The Abandonment of Birmingham's Motor-Car Service.

As we briefly announced in our last issue, the Birmingham Watch Committee refused to grant a licence to the vehicles which the Llandudno Touring Company proposed should serve the citizens. We now learn that the Company have decided not to proceed with the venture owing to this adverse decision, and will utilise the cars in some other district, where "leg-room" is not regarded from the same extravagant point of view as is the case in Birmingham.

#### The Motor Maxim Gun.

WE recorded in our last issue that the 26th Middlesex Volunteers proposed to experiment with a Maxim gun attached as a trailer to a De Dion motor-tricycle, on their Easter manoeuvres at Aldershot. Experience proved on Good Friday, however, that a  $1\frac{3}{4}$ -h.p. motor-tricycle was not sufficiently powerful to give satisfactory results. This we anticipated would be the case. The idea of trailing a Maxim gun in this way is by no means new, but the weight of the gun hanging dead on the tricycle axle puts much too great a strain on the motor and also in the gearing. Besides, we should not think the rider had a very enviable job in starting the combination, and opine that his muscular development would need to be fairly considerable.

#### The Institute of British Carriage Manufacturers.

THE Council of this Institution have arranged to hold their next meeting at York, commencing on September 12th, when the members will be received by the Lord Mayor at the Mansion House. The president (Mr. S. G. Turner, of Bristol) will deliver his presidential address, and several papers will be delivered, including one on "Aluminium as applied to Coachbuilding." Visits will be paid to Scarborough and Studley Royal. A strong reception committee is being formed, and the duties in connection with the meeting have been placed in the able hands of Mr. Johnson Wilkinson, of Huddersfield, and Mr. T. F. Wales, of York. The secretary of the Institute (Mr. Andrew W. Barr) has already visited York and made the necessary arrangements in regard to hotel accommodation and for the dinner to be held on the first evening of the conference. The original date (September 5th) was abandoned owing to the Doncaster races being held at that time.

#### Public Motor-Vehicle Services.

AMONGST other towns who are considering the feasibility of starting public motor-vehicle services is Grimsby, where Mr. Ryder has applied to the Hackney-carriage Committee for a licence to drive these vehicles in the town and its vicinity. The licence was withheld until the members of the Committee had inspected the vehicle, and, *pari passu*, had a ride in it in order to test its capabilities and the skill of the driver. A car was furnished one day last week, and a large number of the members of the Committee attended, apparently with a view of enjoying a comfortable ride. The Mayor, Alderman Louth, and several Councillors took part in the trial trips, journeying through various streets of the town and round the park. The utmost admiration was expressed with the vehicle and its performances, and, after their experiences, the Committee had not the slightest hesitation in granting a licence, which, by the way, was "granted" actually during the progress of the experimental runs. A car now runs between Grimsby and Cleethorpes, and already the patronage given to the vehicle assures the venture being commercially successful.

#### The Victor Steam Motor-Cars.

THE Overman Wheel Co., Chicopee Falls, Mass., are now exhibiting the Victor steam automobile at their works. They refer to it as perfectly automatic in character and as being so graduated that any speed from the barest motion up to whatever the owner wishes it geared to can be obtained. An average gearing is about 20 miles an hour. The vehicle is guaranteed for 25 per cent. gradients. Usually the engines are of 4 h.p., the carriage being a light one, with seating accommodation for two. The complete machine weighs about 600 pounds, and is equipped with 28-inch pneumatic rubber tires from 2 to 5 inches in diameter as ordered, a medium size being 3 inch. It is guaranteed to be perfectly safe, with no possibility of explosion, and the cost of operation is stated to be  $\frac{1}{2}$  cent a mile. Gasoline is used as a fuel to generate steam.

MESSRS. S. KRAUS & Co., of 27 Potsdamerstrasse, Berlin, have lately secured the agency for Germany for the Phebus motor-tricycles, quadricycles and light voiturettes of Messrs. Noé, Boyer & Co., of Paris.

MOTOR-VEHICLES are responsible for new words in the vocabularies of most modern languages. To describe the man who is addicted to the new habit, the French say "chauffeur" or "motorcyclist." In London he is called "autocarist" or "motocyclist." The Hollanders say "automobilist," and the Italians "carbonaro." The Germans amplify by saying "motorfahrer" or "autombifahrer."

## The Automobile Club's Easter Tour.

SNAP SHOTS ON THE AUTOMOBILE CLUB'S EASTER TOUR.—ROMSEY.

**F**INE weather and pleasant company are factors which go a long way towards making for success on a motor-car tour, and these conditions the above Club enjoyed on its Easter tour. Amongst those who took part in the run were: Mr. Frank H. Butler (Benz 5-h.p. double-cylinder dog-cart); Mr. S. F. Edge and Mrs. Edge (Panhard); Mr. C. Jarrott (Panhard); Mr. Townsend (Papillon tricycle); Mr. Herbert Capel (Benz Ideal); Mr. Chas. Cordingley, Mrs. Cordingley, and Miss Purchasehouse (Iveagh phaeton); Dr. Lehwess (Mors); Mr. Frentzel (Mors); Mr. Ernest Estcourt and Mrs. Estcourt (Daimler); Mr. Lyons Sampson and Mr. S. Beevor (Benz 5-h.p. Victoria; Mr. and Mrs. Kitto (Benz Ideal); Mr. and Mrs. A. W. Armstrong (Peugeot-Daimler); the Club wagonette (Daimler), Mr. Ernest M. Instone; the Club phaeton (London Motor-Van and Wagon Co.).

The passengers on the Club vehicles were: Mr. Roger

Wallace, Q.C., Mr. Louis d'Egville, the Rt. Hon. J. H. A. McDonald, C.B., LL.D., F.R.S., Lord Justice Clerk of Scotland (Winchester to London), Mr. Worby Beaumont, Mr. Staplee Firth, Mr. David Waterlow (London to Salisbury), Mr. Holland Tringham, Mr. Andrew W. Barr (Winchester to London), Mr. A. Poole, Mr. C. Johnson (secretary) and Mrs. C. Johnson.

The following also took part, some for only a portion of the journey: Mr. W. J. Crampton (motor-tricycle), Mr. J. Gretton (sporting drag), Mr. Fuller and Mrs. Fuller (Daimler), Mr. and Mrs. W. C. P. Wills (Benz), Slough to Reading; Dr. Acworth (De Dion tricycle), Brentford to Lyndhurst; Mr. Robert E. Phillips (De Dion tricycle), London to Lyndhurst; Mr. Peacock (Daimler), London to Lyndhurst; Mr. Buttemer and Mrs. Buttemer (Benz Ideal), Salisbury to Romsey; Mr. and Mrs. J. A. Koosen (Lutzmann), Salisbury to Lyndhurst; the Hon. John Scott Montagu, M.P.

From Photographs

THE AUTOMOBILE CLUB'S EASTER TOUR.—STONEHENGE.

by Judd, Stonehenge.

(Daimler), Lyndhurst to Beaulieu and Romsey; Mr. H. Egerton (motor tricycle), Lyndhurst to London; Mr. J. H. Knight (Benz), Winchester to Blackwater; Major-General H. P. Montgomery (Daimler), Romsey to Basingstoke; Mr. and Mrs. H. A. House and party—eleven in all—(Lifu steam wagonette), Salisbury to Winchester; Mr. John R. Hargreaves, J.P. (8-h.p. Daimler), Slough to Salisbury; Mr. Muir (Daimler), London to Longford; Mr. Mulliner (Benz), London to Hounslow; Mr. Parr (Headlands electric carriage); Mr. J. McManus (Headlands electric carriage); Mr. Oppermann (electric carriage); and at Slough Dr. Porter, of Windsor (Daimler), joined the party.

There was, we heard, the usual large crowd outside the Club premises at Whitehall Court, but this we missed through being a few minutes late at the start. We, however, on an Iveagh phaeton, soon overtook some of the rear-most cars, and at Kensington came up with the electric and several other cars. With these we kept company, with Mr. and Mrs. Edge immediately in the rear, until Hounslow was passed. A short stoppage was made at Slough for tea, and then with a comfortable run we duly reached our destination at Reading, covered with dust but in good time. About five miles before reaching Reading, a Mors car passed us, enve-

loped in a cloud of dust, whilst we also passed, but in opposite directions, several cars, including one driven by Mrs. Weguelin.

It may be interesting to note that two pneumatic tires were punctured, one being on Mr. Frentzel's Mors car and the other on Mr. Edge's Panhard—while Mr. Armstrong on his Peugeot-Daimler took from 6.30 till 11.40 p.m. to traverse the distance between Brentford and Reading, about 30 miles. About thirty-five sat down to dinner, under the presidency of Mr. Roger Wallace, Q.C.; the only toast given was that of "The Queen."

Some excitement was caused after dinner by the arrival of Mr. Jarrott on a Panhard car with the news of what might have been a serious accident. It appears that he left London rather late, and when travelling well, within about three miles of Reading, suddenly saw something white rise up just under his front wheels. This was followed by a concussion, and Mr. Jarrott, who was alone with his dog, was shot out, but fortunately was uninjured. Quickly picking himself up he was just in time to see sheep racing away up the road. He saw that his car was on its side, apparently much damaged. Assistance was soon at hand and the car was righted, when it was seen that one lamp was smashed to pieces, the other bent backwards, the splashboard splintered, the axle of the

SNAP SHOTS ON THE AUTOMOBILE CLUB'S EASTER TOUR.—HERE, THERE, AND EVERYWHERE.

near-side wheel slightly bent, the engine-casing dented, steering gear bent, etc., etc. The front of the vehicle looked as if the car had struck the road on its edge and had then gone on to its head and afterwards rolled over on to its side. Mr. Jarrott, after carefully driving his car in Reading, completed the tour on Mr. Edge's car.

There were in the stables at Reading on Thursday night sixteen cars, scarcely any two having similar bodies, and three motor-tricycles, including a "Papillon" vehicle. As we were making up our minds to retire for the night, news of another mishap arrived. It appeared that the Club car was used for the purpose of conveying a member to his home a few miles from Reading, and during the journey it was run into by a furniture van, and the woodwork of the rear seat of the car was smashed. The member arranged for some men to work all night in repairing the car, and it duly ran next day, albeit it started somewhat behind time. Dr. Lehweß and Mr. Frentzel returned to London on their Mors cars immediately after dinner, but promised to join the party again at Lyndhurst. This promise, however, was not fulfilled, to the regret of many taking part.

The next day, Good Friday, opened gloomily, heavy rain having fallen overnight; but when a start was made about 10 o'clock the sky had cleared, and by midday the sun was shining gloriously. Our destination for lunch was Whitchurch (thirty miles). Some journeyed thither by the Bath Road and others *via* Pangbourne; but a general halt was made at a charming little spot called Newtown, about two miles beyond Newbury. This Newtown was situated at the foot of two hills, and consisted apparently of only a single inn that must have been hundreds of years old; close by this inn was a picturesque old bridge and a running stream. At this spot, an 8-h.p. Daimler joined us, with Mr. and Mrs. Hargreave on board, while just over the brow of the hill Mr. Edge was seen busily engaged in repairing a puncture. Time getting on, a start was made for White Shoot Hill, a stiff and loose gradient of 1 in  $6\frac{1}{2}$  (measured by Mr. Worby Beaumont). At the foot of the hill the 8-h.p. Daimler passed us and was only just in front when it stopped dead, and so brought our car also to a standstill, compelling the passengers to get out and walk. The 8-h.p. Daimler, we afterwards heard, had to be pushed up the hill, whilst Mr. Edge's car (Mr. Jarrott driving), through slipping a clutch, ran backwards up a steep bank and had a narrow escape of turning over. Whitchurch was duly reached in good time, the hotel yard being enlivened by one member, in entering the stable, trying to take down one of the pillars, but only succeeded in smashing a lamp and splashboard. Another enterprising member on a tricycle, for the second time that day, tried to test the strength of his front wheel against a brick wall, with the result that on his second attempt he succeeded in producing a bent frame. After lunch the run over the Downs to Salisbury (24 $\frac{3}{4}$  miles) was much enjoyed, and most of the cars ran through without a stoppage, all excepting one member arriving in good time. A numerous party sat down to dinner, under the presidency of Mr. Roger Wallace, Q.C., and a pleasant evening was spent. We may mention that about 7 o'clock the 8-h.p. Daimler left us with the intention of starting on a seventy miles run.

Saturday morning opened dull but broke gloriously, and Stonehenge was seen at its best. Some hours were spent by the party in endeavouring to secure photographs, and several of these photos we have been enabled to produce in this issue. The Lifu wagonette, with a dozen passengers on board, joined us here, having been driven over from Southampton that morning. The party included Mr. and Mrs. House, Mr. and Mrs. Towsey, Mr. and Mrs. Andrews, Miss Nicholls, the American Consul at Southampton, Mr. Songhurst, the secretary to the Liquid Fuel Co., etc. On returning to Salisbury to lunch, a horse-drawn carriage was encountered with its wheels locked; the horse was out of the shafts, and the engineer on the Lifu car was seen busily at work unblocking the wheels. A little further we passed Mr. Capel on his motor-tricycle, who was evidently in trouble, and about a

dozen yards away was a third vehicle, the owner of which was engaged in making "one of those little adjustments which are sometimes necessary"! We were afterwards informed that Mr. Capel's tricycle had startled the horse in the horse-drawn carriage first encountered; the animal backed, and threw Mr. Capel and his tricycle into the ditch, fortunately without any ill-effects. The Lifu folks certainly performed a meritorious act of courtesy in helping the owner of the carriage.

The afternoon run was a short one of about twenty-three miles to Lyndhurst, and a variation was made, at Mrs. George Morrison's invitation, to visit her beautiful place, Hamptworth, at Landford. The house is beautifully situated overlooking the New Forest, and is surrounded by the estate of seven thousand acres—seven miles of land in every direction. This visit was most enjoyable, the beautiful conservatories being well worth the making of a much longer detour.

The subsequent drive through the New Forest was most exhilarating. Nothing noteworthy occurred excepting the passing of our vehicle by the Club car, which was driven by Mr. C. J. M. Instone. The chase was a long one, and the "passing" was only accomplished by the passengers bending down to the bottom of the car, to avoid the windage. The Hon. John Scott Montagu, M.P., took the chair at "dinner" that night, and the speeches were commendably brief. About eighty sat down to dinner.

Easter Sunday opened with gloriously fine weather, and the ride to Bournemouth for lunch was much enjoyed. On our way we passed a second Lifu wagonette (stationary), owned, we were informed, by a gentleman residing at Lymington, and a car belonging to Mr. Passmore, of Bournemouth, each car having a party on board. Luncheon was served at 3 p.m., and a stroll round the town was indulged in before a return journey was made. On Monday, by invitation of Lord Scott Montagu, a visit was paid to Beaulieu Abbey, and his Lordship personally conducted the party over the house, and afterwards through the ruins of the Abbey, describing in detail the many instances which has helped to render this charming place certainly are of the most interesting in that part of the country. After light refreshments the Hon. John Scott Montague, M.P., personally conducted the party on his Daimler, a pleasant and short route to Romsey. Of this charming town with its beautiful church we give several views. A long stoppage was made here, the party dividing and exploring the beauties of its environs. Proceeding on the journey we met outside Winchester General Montgomery (who took the chair in the evening) on his Daimler. A halt was made for stragglers, the party forming in procession, and thus entered the crowded streets of the old-time city.

On Tuesday morning fine rain was falling, and shortly after 10 a.m. a start was made for Blackwater, thirty-two miles. This place was reached without a stoppage, the only incident on the journey being the noticing, near Basingstoke, of a wagonette body by the side of the road, then two wheels some distance apart, and a labourer wheeling a barrow with other portions of a wagonette *debris*. It appears that the horse belonging to this vehicle shied at Mr. Barnes' Benz carriage, throwing out the driver, breaking his arm, and smashing up the vehicle. A capital lunch was enjoyed at the "White Hart Hotel," Blackwater, the tables being magnificently decorated with arum lilies, azaleas, camelias, etc., and these were afterwards presented by Mr. Gretton to the ladies of the party—a thoughtful act which was much appreciated. The rain having ceased, a pleasant ride, after a short stop on Staines Bridge for the cars to close up, landed us at the Club, Whitehall Court, in time for afternoon tea.

The distance travelled by the Club during its six days' wanderings was nearly three hundred miles, and this mileage was accomplished in easy stages, enabling the party to spend as much time as desired in visiting the various charming places *en route*. The cars all came through—the majority

SNAP SHOTS ON THE AUTOMOBILE CLUB'S EASTER TOUR—HERE, THERE, AND EVERYWHERE.

comfortably—in fact, all travelled splendidly, with one notable exception, however. Mr. F. Butler had a new double-cylindered Benz, beautifully finished by Mulliner's, Ltd., of Brook Street, W., which ran splendidly without mishap or trouble until somewhere near Staines, where we noticed him making a stoppage to put on a belt which had come off. Mr. Capel rode a Benz Car on the first day to Reading; but had ordered a new De Dion tricycle from Paris, which

SNAP SHOTS ON THE AUTOMOBILE CLUB'S EASTER TOUR!—A TALL MAN—AND Tall Words.

arrived at the hotel in time next morning for him to use it the remainder of the journey. The luggage van of the London Motor-Van and Wagon Company (Tottenham Street, W.C.), gave no cause for anxiety, being always well up to time to enable members to dress for dinner; and while it would be invidious to further particularise the cars we cannot refrain from mentioning our satisfaction with the Iveagh phaeton supplied us by the Motor Manufacturing Company. It travelled through from point to point, without trouble or adjustment. It maintained its average speed well, and confirmed our opinion that there is not a better car in the market. The shape of the car is a comfortable one, and there is an absence of extreme vibration. We had to walk one hill only on the tour, and it is just possible, we believe, that this would have been unnecessary had we not been bothered by the stoppage of a car in front. For the photographs, through which we are enabled to give our readers some idea of the scenes on the journey, we are indebted to Messrs. Herbert Capel, Ernest M. Instone, and C. Jarrott.

THE membership of the French Automobile Club is increasing at a rapid rate. The number now stands at no less than 1,740.

THE Prince of Wales is said to have taken a fancy to driving in motor-cars, and has hired one for his immediate use since he has been staying abroad. His Royal Highness assures his friends that he thinks there is no more pleasant means of travelling.

THE London Traction Haulage Co., Ltd., is the title of a company which has just been registered, with a capital of £5,000, to adopt an agreement with J. Cattermole, and to build and deal in traction engines, motor-cars, steam rollers, trucks, wagons, and other conveyances.

HERR CHR. N. SCHAD, cycle dealer, Munich, has acquired the local agency for De Dion motor-tricycles from Messrs. Cudell & Co., of Aix-la-Chapelle, the German licencees. The latter firm have also appointed Messrs. Schaller & Co., of 136 Leipzigerstrasse, Berlin, their agents in the German capital and the provinces of Brandenburg.

WE regret to announce that Mr. H. House, of the Liquid Fuel Co., caught a severe chill on the Easter tour of the Automobile Club, and had to be left behind at Lyndhurst. Mrs. House was with her husband, and, like nine out of ten of the members and friends, was lodged in an adjoining cottage, where the surroundings were such as not to be—well, conducive to a speedy recovery. We believe he was moved to his home on Tuesday, and trust that he will have a speedy recovery.

## SCOTTISH NOTES.

### A Wet Easter.]

THE weather in the West of Scotland made anything in the way of organized Eastertours impossible. Easter Monday was an improvement on Good Friday, but the roads in most places were extremely soft. Weather of the kind we have been favoured with for some time past impresses upon one the need of ample mud-guards and a suitable chain-case. The former are of course more easily procured than the latter. If, however, one will take note when a car is running at fair speed, it will be observed that most of the mud which finds its way to the driving chains proceeds from the front wheels. By a downward extension of the front mud-guards a most effective means of keeping off the mud has been found, and this at the same time, contributes enormously to the life of the chains. A simple method of obtaining the same results is by attaching a leather flap to the end of existing guards. So effective is this that it practically does away with the need of a cumbersome gear-case.

### The Scottish Club.

I HAVE been asked to remind any of the readers of *The Motor-Car Journal* interested in the formation of a Motor-Car Club who have omitted to send their names to Messrs. Mitchell and Smith, 59 St. Vincent Street, Glasgow, that it will facilitate arrangements if they will do so this week if possible. It is intended, I believe, to organize a Whitsuntide tour in the Highlands in connection with the club, and it is certain to create a good deal of public interest. The support already promised bids fair to secure the firm foundation of the club, but it is of course desirable to "draw to the fold" every possible member.

### The Falkirk Motor-Hiring Co.

In the thriving and populous burgh of Falkirk there are to be found many far-seeing and enterprising people. It is not at all surprising therefore to learn that Falkirk possesses one of the most successful and best-managed motor-hiring concerns in the country. The Company is a private one, having as chairman a well-known and highly-popular county gentleman, Captain J. F. Livingstone, of West-quarter, and the success so far attained is to a large extent due to his energy and personal devotion, which has been ably augmented by the Company's manager, Mr. Thos. Dodds. The Falkirk and District Motor Co., Ltd.—to give the Company its full title—has an excellent depôt, fitted up with the necessary tools and other appliances, and their own staff undertake the bulk of their own repairs. They own a fleet of some eight Stirling-Daimler cars in several designs, and during last summer the Company's vehicles were to be found all over the country with their parties of tourists, the cars being extremely popular and in great demand. I understand that the Company are looking forward to a good season this year. Here, as in other places, trouble has been experienced with car drivers, the supply of which last year was naturally limited, and therefore proprietors were to a large extent in the hands of their men. That many of the drivers are capable men, with their employers' interests at heart, I know from personal observation, but that others are quite the reverse there has been ample evidence, and I am informed that their culpable negligence in some cases led to more or less serious accidents, bringing the new vehicles into disrepute. This season, however, will witness a change in this respect, the supply of men, I am informed, being ample, and, very naturally, only the best men will be retained. Every year there is bound to be an increasing number of openings for steady, intelligent young men as drivers, and I understand makers are doing their best to meet this demand.

**The Motor Industry and Investment.**

THAT the motor industry presents opportunities for the profitable investment of capital is undoubted, and this in spite of the evil which has been wrought through the greed of promoters who placed inflated values on motor patents. Fortunately for Scotland the motor business at its birth got into the hands of people of repute whose name was a guarantee in itself. The prospectus of the first Scotch Motor Company (Stirling's Motor Carriages, Ltd.) bore this out, and presented a very striking contrast to the prospectuses of some of the early English companies, especially in the fact that the vendors stipulated that the purchase price for their business should be paid not in cash but wholly in the shares of the Company. The public appreciated this and their confidence and support was secured—a matter of no small importance in the development of a new industry. Not only was this Company unique in its promotion but also in its operations, it being also the first autocar manufacturing company to pay a dividend to its shareholders. I record these facts to show that in Scotland those interested in the motor-car movement are going about the new business in the right way.

**An Ideal Touring Car.**

A MOTOR-CARRIAGE of a somewhat uncommon appearance passed through Edinburgh one day this week on its way north. From what I saw of it it seemed to me to be an ideal car for touring. It was fitted with the motor in front, in the usual Daimler fashion. It was of the wagonette type, but its chief interest lay in its portable top. This entirely covered the car from front to back, including the driving seat. The frame-work was extremely light, with roof of waterproof material. In front, above the dashboard, there was a large plate-glass window, hung on hinges at the top. In the centre of the sides were two more windows on similar hinges, and leather curtains to roll down. In fine weather the windows all hinge up inside, and are buttoned to the inside of roof, and with the curtains rolled up there is nothing left to obstruct the view of the occupants. With the windows closed and the curtains down and fastened with the convenient screw buttons, nothing, I think, could be more comfortable in stormy weather. I observed also another item, which must add greatly to the comfort of the passengers on the driving seat. It has often been felt that in cold weather it is very difficult to keep one's feet protected when driving, the pedals having to be operated from time to time, and, no matter how closely an apron may be made to fit, the cold wind finds its way in. On this car two close-fitting side doors were fixed, comfortably upholstered on the inside, most effectively keeping out the cold. To people who desire to have the greatest degree of comfort in touring by motor-car, it would be difficult to find anything more suitable.

BROWN HEATHER.

LA Société Commerciale d'Automobiles of Paris has just declared a dividend of 16 per cent. for the year 1898.

WE learn that the Star Cycle Co., Ltd., of Wolverhampton, are taking up the construction of motor-tricycles, utilizing the well-known De Dion motor.

THE Motor Carriage Co., of Ontario, at Toronto, has been incorporated with a capital of £50,000 to manufacture carriages, etc., to be propelled by electricity.

THE Austrian Automobile Club is organizing a motor-cycle hill-climbing race over the Exelberg, between Neuwaldegg and Königsstetten, near Vienna, for the 30th inst.

THE Washington (U.S.A.) Automobile Co. has been incorporated under the laws of Virginia, with the object of manufacturing and selling horseless conveyances. The capital stock is £10,000.

**MOTOR-CARS ON THE CONTINENT.**

**Motor-Car Racing in Italy.**

WE learn from Italy that the Turin Automobile Club is organizing a race between Turin, Pignerol and Trana and back, a distance of about 56 miles, to be run off on the 30th inst. The race is divided into three sections:—  
(1) One-seated motor-cycles, (2) two-seated ditto, and (3) three and more seated motor-carriages. The "road-racing fever" has evidently reached Italy. We are glad that English laws prevent it spreading to England.

**Motor-Car Touring Congress.**

A SPECIAL committee of the Belgian Automobile Club has been appointed to make the necessary arrangements for an automobile meeting at Spa, when an international congress on automobile touring is to be held. The programme, so far as it has been arranged, comprises: July 2nd, a race of touring motor-cars from Brussels to Spa; July 3rd, opening of the Congress; July 4th, a race for speed cars; July 5th, second day of the Congress, also motor-vehicle manoeuvring competition; July 6th, an automobile fleuri, or promenade of motor-vehicles decorated with flowers; and July 7th, a motor-car excursion.

**A Motor-Car for Physicians.**

THE *Motorwagen* of Berlin, in its last issue to hand, illustrates a four-seated motor *vis-a-vis* for the use of country doctors, constructed by the Daimler Motoren Gesellschaft, of Cannstatt, Wurtemberg. The motor, which is of the Daimler 4-h.p. type, is located in the rear portion of the vehicle. The carriage is provided with a hood, and is stated to be capable of mounting gradients of 15 per cent.

**Steam Omnibus Service at St. Etienne.**

IN our issue of the 17th ult. we referred to the formation of a company at St. Etienne, France, with the title La Compagnie Stéphanoise de Traction Automobile. We now learn that the Company is about to start a service of steam omnibuses in the St. Etienne district, and that it has placed an order with Messrs. De Dion, Bouton & Co., of Puteaux, for five vehicles. This Company has a much better showing than the London Steam Omnibus Co., who, after many months' existence, are apparently making no headway with steam vehicles.

**"Record"-Breaking in France.**

MOTOR-CAR records have been very much to the front in French motor-car circles for some time past. The battle has hitherto been waged amongst electrical *chauffeurs*, but now war has been declared in the *petrole* camp, M. Lemaître having announced his intention of shortly endeavouring to create the kilometre record for petroleum-spirit motor-vehicles. We wonder whether the 18-h.p. Peugeot car will be used for the purpose or whether a new vehicle will be built.

**Wheels for Motor-Vehicles.**

THE question of wheels for motor-cars continues to attract considerable attention as well in France as in this country. In their current advertisement La Carrosserie Automobile Vinet, of 35 Rue Brunel, Paris, give a long list of motor-car builders who have *exclusively* adopted the Vinet wheel, among which we notice the name of the Daimler Motor Co. We were rather astonished to find that this firm went to France for the wheels of their cars, and do not for one moment believe that this is the case.

### The Soudan Motor-Cars.

M. FELIX DUBOIS, who some time ago took out a couple of De Dietrich motor-vehicles to the Soudan, is back again in Paris. The Governor of the French Soudan, General de Trentinian, is preparing a report on the trials of the vehicles which is expected to be shortly submitted to the French Minister of the Colonies. The publication of the report is being awaited with interest in France, and it will doubtless also prove interesting to Englishmen and their Colonial brethren.

### Motor-Car Races in Paris.

UNDER the new regulations which will shortly come into force in France, the speeds of motor-vehicles, both in towns and rural districts, will be regulated within certain limits, and it will then become necessary to obtain official sanction before it will be possible to conduct road races. The Union Vélocipédique de la Prefecture de la Seine has, however, a new idea for contributing to the feverish madness of the French nation for high-speed motor-car races in the neighbourhood of Paris. The idea is to utilise, if possible, the Longchamps race-course, hitherto sacred to the horse and occasionally to a hippomobile vehicle. With this end in view the Union has sought permission of the Paris Municipal Council to hold a motor-car race on this course early next month, and, extraordinary to relate, the Council, on the motion of Monsieur Max Vincent, has given the necessary permission, and the race is fixed to come off on May 7th next. We wonder how many years will elapse before Kempton Park race-course, or those of Sandown and Goodwood, are utilised for such a purpose.

### An Unlucky Road.

THE road from Frejus to Cannes is often reputed to be the most unlucky road in France. Almost daily it is the scene of disaster, bicycles, horse-drawn vehicles and motor-cars being equally unlucky on this road of evil repute. Last week, in one day, two accidents were reported within a very few minutes of each other. In the first a motor-car collided with a horse-drawn vehicle which a lady was driving. She was thrown out on to the road and severely injured. Only a few minutes had elapsed, and within a few yards of the same spot another motor-car collided also with a horse-drawn carriage which contained three people. On this occasion, fortunately, nobody was very seriously injured, although bruises and contusions were plentiful. The carriages in both cases were materially damaged.

### Motor-Cycle Race at the Parc des Princes.

THE result of this race, which was over a distance of 20 kilometres, was that Barras was the winner, Vasseur being second, and Rigal third, neither Griet nor Beconnais being placed. The winner's time was 21 mins. 57 $\frac{3}{5}$  secs. Previous to this contest, three electrical tandems were pacing the competitors in a cycle race, and the change when these went off the track and the motor-tricycles appeared was extraordinary, the silence of the one type being emphasised by the noise of the other. An amusing feature of the contest was the dresses worn by the various competitors, freedom being allowed in this particular. Barras wore a silk cap, Griet a woollen bonnet, Rigal and Beconnais hideous jockey caps, whilst the other competitors' head-gear was much more noticeable by reason of its variety than by its beauty. The audience being in waiting, the competitors lined themselves up in front of the starter, and it was then noticed that Jacquelin was not amongst the starters, although he had entered. As soon as they were fairly on their way Barras immediately rushed off with the lead, easily outstripping the remaining competitors. Rigal ran next, but Barras overlapped him before three turns were made. The speed was

something frightful, and it was lucky that no accident occurred, or the disaster would have been fearful.

### Concluding the Nice Carnival.

THANKS to Monsieur Albert Gautier, the automobilists taking part in the Nice races had an agreeable day's rest on the 27th ult., for Monsieur Gautier, who is the leader of automobilism on the Côte d'Azur, invited the *chauffeurs* to a banquet at his splendid villa at Cimiez, quite close to that occupied by Her Majesty the Queen of England. Amongst the numerous guests were Baron de Zuylen, the Count Biscarelli, Count di Ruffia (president of the Automobile Club of Italy), Monsieur Jacques Gondom (president of the Automobile Club of Nice), Monsieur Paul Meyan, Baron de Dietrich, Prince Lubecki, and many other well-known men in automobile circles on the Continent. Monsieur Gautier made a thoroughly humorous speech, as he generally does on such occasions, and alluded to the wonderful improvements and advances in automobile road carriages, and further remarked upon the tremendous increase of speed which it was possible to obtain on these vehicles, and which apparently was being increased day by day with no present indication of its having reached the limit.

### A Belgian Solution of the Voiturette Problem.

AN Antwerp firm—M. Pitteville, of Rue de Scorpion—who have lately taken up the construction of motor-tricycles fitted with the "Aster" petroleum-spirit motor exhibited a drawing at the Liège Cycle and Motor-Car Exhibition of a new light motor-voiturette they are about to put on the market. The vehicle, which has a very graceful appearance, will be fitted with an "Aster" motor. The "body" of the vehicle is suspended on the frame by scroll springs. The weight complete is stated to be about 4 cwt., and the cost from £100 to £120.

### A Belgian Motor-Car Parade.

AFTER the close of the recent Cycle and Motor-Car Exhibition in Brussels a parade before the rooms of the Belgian Automobile Club of the motor-cars exhibited was organized. Owing to the bad weather, however, only three vehicles—two Henriod cars and the Koch heavy-oil-car—put in an appearance, the *chauffeurs* in charge afterwards going for a run to Forest.

### The Pieper Car: A Distinct Novelty.

AT the Cycle and Motor-Car Exhibition at Liège, which closed on Monday last, a novel form of motor-carriage was exhibited by the Société des Établissements Pieper, of that city, which we hope to fully illustrate and describe in a subsequent issue. In the meantime we may state that the novelty of the vehicle, which is a two-seated carriage, consists in it being provided with both a petroleum-spirit motor and an electro-motor, with a battery of accumulators. The petroleum-motor is located in the front portion of the vehicle, and is connected to the electro-motor by means of a flexible shaft. From the brief particulars at our disposal at the moment, it is not possible to fully describe the action of the combination, but it would appear that to put the vehicle in motion the electro-motor is first started, taking current from the accumulators; the electro-motor, by means of the flexible shaft, thus putting the petroleum-spirit engine in motion, consequently obviating any necessity of pulling round the fly-wheel or turning a handle. When the petroleum-motor is in action the accumulators are switched out, while on level roads or down-hill runs, when the full power of the motor is not required for propulsion purposes, the supply of explosive mixture is not varied, but the change-speed handle is put on

low-speed, the excess of power being utilized to re-charge the accumulators. In addition to the starting of the petroleum engine by means of the electro-motor, another advantage is claimed for the combination in that, should the supply of petroleum-spirit run out, the two motors—petroleum and electric—may be disconnected, and the accumulators (which have a 25-mile capacity) switched in, and thus the run can be continued without having to search for an oil store. We are sure that our readers, like ourselves, will await further particulars of the Pieper car with interest.

#### Another Belgian Solution of the Voiturette Problem.

WE have received a rough drawing, which unfortunately does not lend itself for reproduction of the new two-seated light motor-voiturette which is being put on the market by the Fabrique Nationale d'Armes de Guerre, of Herstal near Liège, Belgium.

The vehicle has a very neat and comfortable appearance, the frame and body being supported on the axles by strong plate springs. The motor, which is located in the front of the vehicle, is of the vertical twin-cylinder petroleum-spirit type; it is stated to develop 3 h.p., and weighs about 1 cwt.; electric ignition is employed, while for cooling purposes the cylinders are furnished with *ailettes* or radial discs. The power of the motor is transmitted by belts to an intermediary shaft, and from the latter to the rear road-wheel axle by the usual sprocket wheels and chains. The variable speed-gear is controlled by a single handle mounted on the steering standard. The vehicle complete weighs from 4 to 5 cwt., according to the carriage-builder's work desired. The Fabrique Nationale is also, we learn, engaged on the designs of a new four-seated vehicle provided with a 6-h.p. motor. We hope to illustrate both types in an early issue.

#### The Paris Electric Cab.

PARIS has been in some excitement over the advent of the long-promised electric cab on its streets. In some measure the expectations and anxious anticipations have been fulfilled, but unfortunately have not given complete

satisfaction. During the fine and mild days following Easter everybody was on the look-out for one of these electro-mobiles. To their great sorrow, however, exceeding many have had to put up with disappointment, owing to the fact that the French Electric Cab Company only placed some twenty vehicles on the streets for hire. This number divided amongst two and three-quarter millions of people, a large proportion of whom are, according to Parisian custom, cab hirers, did not go very far. It is evident that at the present moment the Parisian *cochers* are not yet to lose their livelihood owing to the competition of the new-born *chauffeurs*.

#### Pau-Bayonne-Pau Race.

THE whole of the Parisian *chauffeurs* who visited Nice last month did not come back directly to Paris, on their return making a tour. For this reason the Automobile Club, Bearnais, organized a match which took place on

Wednesday, the course being between Pau and Bayonne, and a return to Pau, a distance of 206 kilometres. The race was largely subsidised, and prizes to the value of 5,000 francs were awarded; in addition the Michelin firm added a special prize of 600 francs which was restricted to those competitors who made use of the Michelin tires. The roads were said to be in good condition, and very high speeds were probably obtained, as the itinerary is rather level. Monsieur Lemaitre, who three times defeated Monsieur Giraud at Nice, was looked upon as the winner. The competition was extended to several classes of vehicles. The competitors were as follows: Class A (motor-tricycles)—Rigal, Béconnais, Vasseur, Pinaud, Magendie, Marcellin, Wuillaume, Bertin, Ducom, Plocque, F. Favier, Demester, Janet, Joyeux. Class B

(motor-tricycles, amateurs)—Debacker, Géo, Labadie, Cuzac, Couderc, Dumoulin. Class C (voiturettes)—Noé Boyer, Merle. Class D (two-seated cars)—Leys, Giraud, Albert Lemaitre. Class E (four-seated cars)—Renouilh, de Gallifet, Barbereau-Bergeon. Class F (six-seated cars)—Cascault, Menjou, Lafitte.

#### More Accidents at Nice.

UNFORTUNATELY the continuity of accidents with motor-cars at Nice still exists, a most serious example occurring during the present week on the Promenade des Anglais. A *chauffeur* driving a motor-car was proceeding from Magnon Bridge to the Promenade Wharf when he tried to pass a four-horsed coach whilst passing the front of the Elysée Hotel. Unfortunately, however, he collided with it, with the result that the car was overturned, the spirit took fire, and the car was at once in flames, together with the unfortunate rider also, whose clothes had become plentifully sprayed by the spirit forced out upon him. To add to the chapter of accidents, at this moment a motor-tricycle also came by, and deliberately ran into the overturned motor-car, and, gliding off it, also ran over the burning *chauffeur*. The motor-tricyclist was violently projected over the handle-bar of his machine, but fortunately escaped with comparatively slight injury. The bystanders, of course, rushed to the assistance of the burning *chauffeur*, every endeavour being made to put out the flames by means of rugs, etc.; unfortunately, however, their success was not sufficiently speedy to save the *chauffeur* from extremely serious injuries. Another accident occurred on Tuesday, at three o'clock, on the Hill of Ville d'Avray. A motor-tricycle and a motor-voiturette, in the latter of which two ladies were riding, were proceeding at a high speed on the hill, when a company of non-commissioned officers of artillery was met proceeding in an opposite direction. Unfortunately one of the officer's horses shied, with the result that the voiturette was unable to avoid the horse, and crashed violently into it. The shock, of course, was severe, and the horse fell backwards on its rider, who received extremely serious injuries to his legs and arms; the horse had two legs broken, and was ultimately removed in an artillery wagon. The ladies in the voiturette had a most marvellous escape; they were both projected out of their vehicle, but fortunately fell on thick grass, and sustained practically no injury. The voiturette, too, most curiously escaped without injury, and the ladies remounted their vehicle and proceeded on their way to Versailles, their original destination.

#### Fool-hardiness and Accidents.

ANOTHER serious accident has been reported to have occurred on Tuesday evening, at Villeneuve (Yonne). It appears that Monsieur Devoir, a physician, bought, a few days ago, a motor-car of 6 h.p. He, together with the driver of the firm who sold the vehicle and his own coachman, together with a mechanical engineer named Dechambre, went out on a trial trip with a view of instructing the coachman in the management of the vehicle. As is so frequently the case in France, the professional *chauffeur* entrusted the driving and steering to the coachman; as is also frequently the case with novices, the coachman desired to proceed at a much greater rate of speed than was conducive to safety in view of the fact that the control of the car was in the hands of an inexperienced person. The *chauffeur* several times desired to take over the control of the car, especially in view of the fact that the gradients of the road traversed were very severe, and that in addition the road was constructed on the brink of a precipice. The stubborn coachman, however, persisted in a refusal, and continued to drive at a speed of quite thirty miles an hour down a gradient of 1 in 14. The irregularity of his steering frequently brought him perilously near the edge of the

precipice, and on one occasion, in order to avoid the danger, he turned in the reverse direction too quickly, with the result that the vehicle collided with the pathway embankment and was immediately overturned, the whole of the riders being violently thrown out. It is reported that both the physician and Monsieur Dechambre are very seriously injured, whilst the coachman who caused the accident escaped with only a few bruises. The motor-vehicle was entirely wrecked by the violence of the shock and the subsequent overturning.

#### A Curious Accident.

A VERY peculiar motor-car accident occurred on Tuesday in front of the School of Arboriculture at St. Mande, a Parisian suburb. The driver was investigating the cause of a sudden stoppage of his vehicle, when without warning the carriage became completely enveloped in flames, the passengers only dismounting with considerable difficulty, and after suffering from scorching and burns. The driver fortunately found a public pump close at hand, and, placing the front of the vehicle under the pump's mouth, gave the lever four or five vigorous strokes in the hopes of putting out the flames; his efforts, however, were not successful for some short period. The accident arose owing to the spirit leaking into the pipe which supplied air to the explosion chamber of the cylinder. It is reported that this occurred owing to the heavy descent which the car was negotiating at the time. The car, of course, had to be removed by the aid of horses, and the *chauffeur's* disgust at steering his car whilst it was being drawn by the led horses, was manifest to all who chanced to meet the unhappy individual.

#### The Fourth Anniversary of the Long-Distance Motor-Tricycle Races.

THE fourth annual occurrence of the long-distance trials has taken place over the Paris-Roubaix course. The competition this year was a particularly brilliant one, as no fewer than fifty-seven competitors fought for victory. The start took place at nine o'clock in the morning, and the fifty-seven competitors at once rushed forward, amidst a perfectly deafening noise, enveloped in an impenetrable cloud of dust. The distance was 268 kilometres, and this was covered by the winner, Monsieur Osmont, in 5 hours 35 min. 30 sec. This is at the rate of 48 kilometres per hour. The following are the first twenty-seven competitors—it will be seen that the twenty-seventh man took 10 hours 59 min. to complete the journey, or within a few minutes of double the time occupied by Osmont:—

- |                                |                              |
|--------------------------------|------------------------------|
| 1. Osmont, 5 h. 35 m. 30 s.    | 15. Son, 7 h. 30 m.          |
| 2. Béconnais, 5 h. 45 m. 15 s. | 16. Lamon, 7 h. 35 m.        |
| 3. Girardot, 6 h. 2 m.         | 17. Nicolas, 7 h. 38 m.      |
| 4. Vasseur, 6 h. 9 m. 10 s.    | 18. Griet, 7 h. 46 m.        |
| 5. Caron, 6 h. 24 m. 30 s.     | 19. Weidenfeller, 7 h. 48 m. |
| 6. Rolland, 6 h. 31 m.         | 20. Renoire, 7 h. 55 m.      |
| 7. Baras, 6 h. 36 m. 45 s.     | 21. Christophe, 8 h. 21 m.   |
| 8. Hugues, 6 h. 54 m.          | 22. Lopard, 8 h. 24 m.       |
| 9. Echalie, 6 h. 57 m.         | 23. Gardon, 9 h. 2 m.        |
| 10. Prince, 7 h. 2 m.          | 24. Courbe, 9 h. 8 m.        |
| 11. Oury, 7 h. 3 m.            | 25. Tisci, 9 h. 50 m.        |
| 12. Lepoutre, 7 h. 20 m.       | 26. Quantin, 10 h. 34 m.     |
| 13. Bar, 7 h. 24 m.            | 27. Chenard, 10 h. 59 m.     |
| 14. Ducom, 7 h. 25 m.          |                              |

#### The Alcohol Competition.

DURING next week experiments will be carried out in Paris to ascertain decisively the results to be obtained by the use of alcohol motors on motor-vehicles. Although chemists and others interested in the production of alcohol have taken considerable interest in the matter, the French constructors of motor-cars apparently do not feel the same amount of interest. This may, of course, arise owing to the difficulties inherent to the production of a workable motor driven by alcohol, from a commercial point of view. The first trial takes place on Tuesday, the 11th inst., and the following constructors have entered:—De Dietrich (one

vehicle), Société "La Jeanne d'Arc" (one vehicle), the Henriod Co. (three vehicles), Noé Boyer & Co. (two vehicles), and Guttia & Co. (one vehicle). There are thus eight vehicles entered, but probably all will not start. The competitors have to meet at 10 o'clock in the morning, the start taking place at 10.30. The route selected is Paris, Chantilly and Paris. The main object of the competition is to ascertain whether a vehicle propelled by a motor actuated by alcohol can travel so long a distance as the same vehicle would traverse with a motor of similar power actuated by petroleum-spirit; incidentally, endeavours will also be made to ascertain what proportion of air is necessary to secure the best results, and also to enquire whether the ordinary form of carburettor such as is used with petroleum-spirit is also suitable for use with alcohol. If the competition is managed by competent engineers, any information towards the solution of these problems will be welcomed.

#### The Third Competition of Motor-Tricycles.

THE third annual competition over a hundred kilometres for motor-tricycles will be run off on April 18th, between Etampes, Chartres and Ablis. The entrance fee is twenty francs, and the four first prizes are as follows: One thousand francs, five hundred francs, three hundred francs, two hundred francs. The competitors will have the service of signalmen at all risky crossings, a green flag signifying that it is considered advisable that speed should be slackened, and a red one being displayed when a stop is considered imperative. Competitors will not, however, be compelled to regard these signals; they are given in the riders' interest, but obedience is not compulsory. Thirteen competitors have already entered; these are as follows:—1, Léon Bollée; 2, Jamin; 3, Ajax; 4, Bardin; 5, Teste; 6, Osmont; 7, Et. Giraud; 8, Rigal; 9, Béconnais; 10, Léonce Girardot; 11, Vasseur; 12, Sphinx; 13, Louis Piétri. It will be remembered that Monsieur Leon Bollée won the last year's competition with an 8-h.p. machine, but at such a terrific speed as would appear to place the rider's life in serious peril. We wonder who will be the next to imperil his life in this dangerous competition.

#### A Motor-Car Museum.

THE Committee entrusted by the French Automobile Club have had the idea for some time past of forming a historical exhibition of ancient motor-vehicles. In this connection it has approached Colonel Laussedat, the Director of the Conservatoire des Arts et Métiers, and has received a sympathetic reply, assuring the Committee of his assistance. He incidentally mentions that the progress of automobilism in France under the ægis of the Club represented by the Committee naturally compelled him to give his support, and in regard to the only example of mechanically-propelled road-carriage in the Museum under his direction—Cugnot's—expresses his readiness to place it and the records concerning it at the disposal of the Committee for their investigations.

#### A New French Solution of the Voiturette Problem.

WE referred at some length in our last issue to the demand for a "voiturette" or light carriage whose motor must not necessarily be started by pedals, and whose cost should range from £100 to £140. *La Locomotion Automobile* in its last issue to hand illustrates a new vehicle known as the "Victoria Combination," which has just been put on the market by La Société des Voitures Automobiles La Parisienne, of 71 Avenue de la Grande Armée, Paris, as an attempt to meet the demand above alluded to. The vehicle is a result of the combination of a motor-tricycle and trailing-car. The motor—a 1½-h.p. De Dion—is mounted, together with the transmission mechanism,

on a front pair of cycle wheels, thus forming an *avant-train*. Behind this is a trailing-car, the frame of which is mounted on the front pair of wheels by means of a "head" on the lines of that adopted in cycle construction. A long steering-handle is provided, on the end of which are fitted the small levers controlling the electrical ignition and the mixing valves. The vehicle, which apparently is only intended to carry one person, is stated to cost but very little more than a motor-tricycle with trailing-car. We hope to give an illustration of it in an early issue, but apparently the motor will prove the stumbling-block, as it does not appear that it will be sufficiently powerful to meet the demands of either French or English riders for speed.

## CORRESPONDENCE.

### THE SPEED OF THE MORS CAR VERSUS THAT OF MR. WRIDGWAY'S TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sorry to have to refer again to the same matter, but I certainly must object to the way in which Mr. Wridgway "writes up" his motor-tricycle, which should be publicly known as a French machine built from start to finish in France, and not, as falsely stated, built somewhere in Coventry. On neither of the two occasions to which he refers was there the slightest idea of an impromptu race between my Mors car and your correspondent's tricycle.

In the first instance it was a friendly match between Mr. S. F. Edge's Panhard car and my Mors car, in which I easily won, gaining over 30 seconds to the mile. I did not even know your correspondent then, nor had I ever met him before.

The second time I met him just outside Liverpool, at Widnes, on the day of the trial run, where I stopped for a broken chain. Your correspondent arrived there long after me, pedalling hard, his tricycle *hors de combat*, the electric current being short-circuited. Although he stated recently in a letter to one of your contemporaries that even on the day of the big gale in Liverpool "his induction coil, being wrapped up with a piece of rubber, gave him absolutely every satisfaction," yet he had to stop there for about an hour before he could dry his electric ignition device and start again. Later on, on the return journey, he, being unable to proceed during the gale, had taken shelter with another tricyclist (who fully corroborates my observations on this date), and took advantage of the passing Mors to "hang on," as he chooses to call it, that is to say, to be dragged by the vacuum naturally created by a car of this size, and so to spoil incidentally the tail-board of my car. At the entrance of the town, however, where it was necessary for me to slacken my pace in view of the traffic, your correspondent left the (until then so welcome) shelter of my car, only showing his nerve (?) afterwards in calling this an impromptu race, and stating that he arrived a quarter of an hour before me, forgetting, of course, to mention that he left the starting point (Widnes) fully an hour before I did.

So much for your correspondent and the value of his statements.

Yours faithfully,

March 29th, 1899.

ED. E. LEHWESS.

### ANOTHER PENNINGTON CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Edge admits his connection and interest in the Paris Singer, the Aerial, and the Dunlop-Dion Motor Companies, which shows that we were right in our conjecture that he should not pose or be treated as an impartial contributor on motor matters. Some of the concerns he admits being connected with profess to be under licence from the British Motor Company. We presume, therefore, we were right in inferring that he is also—at least indirectly—interested with Mr. Lawson or the British Motor Company.

As Mr. Edge has the motor industry so much at heart, we should like to test his sincerity by matching our 110-guinea single-cylinder car against any other single-cylinder four-wheeled car of the same diameter cylinder, the product of any of the above companies or of the British Motor Company; or, failing all these, any other car he may be able to furnish which is marketed at anything under 150 guineas. Both cars to carry two passengers of equal weight side by side, and the distance to be from Aberdeen to London—about 500 miles. *Moreover, we will handicap our car to arrive in London before the competing car arrives at Northampton.*

To make the conditions absolutely fair, and to show that our cars are the simplest and offer no difficulty in their management, we would stipulate that the competing cars use the same oils, both for running and lubricating, and that the driver in each case shall have never even ridden on one.

Further, in order that there may be an opportunity of testing the merits of the Aerial-Patent-Dunlop-Dion-British-motor-tricycle, "made entirely in England," we would like to match one of our steel cylinder motor-tricycles of equal diameter cylinder and of equal gear for a hill-climbing contest, without the use of pedals, the weight of drivers to be the same, with a minimum of sixteen stone.

We would wish the amount of oil consumed in both cases and of the water for cooling purposes evaporated on the cars to be carefully noted, in order to show the vast superiority of our cars over all others in economy of fuel and the small amount of water required for cooling purposes.

Yours faithfully,

London, April 4th, 1899.

PENNINGTON & BAINES.

### THE SPEED OF MR. WRIDGWAY'S TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time back Mr. Wridgway's statements as to the speed he could make on his motor-tricycle were questioned, but his Easter Monday performance at the Crystal Palace track when he beat the French kilometre record-holder, Mons. Rigal, and covered over twenty-nine miles in the hour is a very conclusive refutation to the persons who questioned Mr. Wridgway's word. This performance for a motor-tricycle on a track would be equal to about thirty-five miles an hour on a "straight away." The vast concourse of people who flocked to this meeting is strong testimony of the interest taken in motor races in England, and we hope to see considerable developments in this line, especially as the law prohibits fast speeds on the highway.

Yours faithfully,

London, April 4th, 1899.

PENNINGTON & BAINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I venture to call your attention to what seems to be a mistake in your Journal (p. 50) of the 31st ult.

The article, speaking of the "Bollée" voiturette, says: "This has been discredited in both France and England because some 'know-all' thought it wise to place an exhaust valve on top of instead of underneath the motor." I am in no way interested in the "Bollée" beyond having been the owner of one (a Paris-built one) for over two years, and in my machine and in all the machines I have seen the exhaust valve is immediately under the cylinder. It is true that the spindle and spring of the air-inlet valve are in a small plated box above the cylinder, the cover of this box being perforated with holes presumably to keep the spring and spindle cool, as no appreciable amount of air can be drawn in by this road, the spindle working closely in a tube. The air-inlet is below and on the inner side of cylinder.

I have never had the slightest hitch with the valves themselves, and my machine has had plenty of use. The only trouble has been with two small rivets connected with the driving pulley, which have given way with me twice owing to the parts being so closely packed together as not to

leave room for good heads on the rivets; but I trust I have now overcome this fault by using screw rivets.

The cooling of the cylinder, as your article points out, is certainly the problem. The iron flukes, to my mind (adding so much to the mass of the metal in the cylinder), rather serve to retain the heat, and the cylinder would cool as soon without them. I have managed the cooling perfectly by allowing cold water to leak slowly over the cylinder while running, but this means stopping every twelve or fifteen miles to fill up one's tank with water. If the road be good, I do not know her equal at climbing impossible looking hills. The great faults of the machine, in my experience, are (1) that the working parts are just a trifle too light perhaps, and (2) the difficulty of getting at the interior machinery without dismantling the whole car.\*

Yours truly,  
C. R. H.

### "THE FASTEST CAR IN THE COUNTRY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice that repeated reference has been made in your columns to the Mors challenge. Will you permit us to explain in a few words to your readers our position in this matter. On February 18th we issued a challenge stating that the Mors was the fastest car on the road in this country, and on the 25th of the same month Messrs. Pennington and Baines replied with the proposition for a hill-climbing contest, going up and down a certain hill a hundred times. As we were and are absolutely determined not to give Mr. Pennington the slightest chance to back out as he has done on previous occasions, we expressed our willingness to enter even this absurd contest, making only the condition that the engine on the respective cars should not be stopped during the whole of the contest, foreseeing that the water circulation in Mr. Pennington's engine would be in no way effective. This condition did not allow him to cool his motor, but it sufficed to cool his ardour for the proposed contest, and we heard no more about it. Then he came out with the proposed run of 500 miles in France, and we hope sincerely that this trial will come off; and, at least so far as we are concerned, we shall endeavour to see that Mr. Pennington does not let this opportunity slip as he has done with his previous challenges which he issued to the world some time ago when he brought his first machine on the English market. *We are willing to enter either one or five carriages, a racer or an ordinary touring car, just as Mr. Pennington may wish.*

We should like to use this opportunity to correct a logical error of your Scotch correspondent, "Brown Heather," who finds that in Scotland there are people who object to a two-cylinder Pennington car racing a four-cylinder Mors. We fail to see how the number of the cylinders can be taken as a criterion of the actual power of the car; so, to satisfy your correspondent, we should have matched the new 10-h.p. two-cylinder Mors car against Mr. Pennington's two-cylinder car with even a better chance of our winning, but we selected our ordinary four-seated dog-cart for the reason that many cars of this type are daily used by motor-carists all over the kingdom, whilst Mr. Pennington's car has yet to give proof of its commercial value, and would therefore gain a magnificent advertisement, if it proved its potential value, by beating the fastest cars in England—the Mors.

THE AUTOMOBILE ASSOCIATION, LTD.

Princes Road, Holland Park Avenue,  
London, W., April 5th, 1899.

OWING to the increasing demand for capable drivers of motor-vehicles in Vienna, there is a talk of establishing a training school in the Austrian capital.

A FRANKFORT-AM-MAIN correspondent informs us that motor-cars are steadily gaining in popularity in that town, there now being over fifty vehicles in use in the district.

\* We answer our Correspondent in another column.

## THE NEW MORS VERTICAL PETROLEUM-SPIRIT MOTOR.

—8—

IN our issue of March 10th last we gave an illustrated description of the new two-seated carriage fitted with a 4-h.p. motor, comprising two cylinders set at an angle to each other, constructed by the Société d'Electricité et d'Automobiles Mors, of 48 Rue du Théâtre, Grenelle, France, the larger vehicles of this Company being, as is already well known, provided with a 4-cylinder 6-h.p. motor. We now learn that the Mors Co. is constructing still a further type of motor for more powerful vehicles, of which we are herewith able to present several illustrations, together with a description. The new motor is of the vertical twin-cylinder type, and is capable of working up to 8 h.p. Referring to the illustrations, Fig. 1 is a sectional elevation, Fig. 2 a cross section through one of the cylinders, Fig. 3 a plan, Fig. 4 a view of the admission valve gear, Figs. 5 and 6 are sections of the exhaust valve control gear, and Fig. 7 a detail view of the gear controlling the electric ignition. The motor works on the ordinary Otto cycle, the two piston rods *a a* (Fig. 1) working on to the same crank *b* on the crank shaft *B*, the crank *b* for balancing purposes being provided with counterweights *b<sup>3</sup>*. The admission and exhaust valves *C D* in each cylinder are arranged one above the other (Fig. 2), so that they may be readily accessible. The exhaust valve and the cylinder walls, to the extent of the stroke of the piston, are water-jacketed for cooling purposes.

FIGS. 1 AND 2.—SECTIONAL ELEVATIONS OF MOTOR.

A feature of the new motor is the cam gear controlling the opening of the exhaust valves. The motor shaft *B* (Figs. 1 and 2) is connected by reducing spur wheels *b<sup>1</sup> b<sup>2</sup>* to a gear wheel *c* keyed on a hollow shaft *E* running above and parallel to the motor shaft the whole length of the motor. On the hollow shaft *E* (Fig. 5) slides a bush *f* of a centrifugal governor, the balls *F F* of which are placed in openings in the wheel *c*. The bush *f* is keyed on the shaft *E* in such a way that while it rotates with it it is free to slide along the shaft. The two balls of the governor are connected to arms *f<sup>1</sup>* which in turn are connected to a rod *f<sup>2</sup>* which passes through the hollow shaft *E* and through a special piece *f<sup>3</sup>* fixed, but free to slide backwards and forwards in the hollow shaft. This piece *f<sup>3</sup>* is carried on one end of a rod *f<sup>4</sup>* the other end of which is free to slide through a plug-nut *G*. The bush *f* acts as one half of a small friction clutch, and when moved forward grips the other half of the clutch formed solid with a second tubular shaft *H* surrounding the shaft *E* (Fig. 5). It is on the shaft

*H* that the cams controlling the exhaust valves and the electrical ignition are mounted. The exhaust valves are opened by these cams in the usual way by means of the valve rods, on the end of which are rollers in continuous contact with the cams (Fig. 2); the ignition-control device is shown in Fig. 7. Coming now to the action of the governor on the cam-driving gear, a spring *g* is provided on the rod *f*<sup>4</sup> (Fig. 5),

this spring maintaining the bush or clutch *f* in contact with the other half of the clutch on the shaft *H*, thus driving the latter and the cams mounted on it so long as the speed of the motor does not exceed the normal. When the speed becomes excessive, the balls *FF* of the

governor fly open, causing the bush *f* to move backwards against the spring *g*, and consequently breaking the connection between the shafts *E* and *H*. In this way, the cams fail to act on the exhaust valve stems until the speed has once more attained the normal, when the bush *f* again returns

into contact with the shaft *H*. The advantage claimed for the new device is that instead of allowing the cams to continue rotating and stopping their action on the exhaust valves by other means when the speed of the motor becomes excessive, the cams themselves are thrown out of action, and at the same time the electrical ignition device is put out of gear, so economizing current. The special cam gear is only intended to maintain the speed of the motor at a rate previously decided upon, any change in the normal speed being controlled in the usual way by varying the quantity of the explosive mixture. To effect the latter, a special form of

obturator is introduced in the admission pipe, by means of which the quantity of explosive mixture admitted can be varied. These obturators consist of a thin plate sliding transversely in the admission pipes, and so adjusted that the

joint is air-tight. These thin plates are provided with two openings of a shape equal to the section of the admission tube, also a triangular-shaped part *j*<sup>1</sup> (Fig. 4). The displacement of these admission-regulating plates is effected by means of a small pinion *L*, gearing with a rack formed on the end of the plates *J*. It will be seen that according to the position of the plates in the admission tubes the quantity of explosive mixture allowed to pass can be varied from zero up to the maximum capacity of the tube. The advantage claimed for this device is that the carburettor is not interfered with in any way, and that consequently the hydro-carbon formed is utilised to the maximum degree.

The whole of the cam shaft and its controlling gear are enclosed in the oil-containing case *M*, in which the crank shaft works, a small removable cover being provided at *m* (Fig. 1), so that the various parts may be readily accessible. Fig. 8 gives a diagrammatic view of one of the latest Mors four-seated phætons, which is to be shortly imported into this country by the Automobile Association, of Holland Park Avenue, W., the agents for the Mors Co. in the United Kingdom. The motor employed in this vehicle is capable of developing up to 10 h.p.

## THE ELECTRIC MOTOR-VEHICLE.\*

BY C. E. WOODS.

FOLLOWING a very complete and interesting introduction giving the defence for the name "motor-vehicle" and the various types of vehicles manufactured, as well as the present status of the art abroad, the author makes the remarkable statement that twenty thousand carriage makers are required to-day to fill the market demand for vehicles in the United States as required for road and street transportation. A little over 30 per cent. of the total animal power used in this transportation is required in the cultivation of the soil to obtain fuel for this power and to transport such means of maintenance and stable refuse from point to point. This means, broadly speaking, that animal power has in itself but about 70 per cent. efficiency in its application. Further, horse power cannot be worked at a greater average than about five hours or twenty miles per day, which as compared with mechanical applications of any form puts such power into a very low figure of utility. Under such conditions of operation, this power unit has a depreciation of not less than 20 per cent. per annum, and from large users of horses in express companies, large liverys, etc., the depreciation has been given as about 33 per cent.—either of which figures is far in excess of any of our good mechanical or electrical propositions of the day.

These startling facts and figures bring us very close to an understanding of the possibilities in the motor-vehicle as an industrial feature, and we cannot under such circumstances deny the brilliant outlook it has for the future. The sanitary conditions attendant to its use, its lesser cost of maintenance, its greater mileage capacity, its more rapid transit, its lesser space occupied in the stable and on the street, its freedom from expense when not in use, all put together eliminate entirely the objections which at first appear as to its greater initial cost. The possibility this vehicle opens up for road and street improvement and the low cost of maintenance of same should be items of great interest to municipalities, counties and States. Streets will have a capacity for double the amount of vehicles without any increased congestion, will be freed from the continual pecking of iron feet, which are the main causes of their rapid deterioration, and sewers will perform their functions without being continually clogged up with refuse matter.

But to come from speculation to reality. The greater first cost of these vehicles is a necessity which is very readily understood; as the vehicle part itself, for the first item, is necessarily more expensive for the reason that when it comes to carrying twice or three times the weight in the vehicle ordinarily carried to running it twice or three times as fast as the horse-drawn vehicle under exactly the same conditions of road and street, it means quite a different proposition in vehicle construction without reference to its electrical and mechanical features.

I remember in my first early experience the disappointments which arose in regard to weights, constructional features, controls, etc., and three years ago I thought it would never be possible to build a motor-vehicle with any mileage capacity at all at a less weight than 1,800 or 2,000 pounds, yet to-day I have vehicles in operation which weigh 800 pounds including everything, and have a mileage capacity of about 28 miles on one charge of the batteries. My work has also developed the fact that as great a range in different vehicles can be obtained as regards size, usefulness, etc., as in any of the prior lines of vehicles, and I have found that for a diversity of design covering nearly thirty different styles of vehicles, the whole proposition is confined to what I call four different sizes of equipments. By this I mean four different sizes of motors, batteries, and so forth, which are as follows:

My lightest vehicle is equipped with one 2½-h.p. motor,

36 batteries of sixteen ampère hours' capacity for two hours, which runs the vehicle at a speed of fourteen miles per hour, carrying two people. The weights in all the construction work of this vehicle have been reduced to a minimum, the total weight of the batteries being 440 pounds, about 360 pounds being in the motor and vehicle proper.

(To be concluded.)

## MOTOR-CAR v. CYCLE.

THE record was closed in Aberdeen Sheriff Court last week in an action by William Cromar, a plumber, residing at 39 St. Swithin Street, against William Harper, the manager in Scotland of the Benz Motor-Car Company, Aberdeen, in which £500 is claimed as damages for injuries sustained. Cromar states that on Saturday, August 6th last, he, in company with two other cyclists, went for a run along the North Dee-side Road, crossing the Dee at the Maryculter Bridge. The party called at the Mill Inn, at Maryculter, and on leaving the inn had their attention occupied by a showman who was extolling the virtues of a strength-testing machine in the vicinity of the inn. A large crowd had gathered, and the pursuer, along with his friends, stood on the fringe of the crowd on the left hand side of the road. Whilst standing there a motor-tricycle car, driven by Harper, came sweeping down the road, upsetting Cromar and inflicting a compound fracture of his left leg. His bicycle also shared its owner's fate, though to a greater extent, being made practically useless. The pursuer, in consequence of these injuries, was for a considerable time unable to attend to his business, and contends that the accident was caused by the negligence of the defender whilst driving at an excessive rate of speed—twenty miles an hour it is averred. On the other hand, defender denies all the allegations, and contends that, as Cromar was injured through no fault of his own, or of anyone for whom he was responsible, he is not entitled to compensation.

WE learn that the Kölner Electricitäts Gesellschaft (late Messrs. Louis Welter & Co.), of Cologne, are about to take up the construction of electric motor-vehicles. New works are being established for the purpose, and it is hoped to commence building carriages by July 1st next.

MOTOR-CYCLE and motor-car races are just now very much *en evidence* in France. On Sunday there was a race from Montpellier to Toulouse; on Monday one from Paris to Roubaix; yesterday one from Pau to Bayonne and back; while to-morrow there is one from Pau to Perigueux.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

\* Abstract of a paper read before the Chicago Elec. Assn.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, APRIL 14th, 1899.

[No. 6.

Published by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### Saturday Tours of Motor-Cars.

THE Saturday tours recently organized by Mr. Hewetson at the wish of many owners of Benz and other cars are proving a great success. For to-morrow a tour has been organized to Effingham, the route being via Putney Bridge, Wimbledon, Kingston Vale, Kingston and Leatherhead. Afternoon tea will be served at the Blucher Hotel, Effingham, at 5 o'clock, and the return journey to London will be made by the above route. The place of meeting is Dean Street, Oxford Street, and the time of starting 2 p.m. On Saturday in next week, the 22nd inst., a longer tour is proposed. It is suggested that the tour should embrace both Saturday and Sunday. Bedford has been selected for Saturday's destination, both luncheon and tea being served at the Swan Hotel. Here Mr. D. Albone, of Ivel wheel fame, will join the party, and it is proposed to journey to Biggleswade in the evening, night quarters being secured at the Ivel Hotel. The return to town will be accomplished on the 23rd inst. Mr. Hewetson desires us to state that the presence of all motor-carists will be welcomed on these tours, and that if time cannot be spared by those participating, they need not necessarily adhere to the programme in its entirety.

### The Payment of Tolls by Motor-Vehicles.

NUMEROUS complaints have reached us as to the extortionate charges made by various toll-gate keepers and ferry owners for the passage of motor-vehicles. The Gainsborough Rural Council have taken the law into their own hands so far as the charging of tolls for their steam-roller is concerned at one of these objectionable toll-gates at Haxey. They instructed the driver of the road-roller that in the event of the toll-gate keeper demanding tolls he was to refuse the charges demanded, and to run his steam-roller through the gates, and so break them down. This order the driver carried out exactly, and the toll-gate was of course demolished. Although it is legal to charge motor-vehicles a toll, yet it appears that it is illegal to charge motor-vehicles employed in carrying out road repairs, hence the action of the Gainsborough Council. We would not advise motor-car drivers to take a similar course, although the demands of toll-gate keepers are frequently extortionate enough to cause such a course being taken.

### Automobile Club's Next Meeting.

THE committee of the Automobile Club had originally decided to hold the April house dinner at the club-house on the 12th inst., but this arrangement has been varied in favour of a much more enjoyable programme. It was next intended that on Saturday, the 22nd inst., the Club should have an afternoon run to Virginia Water, and that subsequently the house dinner should be served at the Wheatsheaf Hotel. The start was timed to take place from the club-house at 2.15 p.m., the return to town being accomplished either on the Saturday night or on the Sunday

evening, at the discretion of the participants. We now learn, however, that the Automobile Club intend having an all-day run to Frensham and back on Saturday, the 22nd inst., and that the dinner at Virginia Water is abandoned. This programme is certainly a very good commencement of the Saturday and Sunday tours to be carried out during the summer months. Several enthusiastic automobilists have written to us suggesting that we should advocate organized Saturday, or Saturday and Sunday, tours, and amongst other places suggested for the Saturday destination Sevenoaks, Tunbridge Wells, Horsham, Dunstable, Oxford, Newbury, Farnham, Basingstoke, Liphook, Eastbourne, Robertsbridge, Ashford, Canterbury, Aylesbury, Cambridge, Marlow, Chichester, and Haslemere have been proposed. We think, however, that we cannot do better than advise automobilists to participate in the runs organized by the Automobile Club, as we do not think the time is yet ripe for several distinct week-end runs of this description.

### The Liverpool Self- Propelled Traffic Association.

To the great regret of everybody concerned, the meeting originally arranged as the last of the present session of the Liverpool Self-Propelled Traffic Association has fallen through, owing to the inability of Messrs. Simpson and Bodman to deliver the paper promised for this meeting. As a consequence there will be no further meeting of this Association until the trials in September next, the entries for which we are informed are already fairly numerous.

### London Electric Cabs and the "Taxameter."

It has been announced in the daily papers that on the reappearance of the London electric cabs on May 1st they will be found to be provided with the automatic fare register known as the "taxameter." We are informed by the chairman of the Company, Mr. Walter C. Bersey, that there is at present no intention of fitting these appliances to the Company's vehicles; although the Company fully recognise their value, they do not think the present moment is suitable for their introduction on the electric vehicles.

### Motor Cars in Royal Parks.

MR. BOWLES, who never seems happy unless he is grumbling at something, recently vented his spite against motor-vehicles by proposing in the House of Commons, that such vehicles should be excluded from Hyde Park and other Royal parks. He characterised these vehicles as "those abominations called motor-cars," and held that they were "calculated" to frighten horses. Mr. Labouchere turned the tables upon Mr. Bowles by saying that this gentleman was evidently a timid rider and wanted Rotten Row to be turned into a circus—that he might pull up his horse in case of its running away with him. Mr. Labouchere added that when he had his circus Mr. Bowles wanted to exclude motor-cars therefrom as a further guard against his timidity. Mr. Akers-Douglas replied in the spirit which was to have been expected. He expressed his inability to see how a

motor-car could be excluded from these parks when it was a private carriage, simply for the reason that it was propelled by electricity or other power instead of being drawn by a horse. He, however, granted that it might be necessary to formulate regulations as to the pace at which motor-vehicles would be permitted to travel in such places.

#### Success of the North of England Public Motor-Vehicle Service.

WE recently chronicled the founding of a motor-vehicle service in Sunderland, and we now learn that this has proved so eminently successful that the same syndicate are considering the advisability of introducing similar public motor-vehicles in other districts of the north-east coast. The services suggested include one between Sunderland and South Shields, and another between Tynemouth and Blyth, Northumberland. Independent syndicates are at work with a view to establish services in Newcastle and its vicinity.

#### The Motor-Car Exhibition at the Agricultural Hall.

FROM the fact that no advertisement appears in the present issue regarding the holding of the Exhibition of Motor-cars promoted by the proprietors of this Journal it might be considered that the project had dropped. This is, however, far from being the case, and the absence of the advertisement arises from pressure on our advertising space. There remains only a few feet unallotted on the ground floor of the Agricultural Hall, nearly every maker of repute in the country who is ready to exhibit having already booked space. A large number of continental manufacturers and agents have also secured stands, and there is, we are glad to say, every promise of this being the most successful, as well as the largest, exhibition ever held in this country.

#### The New Post Office Delivery Vans.

LONDONERS have during the present week had the pleasure of noticing a further use of motor-vehicles by the Postmaster-General in conveying mails from the Post Office to various railway stations and other centres of distribution. The vans are thoroughly businesslike vehicles, very greatly in advance of anything that has yet been used for such purposes in England, and we congratulate the manufacturers of the machinery, the Daimler Motor Co., Ltd., and the builders and designers of the bodies, Messrs. Mulliner, of London and Northampton, on the excellence of their joint production. The vehicles are propelled by twin Daimler motors of 8 n.h.p., or 11 h.p. actual. The usual practice of placing the engines under a "bonnet" in the front of the splash-board of the vehicle has been departed from, and the practice of Messrs. Panhard & Levassor in constructing their light omnibuses has been followed, the motors being placed in a box under the driver's seat. We regret to state that the vehicles have not been purchased by the Post Office—they, in fact, forming a part of the ordinary vehicles hired for mail transport. The Daimler Motor Co. are the contractors in the present instance, and the following is a part of the specification to which they had to adhere in furnishing the vehicles as required by the Postmaster-General. The floor space is nine feet long and five feet wide, the height of the interior of the van being six feet. It was insisted that three vehicles should be provided, although two only are designed to be used at any one time, the third serving as a stand-by in case of break-down or other accident. We understand that the weight specified by the Postmaster-General has caused some considerable difficulty to the constructors, and even now, so we hear, it has been impossible to get the weights within the limit laid down in the specification. We have heard rumours that the vehicles are running beyond the rate of speed permitted by the Board of Trade regulations for vehicles of their weight, but at the time of writing we have been unable to gain con-

firmation of this report. In addition to the ordinary supply tank for water, it has been thought advisable to fit these vehicles with tubular heat-radiating water-coolers. By this means the quantity of water otherwise necessary to cool the four cylinders of the engines has been considerably reduced, with a corresponding reduction in the dead-load of the vehicle itself. We understand the Postmaster-General is considering the possibility of employing additional motor-vehicles for other routes, and we are glad to notice that at last one department of the Government is paying attention to the advantages of motor-vehicles as compared with those drawn by horses.

#### Fire at an Electric Charging Station.

JUST before Easter the electric charging station which has been established by Mr. Robert at Fisherton Street, Salisbury, for the convenience of drivers of electric vehicles visiting that town was the scene of a slight fire. The conflagration broke out in the engine house, and the engine itself, which uses oil as a fuel, was speedily in flames. At one time it was feared that a large tank of petrol might explode, but by the aid of a speedy use of the high pressure water supply available the fire was subdued without any very serious damage resulting. The charging station is now in full swing again, so that vehicles using electricity either as a motive power or for igniting gaseous charges can have their accumulators re-charged at this convenient station.

#### Ancient Motor-Vehicles.

IN the current number of *Cassiers' Magazine* Mr. Alfred R. Sennett contributes an article on horseless-carriages of four hundred years ago. It is hardly necessary to say that these horseless-carriages were always manumotive vehicles. The article is embellished by seven reproductions of drawings made by the celebrated Albrecht Durer. The article is an interesting one, and discusses, not too technically, the gearing proposed to be used with these vehicles. It is a moot question, however, whether any of these vehicles were ever constructed, or, if they were constructed, whether they progressed by manual power. The vehicles are extremely ornate in design and in decoration, whilst to modern ideas the dresses of those supposed to be operating the vehicles are essentially unsuited to the task which is to be fulfilled. As a matter of historical research the article is entertaining, but from a practical point of view it has very little utility.

#### May Meeting of the Motor-Car Club.

WE are glad to notice that the Motor-car Club has, since its emancipation, emerged from the gloom with which its transactions were enveloped in the past. Under the guidance of Committee, ably aided by Mr. F. W. Bailey, the Hon. Secretary, a programme of some definite form and some considerable interest has been drawn up for fulfilment during the coming summer season. The first of the series of events will take place at the Crystal Palace on May 6th next, and we may remark incidentally that the Crystal Palace Company are enthusiastically supporting the motor-car movement. We are glad to notice that the Club is not encouraging road-racing, nor is it at present paying very much attention to track races. The contests at the Crystal Palace are designed to demonstrate the practical use and utility of motor-vehicles such as are generally supplied to the public, and not to demonstrate that it is possible to build a monstrosity which is capable of moving at a rate far beyond that desirable on ordinary common roads, as has so frequently been done in France. In order to secure these aims, only ordinary vehicles of five different classes will be admitted to the competition. The contest will be held over a course marked out in the extensive grounds of the Crystal Palace

Company. This course will in its character comprise the same descriptions of roadways that are met with in ordinary driving in suburban and rural districts. The course is, naturally, comparatively short, being no more than two miles in length; but the variations in the width of the road, and the declines and inclines encountered in the route, will supply an extremely good test of the capacity of the motor-vehicles competing and those in control of them. Some of the gradients are as heavy as 1 in 10. Additional interest will be afforded in demonstrating the perfect control under which drivers have their vehicles, and it is intended that at about six places on the course the cars shall be brought to a compulsory standstill within a space of twenty feet after the signal is given. The Crystal Palace Company are offering gold and silver medals, and the whole contest promises to be both interesting and useful.

#### Advance in the Motor-Car Movement.

It is only those intimately interested in the motor-car movement who are able to appreciate the large number of firms in England that are quietly working with a view of becoming concerned in the development of mechanical road locomotion on common roads. Amongst others, the well-known firm of Sir William Bailey & Co., of Salford, have recently decided to enter this new field. They have purchased a disused foundry at Patricroft, where it is intended to establish extensive motor-car works. Another firm who are working quietly, but none the less with energy and care, is the Anglo-American Motor Company, of Halifax. Their experimental labours are now reaching a point where production on a commercial scale may soon be expected. At present their intention is principally directed to one particular type of vehicle. The vehicle is designed to carry two persons, but an emergency seat is provided for the occasional use of a third person. The motor employed is of the twin-cylinder petroleum-spirit type of 6 h.p., electric ignition being employed, the necessary current being taken from accumulators. Three forward speeds and one backing motion are provided, and the gearing and power-transmission devices are such that chain and sprocket transmission is avoided. The speed-changing gear is one of the most simple, most noiseless, and less liable to wear than we have yet seen. In order to change speed all that is necessary is to move a dial-lever to the required spot, and to lightly press a foot pedal. The pinions of the speed gear are of the ordinary toothed variety, but the gear-wheel comprises an ingenious endeavour to overcome the wearing out of these wheels. It is so designed that no stripping of teeth is possible, and in the event of any damage occurring to these "teeth" they can be replaced in a few seconds without any cumbrous appliances or the use of other tools than those customarily carried on cars. The wheels are in themselves really "blanks," bearing on their periphery a groove in which is laid a piece of twin-roller cycle chain. The rivets connecting the side plates to the rollers of this chain are carried through the sides of the wheel in several places, and these are tapped and held in position by screw nuts. We hope to give further particulars of this interesting vehicle in a subsequent issue.

#### The Development of Public Motor-Vehicle Services.

THE development of the establishing of public vehicle services in rural and provincial centres still continues. Amongst other towns Middlesbrough is being provided with such a service by a syndicate recently formed. As we have already announced, Liverpool and Birkenhead are to have services, and we understand that a substantial subsidy has been given by the new Brighton Tower Company in order to assure that their undertaking is visited on the route of some of these projected services. Leicester is also shortly to have a service of five motor-vehicles. Eastbourne, however, is apparently not to have its service so soon as was anticipated, owing to the vagaries of the Town Council

and Clerk in licensing these vehicles for hire. We understand that it has been considered by these officials that a speed of six miles per hour should not be exceeded in the town and its vicinity; but as the horse-drawn cars considerably exceed this speed it is rather curious that such a limit should be sought to be put upon motor-vehicles. The projected Newcastle service is progressing apace, and we understand that five vehicles are to be ordered at once. What with these services, besides several others mentioned in previous issues, the further utilization of motor-vehicles by the Post Office, and their use by newspaper proprietors for distributing their journals, it is apparent that at last the commercial possibilities of motor-road locomotion are becoming properly recognised throughout the kingdom. The public service inaugurated at Easter at Brighton has now taken definite form. The Watch Committee has readily granted licences, and this week one car has been started running on a definite route. We understand that additional vehicles have been ordered for early delivery, and that it is intended to run these vehicles to Patcham, Ovingdean Grange and Stanmer.

### "WANTED: A VOITURETTE."

#### WHAT HORSE-POWER IS NECESSARY?

IN the correspondence columns of the present issue Mr. R. Lovelock states his inability to appreciate that it is necessary to have a motor developing at least 3 h.p. attached to a voiturette designed to carry two persons, and practically impugns the correctness of our contention. He offers the statement that a pony or cob properly harnessed to a light trap will easily haul a load of two persons, and by this supports his inability to appreciate the necessity of a 3 h.p. motor for the purpose described. Unfortunately our valued correspondent is not alone in his want of appreciation of our perfectly correct contention, and it is this lack of appreciation that has caused such very considerable dissatisfaction in the public mind in regard to motor-vehicles. Indeed, we may go further and state that the majority of those who, being new to the industry, have sought to design motor-vehicles have invariably been disappointed at the results of their labours by finding when too late that they have not properly appreciated the power to be exerted in effecting the work to be done.

We do not desire to go into the question of the data upon which the determination of a mechanical "horse-power" is founded, as such a course would prove valueless for the purpose in view. We may state, however, that in viewing the potential value of an animal horse-power the lay mind is frequently apt to neglect some portion of the work done or power output. For instance, the "power" exerted by a horse is generally held to be determined by the load it is able to pull; but it is a fact that the "power" of a horse is certainly much more than this. It has to move *itself*; it has to utilise its "power" or muscular force in lifting its legs and its body against gravitation. All this consumes power which is not taken into consideration when simply judging by means of the load pulled; the power exerted for these purposes is by no means the only power put forth by the horse.

Another matter which the lay mind is apt to leave out of calculation when considering the power necessary for motor-carriages is the great difference between hauling and propelling. Everyone who has tried to push a barrow, for instance, up a curb or pathway edging will acknowledge that the power necessary to be exerted is at least twice as much as that necessary were he to *pull* the vehicle over the obstruction. In mechanically-propelled carriages the load is not hauled, but is pushed; hence one reason for an apparent increase in power necessary to do the same work.

It might be argued from this statement that it would be better to employ a tractor to pull the load, and perhaps this would be the case; but even then it must be remembered that the tractor itself (with all its weight) in such a case is itself *propelled* and has to extend greater power consequently.

Another point considerably affecting the power necessary is the difference between the ability of a horse to *feel* an obstruction and to avoid it by reason of its animal instinct; no such power is, of course, possessed by the mechanical motor. Let us compare for a moment what happens when the wheel of a horse-drawn vehicle meets an obstruction with a similar state of things in a mechanically-propelled carriage. Directly the horse by its animal powers *feels* the obstruction, natural laws as well as animal feelings compel the animal involuntarily to divert its path of progression away from that side on which the obstruction is felt. This can be seen quite frequently when the wheels of a horse-drawn carriage either strike the curb or come into collision with other objects, great or small. The motor or engine has, of course, no such appreciation and no such instinctive manner of directing the steering wheels—which are generally quite outside its control—away from the obstruction, and by this means avoiding it; all it can do is to endeavour to push its load *over* the obstruction, and in this endeavour the vehicle is rather turned towards the obstruction than away from it.

It is extremely difficult to describe in definite terms what the power of a horse really is, and there are many extremely interesting points that arise in comparing the so-called horse-power of an engine and that of perhaps the noblest member of the brute creation. The majority of these, however, are of far too technical a character for these columns and we will not therefore enter into them. There are one or two other points which crop up in the comparison, however, to which allusion may fairly be made.

A horse when commencing to draw its load, starting from rest, is in a position to exert its full power under the most favourable conditions. It is able not only to use its muscular power by bringing its feet to an anchor on the ground and using its legs as levers to overcome the resistance, but it is also able to *profitably* use its own great weight. It throws forward its body and, as it were, “drops” its weight against its collar and the tightened traces, and thus brings its massive weight to the aid of its huge strength and the power possible to be exerted by means of Nature’s formation of its body and legs. An engine has, of course, no such ability to utilize its weight, and besides works under additional disadvantages. The capacity or power of an engine is calculated upon its working at a predetermined number of revolutions per minute. For instance, if a six-horse-power engine is designed to develop that power when its crank-shaft, or its equivalent, is turning at the rate of 600 revolutions per minute, that horse-power will not be developed if its crank makes less than that number of revolutions. It is at the moment of starting from rest or when meeting with an obstruction that it is necessary that the greatest power shall be exerted, and it is at this moment that the engine is least capable of exerting its full power—unless, indeed, it is first run at its designed speed, and then geared down to the vehicle.

It is well known that a horse can momentarily, and even for long periods, exercise more than its normal power. Indeed, it has been found that a single horse can exert for an appreciable length of time as much as twelve normal horse-power, and frequently in our streets it is possible to see a horse exerting at least eight horse-power.

The engine, by reason of its running at its predetermined speed, and therefore developing its rated power, has no such mobility even for a second of time, and this is another reason for providing a sufficient power in mechanically-moved carriages to carry out a duty perhaps considerably above that to be normally exerted when once started.

Another point occurs in making the comparison. The horse, when drawing a vehicle, exerts its power at the shoulder-level of its chest. The line of draft starts, then, above the axles of the wheels, and inclines backwards to the road. The power is exerted, too, at a point considerably in advance of the point of obstruction or inertia. The tendency in such a case, then, is to *lift* the vehicle, or its wheels, over an obstruction, owing to the inclination of the line of draft.

In mechanically-propelled carriages this is not the case. The power is exerted through a line level with the axles, or in some cases even below them. The power, too, is applied to the wheels themselves at a point but a little higher than the axle. The wheel does not *roll* forward on its axle, as is the case with a horse-drawn vehicle, but is thrust round upon it. As a result, the wheels, instead of being *lifted over* an obstacle or an inequality in the road surface are in effect driven into the ground behind the obstacle, owing to the effort to advance through adhesion to the road surface, with the result that a much greater power becomes necessary to surmount the obstacle. In a horse-drawn vehicle the adhesion of the road-wheels to the road is unnecessary, and is, indeed, a hindrance to the drawing of the load; all the necessary road adhesion is gained through the contact of the beautifully constructed hoof of the horse with the roadway at a point in advance of the weight of the load. With a mechanically-propelled carriage the opposite is the case. The fulcrum is the same in both cases—the earth; but as the motor-vehicle has to do without the adhesion of the horse’s feet and the leverage exerted through its legs, it has to provide the adhesion and the leverage through its wheels at the point where the weight of the load rests. Hence another reason for the provision of a much greater power in vehicles actuated by mechanical means to that necessary with those hauled by animals.

Another point may be considered with advantage. It is, of course, well appreciated that a heavy horse is able to drag or haul a greater load than is a lightly-framed horse, even although the actual muscular power of both may be equal. The reason of this can be found, we think, if the problem is carefully examined. If one examines the progression of a horse, it will be noticed that its body alternately rises and falls in a regular sequence of curves. Now, when the body rises it is being lifted by muscular force against gravity; when it descends it falls by gravity alone. In addition, when it falls the whole weight of the frame of the horse is brought against the collar, and this continually “undulatory throwing” of its weight on the traces of course materially assists the hauling of the load attached thereto. The more heavily-built horse thus possesses an advantage over his more lightly-framed competitor, in that its additional weight is utilized in assisting its muscular strength to haul the load behind it.

We have written thus fully on the matter for the reason that we recognise the importance of this problem in mechanical road locomotion being properly appreciated by those lay members of the public who take an interest in the subject. The subject is a difficult one to explain without employing technicalities, but we hope our efforts will enable our correspondent, Mr. Lovelock, and others of our readers, to appreciate the reason, indeed the necessity, of employing nominally greater horse-power in mechanically-propelled road vehicles than is nominally obligatory in the case of animal traction.

In case Mr. Lovelock or others of our readers desire to carry out a test for themselves which, we are sure, will furnish them with sufficient proof of the correctness of our statements, we offer them the following means of doing so. Let a horse, cob, or pony be harnessed in the usual way to a light two-wheeled cart. Let this cart carry a load fully equal to the potential capacity of the horse at its ordinary rate of speed. Permit the horse to draw this load at its ordinary speed over a given road, carefully noticing the time taken to traverse a given distance (not necessarily a very long one), and also noticing the condition of the horse at the conclusion of the run. On a subsequent day and under similar climatic conditions load up the cart with the same weight, but this time let the horse push the load by its shoulders and chest. This can be done by placing the horse between the shafts with its head towards the vehicle, and so harnessing it that a shoulder-band or strap attached to the shafts enables the horse to thrust its weight against it, and so push the vehicle and its load forward, tail-board first. Bit the horse in the

usual way, carrying the reins through the rings of the saddle pad, and bringing them back to the driving seat, which, of course, must now be made to face the tail-board of the cart. The horse can be driven quite easily, the reins being used tiller fashion. It will be found that the horse can neither travel at the speed nor overcome road obstacles either natural or artificial nearly so well as when hauling, and its condition at the conclusion of the same run will demonstrate quite visibly that it is easier to haul a load than to propel or push it, even when the many other problems connected with mechanical locomotion on roads are entirely neglected. The undulatory movement of the horse and the consequent utilization of its weight will, during the "pushing" trial, not aid it in the slightest, indeed, it will be found to hinder it, as it will tend to drive the wheels into the ground behind the obstacle instead of assisting to overcome it by lifting them over it, just as is the case with mechanically-propelled vehicles.

## MOTOR-CARS ON THE CONTINENT.

### Motor-Car Excursions in France.

thus following the practice of the English Automobile Club. There is no doubt that if racing is discouraged in these tours the French automobilists will readily appreciate those pleasures which their British *confrères* have found so pronounced in motor-car touring. Touring contests embodying racing have been frequent enough in France, but we congratulate Monsieur Escarraguel and the Automobile Club Bordelaise on having at last inaugurated a series of non-competitive tours, which we are certain will be thoroughly well enjoyed and appreciated by all who take part in them.

### Public Motor- Vehicle Services in France.

THE provincial centres of France are becoming increasingly appreciative of the value of motor-vehicle services in rural districts and between those towns whose situation prevents an adequate railway service. Just as in England, so it is in France, and day by day in all parts of the country advances are chronicled in the founding of motor-vehicle services. The Société Général des Transports Publics Automobiles have already started their service at Libourne, and they are so pleased with the success of this undertaking that they are using their best endeavours to bring into immediate organization additional services on the Libourne-Saint Andre de Culzac road, and on the Libourne-Guitres road. We understand that the establishment of such services will not only be welcomed by the Municipal authorities through whose districts the vehicles will pass, but also by the population of the localities served by these projected services. Between Valence and Crest a Scotte Road train already carries out a motor-vehicle service, and it is now projected to continue this service further in this district, and to run a through service during the coming season between Valence and Montmeyran. Two road-trains leave each end of the route twice a day—namely, at 7 o'clock in the morning, and at 4 o'clock in the afternoon.

### Automobile Fêtes at Spa.

As has already been announced, a series of fêtes has been organized to take place at Spa between July 3rd and 7th next, and a series of contests and demonstrations which will include several diverse features will be arranged in the programme. There will be two classes of races, one designed specially for vehicles constructed for

racing, and the other suited for touring vehicles. The course of the touring vehicles will be from Brussels to Spa, whilst the speed trials will take place at Spa itself. During the holding of these fêtes it is intended to promote a congress of automobilists with a view of discussing and forming some plan for advancing international touring. The congress will open on July 3rd, the speed race will take place on the 4th, the touring race and hill-climbing competitions on the 5th, whilst the 6th will be devoted to the distribution of prizes and a floral fête, the *concours* terminating on the 7th by the whole of the participants proceeding on an excursion.

### Automobile Vehicles in Frankfort.

WE have already announced the establishment, on an experimental scale, of a motor-cab service in the City of Frankfort, and we now learn that these experiments, which have extended over a period of two months, have been conducted entirely without accident, and also with very favourable commercial success. In fact, the general results are regarded as being so satisfactory that an extension of the service is designed to take place within the next two months.

### The Rallie-Papiers Races at Nice.

SOME weeks ago we announced the holding of a motor-car paper-chase amongst the novelties projected by those responsible for the automobile features of the recent Nice carnival. This novel competition, in which we can see nothing very pleasurable, duly took place, Monsieur P. Chauchard laying the track, which extended through Caques to Villeneuve-Loubet. The start took place at the Magnan Bridge, and the course was completed by vehicles of the carriage class in forty-nine minutes, Monsieur Clerissy being actually first home. In the motor-cycle section the course was completed by Monsieur Mercade in thirty-nine minutes.

### Toll-Gate Taxes in Belgium.

As has been the case in England, so it has in Belgium in respect to the contest between the toll-gate authorities of the country and the owners and drivers of motor-vehicles in regard to the classification of such vehicles and the tolls payable by them under the different classifications. Monsieur Debruyne, the Belgian Minister of Agriculture, has now apparently set the matter at rest by informing toll-gate keepers in Belgium that automobile vehicles of all classes, including motor-tricycles and cycles and other such vehicles, shall pay for the future a toll fee of five centimes for each pair of wheels attached to the vehicle, tricycles being held to carry two pairs of wheels. This is a very satisfactory decision, and will avoid much inconvenience to automobilists traversing some of the Belgium roads. We would that some such similar decree were put in force in England, but we fear that there is very little hope of Governmental authority overcoming the rapacity of private owners and farmers of tolls, and that English automobilists will for some time to come have to fight privately against the extortionate charges at many of these barriers.

### Motor-Car Exhibition at Antwerp.

It is now announced that the Committee of the first Antwerp Salon du Cycle et de l'Automobile have decided that their Exhibition shall be held in Antwerp during the period between May 10th and 28th next, in the large hall of the Société Royale de l'Harmonie. Our correspondent reports that the demand for space is already very considerably in advance of that available, and although every inch of room has now been allotted, manufacturers and others desirous of exhibiting have had their demands cut down in

every instance, whilst many others have been entirely left out of the Exhibition.

#### Motor-Cycling in Russia.

THE craze for motor-cycle racing on ordinary roads has now reached Russia, some impetus having been given to this continental fashionable sport by the taking up of motor-cycling by several members of the Russian Royal family. The Société Velocipedique of St. Petersburg has organized a bicycle race between Moscow and St. Petersburg on June 15th next, and in this competition is included a special class for motor-tricycles. The distance to be traversed is 680 kilometres, and it is evident that the participants will have a chance of thoroughly imbuing the Russian populace with the ability of their vehicles to travel this long distance with ease.

#### The Bordeaux-Périgueux Races.

WE have been favoured with a copy of the conditions and official programme issued by the special Committee of the Bordeaux-Automobile Club, governing the Bordeaux-Périgueux race, and the exhibition and meeting to be held subsequently. The route of the race itself is between Bordeaux and Périgueux, with an ultimate return to Bordeaux. The Bordeaux-Périgueux section will be run on Sunday, May 21st, whilst that between Périgueux and Bordeaux is set down for negotiation on Monday, May 22nd. The whole of the vehicles participating in these races will have to take part compulsorily in an exhibition which lasts for the remainder of the week, and which will take place on the Concerts-Promenade des Quinconces, special prizes being offered by the committee of management of this establishment. Competitions of a minor character will also take place during the continuance of the Exhibition. Three classes of vehicles are admitted to the main contests. These comprise racing vehicles, touring carriages, and heavy vehicles designed either for carrying a large number of passengers or a heavy load of goods. The racing vehicles are divided into two types, one comprising motor-cycles and voituresses weighing under 400 kilogrammes, and the other, carriages seating two persons and weighing more than 400 kilogrammes. The touring vehicles are divided into four classes, three of which are classified into two sub-divisions. Class A comprises all carriages having motors of 8 h.p. and over, and this class is divided into those types designed to carry two persons and those which carry four or more. Class B comprises vehicles having motors from 6 to 7 h.p., and this is also sub-divided into divisions for two-seated and four-seated vehicles. Class C embraces vehicles having motors developing from 4 to 5 h.p., this being also divided into two sub-divisions of two and four-seated vehicles. The remaining, Class D, comprises motor-tricycles and voituresses weighing under 400 kilogrammes. The heavy-weight categories include omnibuses carrying at least ten persons, medium-load motor-vans, and motor-delivery wagons weighing more than 1,000 kilogrammes. The distance between Bordeaux and Périgueux is 116 kilometres, and dangerous level crossings necessitate two obligatory stoppages. The first is at St. Médard de Guisieres, 48 kilometres from the start, and the second at Mussidan, 82 kilometres from the start. Valuable prizes are offered, and a large number of entries have already been received.

#### Motor-Car Races at Antwerp.

IN connection with the Antwerp Motor-Car Exhibition, it is intended to hold several races, which, as at present arranged, will take place on May 14th next. The vehicles are divided into four classes: (1) Racing motor-tricycles; (2) Touring motor-tricycles. The course for both these classes of vehicles is by way of Merxem and then by Berg-Op-Zoon, Puppe, Calmthouche, Achterbrouck, Brass-

chaet, and thus return to Merxem. The third and fourth classes will consist of voituresses weighing under 300 kilogrammes and voituresses weighing more than that weight. The course for these will be from Merxem via Schooten, Boterneck, Brasschaet, Hoogboom, Capellen, Donk, and back to Merxem. Gold, silver, and bronze medals are to be awarded, as well as money prizes.

#### Voiturette Races in France.

THE voiturette contest organized by our Parisian contemporary, *La Presse*, promises to be a successful affair, twelve competitors having already entered at the time of our correspondent despatching his weekly letter. The competition will take place during the period between April 20th and 30th. The vehicles entered are peculiarly diverse in character, many of them in no way embracing the characteristics of what we term a voiturette in this country. They are as follows: 1. A Phébus motor-tricycle, trailing a voiturette; 2. A Phébus quadricycle, propelling a fore-carriage; 3. A three-wheel Phébus voiturette; 4. A Phébus automobilette; 5. A light carriage constructed by Turgan & Foy, having four wheels, weighing 180 kilogrammes, and priced at £160, propelled by a 4-h.p. motor; 6. A combination of a voiturette, bicycle, and tricycle, all convertible, the voiturette carrying the motor, made by Crossot, the vehicle weighing 140 kilogrammes; 9. Three motor-tricycles constructed by Monsieur P. Rennaux; 10. A Comiot motor-tricycle fitted with speed gearing, and trailing a voiturette, carrying two persons, and weighing 163 kilogrammes.

#### A Strike of Automobile Engineers in France.

FROM private information recently received from Paris it would appear that the French constructors of automobile vehicles are likely soon to be placed in a very awkward position. As is well known, most of these firms have a large number of orders on their books for specified delivery at certain dates. The difficulties, already sufficiently large, in fulfilling these contracts, are likely to be added to, as we understand that certain agitators are fomenting the French engineers employed in these works, in order to secure their simultaneously leaving work. The pay received by these men is considerably above that received by engineers employed in other sections of the engineering industry in France, and therefore it is a disgraceful abuse of the power of organization that they should now seek to strike work.

### NOTES FROM THE WORLD OVER.

It is reported in the U.S. papers that the Commissioners of Fairmount Park, Philadelphia, have followed Boston's lead and prohibited automobiles from entering the park. This will, of course, be recalled ultimately.

A NEW company has just been registered in Paris (10 Rue Hollvry), with a capital of £60,000, and with the title *La Compagnie des Automobiles et Cycles Hurtu*, to acquire and carry on the business of Messrs. Hurtu.

It is said that a Chicago electric vehicle company has closed a contract to supply pleasure motors for several Bombay princesses. The order aggregated £5,200, and the vehicles will be shipped during the early summer.

A DISCUSSION is being carried on in the correspondence columns of our French contemporary, *La France Automobile*, as to whether a *backward* or reverse motion is necessary in motor-vehicles. So far the bulk of opinion is in the affirmative.

A COMPANY has just been formed with a capital of £5,000 to be known as the Lancaster and Morecambe Motor-Car Co., Ltd., to carry on business as motor-car, omnibus, coach, and carriage proprietors, jobmasters, general carriers, etc.

# Leaders in Mechanical Road Locomotion.

## No. 3.—MONSIEUR ARMAND PEUGEOT.

IN selecting Monsieur Armand Peugeot for the third of our series of photographic reproductions of the leaders of mechanical road locomotion we desire to do honour to one whose energetic work in endeavouring to perfect motor-vehicles is, perhaps, not too well recognised either in France, the scene of his labours, or in England, where the results of his experiments are known and appreciated perhaps only by a small number of those who are interested in the "new industry."

Monsieur Armand Peugeot was born in 1849, at Valentigney. After having had a college education in his native country he came to England, not only with a view of perfecting his knowledge of the English language, but also to gain experience in British engineering practice.

The firm of Peugeot Frères was established in the same year that the subject of our sketch was born (1849), and, like many another large undertaking of the present day, it was at the date of its formation but a very small concern.

After completing his apprenticeship in England Monsieur Armand Peugeot returned to France in 1871, and at once took a prominent position in the works established by his father and his uncle. The firm of Peugeot Frères had during the time built up a considerable reputation for the excellence of their productions in furnishing ironmongery. This reputation suffered in no way by the advent of Monsieur Armand Peugeot, for it was due to him very largely, if not principally, that the firm's business continued to increase in extent and at the same time gained enhanced reputation for excellence of workmanship and material, until at last it is in extent amongst the largest works of its class in France, with a reputation entirely unsurpassed.

Monsieur Peugeot was a believer in the cycle. It was through his persistent advocacy that his firm took up its manufacture, building large works specially for the purpose, and making them one of the best equipped in France. In 1876 the style of the firm was changed, and it then became known as "Les Fils de Peugeot Frères." From the time that cycle manufacture was undertaken Monsieur Peugeot also determined that he would also be an early participant in the motor-car industry, whose advent and scope was then just beginning to be recognized in France.

Monsieur Peugeot at first turned his attention to a light self-propelled tricycle, but having very little faith in the permanency of this type, soon devoted his energies exclusively to heavier types of motor-vehicles. He examined many systems, and like his engineering contemporaries, Count de Dion and many others, first turned his attention to vehicles to be propelled by steam. He was certainly the first enthusiast in motor-vehicles to appreciate at its true worth the Serpollet boiler as an aid to mechanical locomotion on

common roads, and it was at the Valentigney works that the Serpollet boiler was first utilized in a road motor-vehicle. Indeed, the motor-car exhibited on Monsieur Serpollet's stand at the Paris Exhibition of 1889 was built at the Peugeot works at Mandeure. Monsieur Peugeot soon recognized, however, that the use of the coiled tubes with their minute interstices, as then used in the Serpollet system, was fraught with serious disadvantages, and he then turned his attention to impulse or explosion engines.

It was at this time that Monsieur Armand Peugeot came into contact with Herr Gottlieb Daimler and the late Monsieur Emile Levassor, who drew his attention to a light carriage propelled by a Daimler engine that did its duty very well indeed, so far as was considered "well" at that comparatively remote period. Monsieur Peugeot at once recognized the value of this engine, and with characteristic energy co-operated with Monsieur Levassor in promoting its successful application to motor road vehicles. Working quite independently, he soon produced successful vehicles; indeed, the first petroleum-spirit motor-car to successfully undertake a long journey was made by the Peugeot firm. This was in 1891, when the now-celebrated Peugeot car made its historic journey from Valentigney to Paris, from thence to Brest and back to Paris, and ultimately again to Valentigney, accompanying the competitors in the first great long-distance cycle race held in France, and reaching home, we are assured, in excellent condition. Since that the Peugeot carriages have taken first prizes in the Course du *Petit Journal* in 1894; the Paris-Bordeaux-Paris race in 1895; the Bordeaux-Agen race in 1896; and the Paris-Marseilles-Paris race in 1896.

The Peugeot firm followed the fortunes of the Daimler motor for several years, using even the latest form, the Phénix, until Messrs. Panhard & Levassor, the Daimler licensees, could supply no more, owing to their output being required for their own use. Nothing daunted, Monsieur Armand Peugeot, assisted by Monsieur Rigoulot, an engineer as skilful as he is modest, devised a horizontal motor possessing many excellent features, especially in the

valve-operating mechanism, which has been utilised in all the Peugeot cars produced subsequently.

For a time the "sun" of the Peugeot cars was slightly dimmed by the dazzling effulgence of the successes won by the cars of Panhard & Levassor; but not for long was this the case, and only quite recently an 18-h.p. Peugeot car won the Nice-Castellane-Nice race, the La Turbie contest, and the mile record, as has been recently chronicled in the columns of this Journal. Doubtless other successes still await the Peugeot cars, although the firm of Panhard & Levassor are trying to produce a 12-h.p. car which they hope will gain the laurel wreath in the next competitive meeting with the Peugeot vehicles. Although essentially a "business" man, and one whose

MONSIEUR ARMAND PEUGEOT.

energies find a ready outlet in the solving of problems connected with the automobile industry, yet Monsieur Armand Peugeot has found time and opportunities of demonstrating that he has a ready sympathy with the troubles and life-problems of his less fortunate and successful fellow-men. He has inaugurated many beneficent schemes for the working man, and has endowed many charitable and benevolent institutions at Valentigney. He inaugurated and financially supports an old-age pension scheme for his employes who are past work, and for this alone, as well as for many other benevolent actions, he is venerated and esteemed by his fellow-men.

With a personality direct, clear-headed, and without guile, Monsieur Armand Peugeot is always a *persona grata* with Englishmen, whilst his reputation for just dealing and conscientious fulfilment of his undertakings ensures a ready appreciation of his merits alike from Englishmen and his own countrymen. He was decorated a Chevalier of the Legion of Honour in 1889, and carries a mark of the appreciation of his value by his fellow-citizens in the fact that he has been re-elected a Municipal Counsellor of his city for the last twenty years.

DICK FARMAN.

A SYNDICATE has been formed in Vancouver for the purpose of introducing automobiles into British Columbia. While they will first be brought to Vancouver, it is confidently expected that the business of the company will be extended to include Victoria, and perhaps other cities on the coast.

We learn that the construction of motor-tricycles is being taken up at the Minerva and Romania Cycle Works of Messrs. S. de Jong & Co., at Berchem, near Antwerp. No particulars beyond that the motor to be employed is of a special type which will not infringe the De Dion motor patents are so far available.

MORGAN'S CHAINS AND PEDALS, LIMITED, was registered on March 29th by F. J. Richards, 28 Bedford Row, W.C., with a capital of £10,000 in £1 shares, with the object to enter into an agreement with H. Morgan, L. K. Elkington, and A. E. Beck, and to carry on business as manufacturers of and dealers in pedals, chains, cycles, and the components thereof, motor-car builders, etc.; managing director, H. Morgan.

TYRES, LIMITED, is the title of a company registered on March 28th by Jordan & Sons, Limited, 120 Chancery Lane, W.C., with a capital of £10,000 in £1 shares, with the object to carry on business as builders of and dealers in cycles, motor-cars, and other vehicles, tire manufacturers, etc. The directors are to be elected by the signatories. Qualification not specified. Remuneration, £50 per annum each; chairman, £75.

THE GERMAN CYCLE DEALERS' ASSOCIATION is organizing a cycle and motor-car show, to be held in Leipzig in the second half of October next. The show will be held for five days, during which only exhibiting manufacturers, members of the Association, and *bona-fide* dealers will be admitted. One of the conditions imposed by the Association is that all finished cycles, motor-cycles, and vehicles exhibited must be of German or Austrian make, but in the parts and accessory departments foreign makers will be allowed to exhibit.

MCDOWELL'S, LIMITED, is the title of a new company registered on March 29th by Cole & Jackson, 35 Essex Street, Strand, with a capital of £10,000 in £1 shares. Its object is to acquire the business of coach and carriage builders, tram-car builders, cycle makers, motor-car builders, etc., as now carried on at Warrington and Northwich by Maskery and Co. and at Liverpool by John McDowell & Sons, and to develop and extend the same. The directors are J. McDowell, sen., J. McDowell, jun., G. C. McDowell, and S. McDowell. Qualification, £500. Remuneration to be fixed by the company.

## THE AMÉDÉE BOLLÉE CARRIAGES.

THE name Bollée is, in England, principally associated with the *prénom* "Léon," and with the light three-wheeled voiturette to which the name Bollée has become attached in this country. Another Monsieur Bollée, however, exists in the automobile world, and this member of the family, Amédée, jun., has devoted his attention to vehicles of a heavier type than those associated with the name of Monsieur Léon Bollée.

FIG. 1.—ELEVATION OF AMÉDÉE BOLLÉE MOTOR-CARRIAGE.

The Amédée Bollée vehicles are made by the well-known railway engineers, De Dietrich & Co., of Luneville, France, and have now acquired a reputation in France quite on a par with that of the Levassor, Peugeot, and Mors types of vehicles; indeed, at the present moment the Amédée Bollée, the Mors, the Levassor, and the Peugeot vehicles are all struggling for a supremacy very difficult of attainment.

Figs. 1 and 2 give diagrammatic views of the constructional details of the Amédée Bollée cars, which are all built on the same form and type of frame, whilst Fig. 3 gives a photographic reproduction of a racing car of this type, whose constantly maintained speed on the level is 60 kilometres (say 37½ miles per hour), so that the glass protection placed in front of the driver becomes a desirable adjunct to the vehicle. The form of the vehicle body, it will be noticed, is so designed as to offer the least resistance possible to wind pressure, and the whole of the upper part is constructed of thin sheet aluminium, to gain as light a construction as possible.

FIG. 2.—PLAN OF AMÉDÉE BOLLÉE MOTOR-CARRIAGE.

The mechanical details of the car are shown in Figs. 1 and 2, which diagrammatically represent the standard method of arrangement. It will be recognised at once that the method of giving motion to the rear road-wheels is essentially different from that employed by any other manufacturer or designer. It is, in fact, a combination of belt and bevel-wheel driving, and it is claimed that by the combination the advantages of both systems are conserved whilst the disadvantages are avoided.

The motor is of the horizontal two-cylinder type, the cylinders being cast in one piece, and having a water-jacketed

FIG. 3.—GENERAL VIEW OF AMÉDÉE BOLLÉE RACING CAR.

space around their walls. The connecting rods of the two pistons are carried on to one crank, the crank being set at an angle of 180 degrees, and the explosions are so arranged that they alternate in each cylinder, the crank-shaft thus gaining an impetus from the motor each revolution, the motor being of the two-cycle type. The ignition of the charge is effected by means of the incandescent tubes, *a a'*. The speed of the motor, which is normally 600 revolutions, is governed by the ball-governor *h*. Power is communicated from the crank-shaft, through the medium of the fast pulley *P*, by means of a belt to the fast and loose pulleys *F, F'*, carried on the first intermediate shaft *A*. This shaft carries a set of four gear-wheels *B'*, fixed on a sleeve that is free to move on the shaft *A*; these gear-wheels transmit power to the second countershaft by a corresponding series of four gear-wheels, *B*. The bevel pinions *L* fitted on each end of this second intermediary shaft convey power to the doubly articulated shafts *D* and *D'*, which in turn transmit it through the bevel-pinions *P* to the bevel-wheels *M*, fixed on the rear road-wheel axles. In this manner chain and sprocket transmission is avoided. The second intermediary shaft carries a "jack-in-the box" or compensating gear *K*, over which is carried the hand-brake drum *H*. The shafts *D* are articulated at two places, as will be seen on reference to Figs. 1 and 2, in order to provide a compensatory movement when the road-wheels are passing over inequalities in the road level.

Variations in speed travel are effected by means of the engagement of different members of the two groups of gear wheels *B* and *B'*, this being effected through the clutch *V* actuating the sliding sleeve carrying the gear wheels *B'*, by

means of jointed levers controlled by the hand-lever *J'*. The fore-wheels are carried on short vertical axles, the necessary movement for steering being effected by Ackermann gear controlled by the hand-wheel *I'*. The hand-lever *G''* controls the belt-shifter *G* through the medium of jointed levers *G'*, and the hand-lever *H'* controls the band-brake on the brake-drum *H*. The levers controlling the belt-shifting, the speed-changing device, and the band-brake, are so connected together that on applying the band-brake the belt is shifted on to the loose pulley *F'* automatically; this is also the case in some of the earlier cars when the speed-changing gear is operated. In vehicles of later construction, however, a friction-clutch actuated by a pedal is fitted in the pulley *P* carried on the crank shaft, and this permits not only a much quicker stopping of the car, but saves the trouble and wear and tear of continually shifting the heavy belt.

The motor, being carried in front of the car, is very readily accessible, and as the whole of the transmission and operating gear is carried at the back of the vehicle, this is also conveniently placed for examination and attention. It will be noticed, too, that both motor and mechanism are placed under the frame of the car, so that stability is ensured. The cylinder walls and explosion chambers are cooled by a water circulation, but no pump is employed, the circulation acting on the thermo-syphon system. Every provision is made for controlling the air admission to the explosion chamber, and the richness of the explosive mixture can be increased or diminished at will, whilst by an automatic arrangement the different qualities of the explosive mixture are also controlled by the speed of the motor itself.

It is a peculiar feature of this type of car that Monsieur Amédée Bollée was the first to successfully use a horizontal high-speed engine on a motor-car, and in this respect other constructors, including Peugeot, Ducroiset, and Augé, have followed in the footsteps of Monsieur Amédée Bollée, jun., the third member of a family which includes a father and two sons, all separately interested in the motor-car industry in France.

## SCOTTISH NOTES.

### The Benz Car.

I HAD an opportunity recently of renewing my acquaintance with the Benz motor. Some two years ago I was unfortunate enough to sample a Benz car, as it was then sent into this country with its 1½ or 2-h.p. engine, and in a hilly country like ours it can easily be imagined it proved an endless source of sorrow and disappointment. The motor, of course, was too weak, and while perhaps quite ample for flat roads, was quite unsuitable for work in Scotland. When I recall my early struggles, and compare my first experience with that of the past month on the latest type of Benz, I realise that during these years the manufacturers have not been idle. While the pleasing design is still retained the power of the motor has been considerably increased, with the result that all ordinary hills can be surmounted with comfort. For a car of its class the Benz is certainly hard to beat, although it has often surprised me to find very low-grade workmanship in several parts, and which is still visible in the latest productions from the Mannheim works. A little more care exercised in the manufacture and fitting of these minor parts would go a long way towards spreading to this country the popularity these vehicles enjoy on the continent. One of the most important improvements in the latest type is the introduction of the *double*-cylinder motor. This is a long step in the right direction, and after a good deal of practical experience I venture to predict that the industry will not be very old in this country before single-cylinder petrol motors will be things of the past. The increased power for use when required, the reduction possible in the engine-speed and consequent diminution in noise and vibration, and increased regularity in working, are all items of the first importance to the practical motorist. All these I noted in the Benz double-cylinder dog-cart which I recently had an opportunity of seeing at work. It would be well, I think, if British motor manufacturers kept this before them, and devoted their energies to the production of a motor with at least two cylinders, however many more they might have. The price will naturally be slightly increased, but the advantages obtained far outweigh the small additional cost.

### The Motor-Tricycle.

SINCE the advent of the mechanical vehicle I have always maintained that in the evolution of road locomotion the cycle came to prepare the world for the motor-car. The popularity of the ubiquitous cycle has undoubtedly gone far to make us a nation of mechanics, educating as it has done, more or less, vast numbers of the population by simple lessons in applied mechanics. From the management of a modern bicycle to the intelligent care and management of a motor-cycle or motor-carriage is but an easy step. We are not surprised, therefore, to find the number of the leading lights of Scotch cycledom who are adopting the motor-vehicle in some form or other increasing every week. From information I have received, motor-tricycles are coming into the "land o' cakes" in a merry stream, and no doubt sport promoters in the North will this year see it to be to their advantage, where practicable, to include in their programmes motor-cycle events.

### A New Comer.

THIS week the leading organ of the cycle trade in Scotland, *The Scottish Cyclist*, presents its readers with a motor-car supplement, which it is intended, I believe, to be continued without extra charge. In view of the slump in cycle advertisements, it is only natural that enterprising publishers should look around for "fresh fields and pastures new," but it is an open question whether this enterprise will meet with remunerative support for some time.

### Pennington Deliveries.

I HAD an opportunity this week of enquiring of Messrs. Stirling the cause of the delay in the delivery of new Pennington motors, which the public are so much interested in, and I have been informed that the delay is in no way caused through any defect in design or construction of the motor, but solely through the great pressure of work which is being experienced just now by every steel founder in the country, and the consequent lateness in the deliveries of steel castings. A change for the better in this respect has, I understand, set in this week, and the large batch of machines which on this account have been kept back for many weeks are now being rapidly completed, and will, I am informed, be delivered to the earliest customers very shortly.

### The New Club.

THE sunshine with which we have been favoured this week brought out more motor-vehicles than usual. I had an opportunity of hearing views on the subject of the New Club, and I found a lively interest being taken by Scotch chaffeurs in the proposal, a preliminary meeting in connection with which is, I learn, shortly to be convened, and it is to be hoped that the Club will be sufficiently firmly established to inaugurate its first tour at Whitsuntide.

### Electrical Carriages.

THE article in this month's *Royal Magazine* describing the electric and other marvels within the mansion of Sir David Salomons, at Broomhill, has been read with interest among automobilists here, and his opinion on the practical inutility of electric motors for carriages has given rise to a good deal of discussion. Coming from so eminent an authority it is worthy of notice, however. Of course, this opinion has been expressed by Sir David on many previous occasions; indeed, from the first he has pinned his faith principally to steam, with a somewhat grudging recognition of petroleum-spirit motors.

### The Easter Tour Photographs.

To find some three dozen beautiful photographs of the Easter tour of the Automobile Club reproduced in last week's issue of this Journal, surprised most subscribers in the North, and I have heard it described as a "smart bit of work." But, as I have assured many of these subscribers, this may be taken as a fair example of the "up-to-date lines" on which *The Motor-Car Journal* is being run.  
"BROWN HEATHER."

THE BEDFORD MOTOR-CAR SYNDICATE, LIMITED, was registered on April 6th by Burn & Berridge, 87 Chancery Lane, with a capital of £2,000 in £5 shares, in order to carry on in Bedford or elsewhere the business of tramway, railway, omnibus, motor-car, and van proprietors, dynamo and locomotive builders, etc., and to acquire and turn to account any patents. Registered without articles of association.

DEPARTURE OF THE MOTOR-VANS FROM THE "DAILY MAIL" OFFICES.

## A Smart and Paying Enterprise.

THE above engraving does not profess to illustrate any new type of motor-vehicle, but simply places on record the smart enterprise of the proprietors of the *Daily Mail* in issuing the first number of their Sunday edition last week. As is now generally well known, the proprietors of the *Daily Telegraph* and of the *Daily Mail* commenced issuing Sunday editions of their papers last Sunday, and the proprietors of the latter, on examining the times of arrival of the "newspaper trains" at various provincial centres, determined if possible to outwit the proprietors of the former paper by having the *Daily Mail* on sale in certain districts some hours before the arrival of the newspaper trains with the rival journal.

Mr. Alfred Harmsworth, who is an enthusiast in motor-road locomotion, at once turned his attention to motor-vehicles, and arranged at the last moment with the Motor Manufacturing Co., Ltd., for the supply of several vans, in order that his wishes in regard to early deliveries might be met. Two of these vans are illustrated above; the one on the right hand journeyed to Brighton, and the one on the left to Windsor and district.

The enterprise was so successful that the first delivery of the *Daily Mail* was made in Brighton two hours before the arrival of the newspaper train with copies of the other newspaper. Foreseeing the result of the early delivery (although Messrs. Harmsworth had despatched by motor-van every copy actually ordered in Brighton), it was decided to send by the newspaper train an additional double quantity. This was picked up by the motor-van at the station and distributed to the newsagents throughout the town before the *Sunday Daily Telegraph* had completed its first delivery to its agents.

The following is the log of the Brighton van :—Load,

12 cwt., driver and carman; time of leaving *Daily Mail* office, 1.57 a.m.; route travelled, *via* Reigate and Purley; error in taking wrong turn in route, 12 miles; time of arrival at Brighton, 7.20 a.m.; distributed papers to eight depôts and to various newsboys; stopped motor one hour for treatment; met 9.20 train at Brighton Station and distributed second batch of papers to same agents and newsboys; filled up spirit and water tanks and traversed town all day as advertisement; left Brighton 5.55 p.m. unloaded; arrived *Daily Mail* office, 11.30 p.m.

The Windsor and district van did equally well, and in this case various towns on the route were served with orders, stoppages and detours being made to reach the various agents' establishments. The following is the log of the van :—Load, 15 cwt., driver, representative, and carman; left *Daily Mail* office, 3.45 a.m.; stopped at Richmond (station) and delivered papers to agent; stopped at Kingston and delivered to one agent, stopped at Hampton Court and made one delivery, stopped at Sunbury and made one delivery, stopped at Weybridge and made one delivery, stopped at Addlestone and made one delivery, stopped at Egham and made two deliveries, stopped at Staines and made two deliveries; reached Windsor and made complete delivery by 8.10 a.m.; stopped motor about one hour at Windsor, and then returned to London, reaching *Daily Mail* office, 11.45 a.m. unloaded.

We understand that Messrs. Harmsworth are so satisfied with the result of their enterprise that they propose to employ as many vehicles as can be supplied on Sunday next, and that they are also contemplating employing motor-vans for their ordinary daily deliveries. In the meantime it is certain that vehicles of this type will be increasingly used by the firm.

# Improvements in the Bollée Voiturette.

FIG. 1.—GENERAL VIEW OF IMPROVED VOITURETTE, SHOWING NEW SPRING-SUSPENSION ARRANGEMENT.

ONE or two important detail improvements have recently been introduced by La Société des Voiturettes Automobiles, of 163 Avenue Victor Hugo, Paris, in the Bollée voiturette. As this vehicle is already very familiar to *chauffeurs* on both sides of the Channel, it is not necessary to give a lengthy description of it, and we shall consequently confine ourselves to the improvements above alluded to. One of the drawbacks to the voiturette has

be seen from Figs. 1 and 2, a cranked tubular axle is now employed, a large plate spring being introduced between it and the end of the frame. To strengthen the connection between the frame and the axle two short levers are mounted on the latter and connected at their lower ends to the tension stays of the frame. The two levers are free to turn on the axle and are pivotally connected to the stays so that they may adjust themselves to the relative vertical movement due to jolting,

FIG. 2.—FRONT VIEW OF NEW TYPE.

hitherto been that the frame, carrying both the motor and transmission gear, as also the riders, was mounted directly on the wheel axles, and thus all vibration, jolting, etc., over and above that taken up by the pneumatic tyres, was transmitted to the riders, while the rear wheel was subject to slide-slip or skidding. To overcome these disadvantages the Bollée Co. have now introduced a new type in which a plate spring is introduced between the frame and the front axle. In the old type, Fig. 3, the latter was straight, but as will

FIG. 3.—FRONT VIEW OF OLD TYPE.

etc., of the two parts—the front and the rear—of the voiturette. In addition to the increased comfort afforded to the riders the new suspension arrangement is claimed to considerably minimise the tendency to skidding of the rear wheel, the reason advanced for this being, according to *La France Automobile*, as follows: "The power which causes the rear wheel to slip sideways should, in theory, be absorbed by the forward progression of the vehicle or by the application of the brake. In practice, however, it has been found that neither of

these absorb all the power in question, but it expends itself in causing the rear wheel to drag laterally. In the new suspended frame the rear wheel, when turning, inclines slightly with the frame, the power which in the old system caused the wheel to slip being absorbed in compressing the plate spring." The new spring-suspension arrangement alters the appearance of the voiturette but little, the spring being hidden underneath the front seat; it can, we understand, be applied to existing vehicles at the cost of a few pounds.

The second improvement is in connection with the tube ignition employed on the Bollée voiturette. In the ordinary platinum tube there is a small collar fixed tight up against the tube-carrier, threaded into the opening in the explosion chamber by means of a capped nut, the bottom of which is furnished with rings or washers of asbestos. Owing to the progressive carbonisation, these rings require to be frequently tightened up; and also renewed from time to time, as any leakage at the joint would reduce the

FIG. 4.—THE NEW IGNITION TUBE FOR BOLLÉE VOITURETTES.

compression and interfere with the working of the burner to such an extent as to occasionally cause mis-fires, and so diminish the power of the motor. Furthermore, owing to the high temperature, it is not often possible to promptly put the burner into proper working order again. To overcome these drawbacks the Bollée Company have lately introduced a new joint, in which the use of asbestos washers and their consequent disadvantages are obviated. The joint comprises a tube-carrier *A* (Fig. 4), screwed into the opening in the explosion chamber in the usual way. The carrier terminates at its outer end in a small cone *a*. The end of the platinum tube *B* is opened out to a shape to fit tight over the cone *a*, the two parts *a* and *b* being held close together by the washer *C*. When the latter is fixed in its proper place the capped nut *D* is screwed down on to the tube-carrier *A*, the result being that the three parts of the ignition tube are hermetically maintained together without the employment of any packing whatever.

THE Belgian Army has been discussing motors, and in consequence a military committee will test automobiles with a view to military service. The experiments will be made with heavy loads, upon which will depend the eventual introduction into the army of automobiles.

In the annual report for 1898 of the Société des Constructions La Metallurgique, one of the leading Belgian engineering concerns, it is stated that at the Sambre works of the company "a new type of automobile has been designed and will shortly be submitted to the appreciation of the public."

THE London Traction Haulage Co., Limited, has been registered with a capital of £5,000 in £1 shares. It will adopt an agreement with J. Cattermole, and build and deal in and with motor-cars, traction engines, steam rollers, trucks, wagons, etc. The company is registered without articles of association.

THE Joel Electric Carriage, Motor and Battery Syndicate, Ltd., has been registered to adopt an agreement with the National Motor-Carriage Syndicate, Ltd., to carry on business as motor-car builders, cycle manufacturers, electricians, etc., and to acquire certain inventions relating to secondary battery plates, electro-motors, dynamos, gears, and dry electrolyte for secondary batteries.

## CORRESPONDENCE.

### THE MOTOR MAXIM GUN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I venture to correct a slight mistake made in your last week's issue with reference to the much maligned motor-tricycle employed by the 26th Middlesex Cyclist Corps to drag their Maxim gun at Aldershot this Easter. As the driver of this tricycle, I can only say that the 1½-h.p. motor built in England gave the greatest satisfaction, and in point of power was amply sufficient for the work it had to do, dragging the Maxim gun and gun-carriage, weighing over 140lb., with ease. On the journey down from London to Woking, the head-quarters of the cyclist corps, the exceptionally good time of four miles in thirteen minutes was accomplished. As a matter of fact, the only hitches that occurred were from the use of inferior lubricating oil and tire troubles. On Saturday before Easter the motor did on out-post duty without the gun 19½ miles in the hour over a hilly road, and had it not been for a tire coming off in a most vile and persistent manner the motor would have been voted a huge success, and all praise is due to the 26th for their pluck and enterprise. Apologising for troubling you in this matter,

Yours, etc.,

182 Gray's Inn Road, W.C.

CHARLES H. E. RUSH.

April 10th, 1899.

### WANTED, A VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Returning again to the subject of a "Voiturette," which appears so greatly in demand, I cannot in the least understand what you say as to the engine-power (3½ horse) required to drive same.

A pony or small cob properly harnessed to a vehicle easily conveys two persons where they desire to go.

We see daily a 6 or 7-horse power locomotive moving its ponderous self, and a whole train of vehicles behind it. Why in the world do we want a 3½-horse power motor to move two people about in a carriage constructed, say, on the latest principles as to wheels and bearings? I may be only simple minded on the matter, but it has been my fate to move many thousand tons of material at the least expense, both by steam and horse, and I have been able to watch the road locomotive and portable engine grow from infancy. Judged by the experiences thus gained, I have not a shadow of doubt that we shall soon get the "Voiturette" we want.

I congratulate you on the issue of your paper, which will certainly aid the work.

Yours truly,

R. LOVELOCK.

### EFFECT OF "BRAKING" ON PNEUMATIC TIRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter signed by Mr. L. Lecomte in your issue of the 17th ult. in reference to wheels and tires for motor-cars, he is asking for information on a point that I can very easily answer.

From actual experience, there is not the slightest harm to pneumatic tires if a car weighing 25 cwt. loaded, runs down a hill on gradients approaching somewhere what he mentions, but, of course, not being exactly the same.

There are several hills of this type which I have gone up and down very frequently, notably, Hand Cross Hill on the Brighton Road, Clayton Hill on the Brighton Road, Reigate Hill, and Westerham Hill. I think all these hills have certain portions steeper than one in twelve, and the car requires to be kept under brake control the whole time.

I do not see that there is any particular strain on the tire by doing this; at any rate, there is none set up in use that I can see; but I am taking it he does not mean brake

control through the tires or, rather, on the tires, as I should say that if the brake were only applied on the tires there would be a danger of the brake block becoming hot and damaging the tires.

Personally, I always try and use my band brakes only, only keeping the tire brake as an emergency brake.

Yours truly,  
S. F. EDGE.

London, 4th April, 1899.

### THE N.C.U. AND MOTOR TRACK RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that such an amount of interest is being taken in the above, I think it would interest your readers to know exactly the treatment that one is to expect from a body who profess to take over the government of a pastime when they are absolutely unprepared to do so. It will be observed by all that they cannot even see their way clear to answer a simple question which is put to them; moreover, they themselves seem to be in some doubt as to whether they will insist upon a motorist taking out a licence or not.

Trusting you will find space in your columns to insert the correspondence,

Yours truly,  
C. G. WRIDGWAY.

Manchester, April 6th, 1899.

MR. WRIDGWAY TO N.C.U.

The Secretary,

The National Cyclists Union,  
27 Chancery Lane, London, E.C.

March 27th, 1899.

SIR,—I am in receipt of a letter, dated 26th inst., from Mr. F. W. Baily, hon. sec. of the Crystal Palace Cycle Track, informing me that unless M. Rigal (my fellow competitor in the hour's race on Easter Monday) and myself hold professional licences you will regard it as an unregistered meeting, and that neither of us will be eligible to obtain a licence from you afterwards.

Now, first of all, I should like to know why it is that you have only just advised Mr. Baily, when the race has to my certain knowledge been notified in the press some considerable time since.

Secondly, why is it that M. Rigal and myself were not notified direct? Of course you may not have been acquainted with our addresses, but the cycling press would have assisted you in that matter.

Thirdly, what are your rules governing motor racing? Have they been published throughout the motor press?

Fourthly, if so, when? And I should like to have the dates.

Fifthly, by what right should I take out a professional licence? I certainly rode at about three meetings in 1896 and 1897 as a professional cyclist, but I have never ridden as a professional motorist. I am not in the motor trade, moreover, the machine which I am riding was bought and paid for by me.

Sixthly, what is the distinction between a professional motorist and an amateur motorist, and where is this distinction defined in your rules.

Seventhly, what is the licence fee, should one apply for an amateur or professional licence?

Eighthly, supposing a motorist should take out a licence from you and compete, or assist, in any race on the road, or at motor exhibitions, what would be the result? Would he be liable to permanent or temporary suspension, and which?

If you will kindly satisfy me in regard to the above questions by Wednesday next, it will give me time to further consider the question of a licence before Easter. Regretting that I cannot give you any more time to reply to this, but at the same time you must quite understand it is entirely through your own negligence in not intimating to Mr. Baily before.

Yours truly,  
C. G. WRIDGWAY.

N.C.U. TO MR. WRIDGWAY.

Date as post mark—March 28th.

I am in receipt of your letter which has been forwarded to Dr. Turner, 9 Sussex Gardens, Hyde Park, W., Hon. Sec. of the Pro-Licensing Committee, to whose department it refers.

(No Signature.)

Reverse side of post card:—

C. G. Wridgway,  
50 Keppel Road,  
Chorlton-cum-Hardy.

MR. WRIDGWAY TO N.C.U.

DEAR SIR,—I am in receipt of your post card of 28th, to which I have not replied sooner, as I have been waiting for a reply from the gentleman to whom you handed my letter. It astonishes me that you, as Secretary of the National Cyclists Union, and thereby conversant with all the rules and regulations appertaining to that body, should not be in a position to answer a few simple questions which I put to you in my letter

of 27th. Even had I been inclined to take out a N.C.U. licence, the mere fact of not receiving a satisfactory reply from you would have immediately settled the question, as I should certainly not take out a licence from the N.C.U., who wish to instal themselves as a governing body concerning motor racing, unless I have seen their rules and regulations. I asked you very fair questions, and questions which ninety-nine persons out of a hundred would have asked, and I cannot congratulate you upon the method in which the N.C.U. have started upon their self-imposed task, if this sort of treatment is a sample of what all motorists are to expect from you. I should certainly have thought that the governing body, who place themselves at the head of a sport or pastime, would have printed rules and regulations concerning that particular sport ready to be sent off at a moment's notice when they were required.

Yours truly,  
C. G. WRIDGWAY.

P.S.—It is customary in this country when addressing an envelope to a gentleman to insert the word Mr. before, or Esquire after the name, and not simply the name of the gentleman, but this is evidently a simple form of etiquette which has not been learned by the paid servants of the N.C.U. Perhaps you will kindly note in future.

N.C.U. (LONDON CENTRE) TO MR. WRIDGWAY.

March 29th, 1899.

DEAR WRIDGWAY,—In reply to your letter of the 27th inst., I beg to state that you are under some slight misapprehension with regard to the motor race on Easter Monday.

Mr. F. W. Baily has not applied for a permit, and it consequently follows that it is an unregistered meeting; and in consequence thereof, under the N.C.U. rules, you cannot obtain a licence either professional or otherwise if you ride at such a meeting.

I may say that the N.C.U. do not insist upon your obtaining a licence, but they only inform you that in the event of your riding at an unregistered meeting you would not be able to have a licence hereafter.

Motor races come under N.C.U. rules, 103, section F.

Yours truly,  
(Signed) W. MITSON, Hon. Sec.

MR. WRIDGWAY TO N.C.U. (LONDON CENTRE.)

DEAR MITSON,—I am in receipt of your letter of 29th ult., which I have only just received owing to my absence in London. I was surprised to have a reply from you considering that my letter was handed by Mr. Noble to Dr. Turner, and I had absolutely no acknowledgement from the latter. However, I suppose it is his general way of dealing with letters received by him, which shows his lack of courtesy. I am under no misapprehension whatever in regard to the motor race which was held last Easter Monday; all that I asked in my letter of 27th were a few simple questions to which, up to the present, I have not received any satisfactory reply.

You state motor races come under N.C.U. Rules 103 section "F." I have read this before somewhere, but that was not what I was asking, and it leaves me absolutely in the same position as I was before writing to the N.C.U. upon the subject. Now I will take a paragraph of your letter which runs as follows: "I may say that the N.C.U. do not insist upon your obtaining a licence, but they only inform you that in the event of your riding at an unregistered meeting you would not be able to have a licence hereafter." This is the first intimation that I have had from the N.C.U. upon the matter, and which information, by the way, arrived too late. Now I will take Mr. Coleman's letter of the 25th ult. to Mr. Baily, which runs as follows: "I have got leave for and I to time the motor races provided Wridgway and the Frenchman take out licences (which can be obtained from Dr. Turner at once) in the usual way." Who is correct? Here we have two officials of the N.C.U., and both differ on the same subject, and I take it for granted that any person racing under N.C.U. rules would be obliged to obtain a permit, either amateur or professional, before being able to compete in the races, yet you tell me that in my case it was not necessary. Am I the exception which proves the general rule?

Now, the whole thing turns upon the unsatisfactory manner in which the N.C.U. deal with letters demanding a few particulars from them; it is handed round on the it-is-not-my-work principle, and at the present time I am still awaiting a satisfactory and straightforward answer to my queries put forth in my letter of the 27th ult.

Yours truly,  
(Signed) C. G. WRIDGWAY.

### THE PENNINGTON v. MORS CHALLENGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of the Automobile Association, Ltd., one would think from their tone that they were actually anxious that this contest should come off; but from the fact that they have been constantly changing their ground and bringing in fresh conditions in each new letter, we are by no means so sure that they are in earnest, though if they are we will do our best to gratify them. It will be remembered that when we first took up their challenge, the editor of a contemporary, who had been chosen as umpire by both

sides, declined to have anything to do with a road-racing contest in this country, on the ground that such a contest would be an infringement of the law, and be detrimental to the best interests of the motor-car movement. When we therefore proposed, as an alternative, that the cars should be tested on a hill-climbing match, the Automobile Association protested against the idea, and said that motor-cars were not intended to act as "lifts." As, however, various correspondents, and the public in general, have felt that such a match would be of real interest to motor-car users—it being notorious that, up till now, many types of motor-cars have been very deficient in hill-climbing qualities—the Automobile Association have evidently now thought better of this matter and announce their willingness to run against us on the hill. We are willing, and hereby challenge the Mors car to a straightaway run, commencing ten miles south of the summit of Shapfell, on the main road between Kendal and Carlisle, which is practically one long ascent, both cars to make the ascent to the summit twenty-five consecutive times, and the car which makes the best aggregate time on this 250 miles of hill-climbing to be considered the winner; the time of descent not to be reckoned, but such is not to exceed the time occupied in the ascent. For this match we will enter our two-cylinder motor-car carrying two passengers—the Mors car to carry the same number—but we are indifferent as to whether their car has a 10-horse or even a 16-horse power motor, and has two cylinders or four. Of course, we shall not enter our little one cylinder 125-guinea car against a Mors four-cylinder 380-guinea car, as this particular car of ours is designed for popular use in England, and consequently is not geared high.

It must have amused your readers when such a proposition was made by the Automobile Association. The Automobile people have a good deal to say about the water circulation of our car, about which they evidently know nothing. Had we wished to say nasty things we might have referred to the way which the Mors car occasionally melts off its pipes, owing to over-heating, and it is possible this defect in the Mors car has made them think that we are labouring under the same disadvantages.

When the Mors car was on show in Manchester a few weeks ago we made several attempts, directly and indirectly, to get up an impromptu race with them, but there was always some excuse, such as tires gone wrong or some part needing to be replaced, to prevent such a contest coming off.

Yours faithfully,  
PENNINGTON & BAINES.

#### THE COMMERCIAL EFFICIENCY OF THE PENNINGTON CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Messrs. Pennington and Baines' letter in your last issue, I am afraid that I do not quite follow what it is that they really wish. All I want is to see one of their cars in the hands of a private user, so that I might accompany same for a run of about a hundred miles to see how it performs. The reason that I wish for this is because their car, on paper, seems to be exactly the thing I want myself.

The very thing which they advertise in the last issue of *The Motor-Car Journal*, and which they call their "Victoria de Luxe," is a car which I will at once purchase if they will show it to me running over a journey, providing it looks as if it would wear well.

Instead, however, of publicly testing their cars, or saying where some private user has one, they write a letter to your paper trying in some way to mix me up with company promoting and asking me if I had any interests in various companies who are interested in motors. Naturally I told them exactly what companies I was interested in, simply because this information was never private but always public property. They then say that I admit my connection. I never denied it. I was always proud of my connection with the companies referred to.

From these remarks, which seem to me to be of no interest to anyone, they go on to say that as I have the motor industry so much at heart they would like to match their 110-guinea car against some other car. Why I should be expected to find a car to match against theirs I really do not know. No company in which I am interested makes anything of the sort, and my interest in the Pennington car is simply that of a would-be purchaser. I see marvellous things claimed for the article, and want to have the opportunity of seeing these claims borne out in public.

I think if Messrs. Pennington & Baines would accept the challenges of some of the people who want to race them, instead of trying to make up more matches, which, so far, they seem to have taken good care not to let materialise, and run their car, under proper auspices, for five hundred miles on the road, it would do them more good, if they want to advertise the car, and would certainly prove whether their claims are carried out in practice or not.

In regard to the merits of the Ariel Tricycle, I have no doubt that the manager of the Ariel Company is quite competent to put them forward more fully than at the present, when the order book demands it, but until that time arrives it seems to me he would naturally conclude that it would be useless to spend money in trying to make matches with a firm who, up to the present, have issued many challenges, but so far have no doubt been too busy to carry them out when other people have accepted them.

From letters in your last issue it is evident that the Automobile Association are simply thirsting to take up Messrs. Pennington & Baines' challenge, and from what I have seen of their cars I should say that if the Pennington car can beat them it will be a great feather in their cap, and should make the Pennington firm so busy in executing orders that they should have no more time for writing letters to the press, which, up to the present, have carefully avoided the point at issue.

Yours truly,  
London, W.C., April 11th, 1899. S. F. EDGE.

#### ACCIDENTS WITH HORSE-DRAWN AND MOTOR VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one interested in the new methods of locomotion I was much struck by three incidents which came to my notice, whilst in London on Tuesday, in connection with horse-drawn vehicles.

No. 1. On passing Northumberland Avenue about mid-day I saw a hansom cab lying helplessly by the side of the road, with the off-side wheel completely smashed—evidently the result of a collision.

No. 2. In one of the streets leading off the Chelsea Embankment four or five men were vainly endeavouring to persuade a horse, attached to another hansom cab, to move. For four or five minutes I witnessed various interesting and, to me at all events, novel experiments to attain this end, but I left them at the end of this time with very little progress to show for their trouble. I say "very little" advisedly, for they had only succeeded in pushing the cab—and the horse as well!—a little further down the street.

No. 3. Coming along Piccadilly at night, a large number of people standing in the middle and on the side of the road attracted my attention. On going across, I found that their interest was centred upon a horse lying flat down in the road apparently helpless. The vehicle and harness had been detached, but all attempts to raise him, up to the time that I went on, proved fruitless, and I left those concerned with this—as I say, the third—trouble in connection with horse-drawn carriages which had come to my notice in one day, in a very unpleasant fix.

Of course, I know that the number of motor-carriages in use on the roads in this country is almost infinitesimal as compared with the number drawn by horses; but I only mention these incidents because there are some people strongly

opposed to mechanical traction who would have us believe that an accident never occurs with a horse—only with “those beastly stinking motor-cars”!

Yours, etc.,

London, April 12th, 1899.

G. H. A.

### MOTOR-CAR DEFENCE UNION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Bench in dealing with motor-car cases are prejudiced, as they were (and are even now) with regard to cyclists, and in consequence one is continually hearing of cases which are simply “Gilbertian,” although I have no doubt it does not strike the victim in this light.

Now, is not the time ripe for the formation amongst the motor-vehicle trade, the users of motor-vehicles, and those connected, of some such association as the C.T.C., that would be able to look after the interests of victims who may not care to be altogether responsible for a well-defended appeal or test case?

Would not the fact that a car was fitted with a “speed indicator” that had been tested and passed by some public body, allow the driver of the car to make a statement that would have weight in a police-court? I have seen these instruments on bicycles, and in fact have used them, and I have no doubt that there are makers able to turn out one that is reliable and cheap.

## THE “MOTOR-CAR JOURNAL’S” COMMERCIAL EFFICIENCY TRIALS OF MOTOR-VEHICLES.

IN connexion with the Exhibition of Motor-Vehicles to be held at the Agricultural Hall next July, the proprietors of this Journal have decided to inaugurate a series of trials of motor-vehicles, essentially from a commercial point of view. Racing forms no part of the programme, and it is a feature of these competitions that no vehicle shall travel at an average speed which is greater than the maximum permitted by law. Gold and silver medals will be awarded to all contestants who carry out a series of specified journeys within the limit of a certain given maximum and minimum time: thus the competitors will gain no advantage by indulging in racing, which, indeed, the proprietors of this Journal object to most strongly.

There are fourteen different classifications of vehicles, each one being allotted a task well within its capacity, and varying according to the type of vehicle, and to the regulations of the Board of Trade as to the speed to be travelled. The competing vehicles in each class will each have to travel over the same roads on the same days, and, excepting a few minutes' interval in their starting, exactly at the same hours.

The trials of each type of vehicle extends over three days, and the allotted journeys have to be completed within the limits of the set times on each of the three days, and this without effecting any repairs or making other adjustments than those within the capacity of an ordinary motor-car driver, and those possible to be effected by means of the kit of tools generally carried on such vehicles. A compulsory stop is arranged as nearly as possible in the middle of each day's task, and this is allowed for in the maximum and minimum times allotted for completing the journey. No allowance will be made, however, for any other stops, and it is needless to say that an observer acting upon behalf of this Journal will accompany each car. Shortly, the competition may be said to test the ability of the vehicle to run a given distance according to class or type out and home each day for three consecutive days. The routes selected will be of a fair give-

and-take character, and it is not proposed that any extraordinary task shall be set, it being the aim that the designed task shall be as nearly as possible in accordance with the duties required of a motor-vehicle in ordinary private use.

The classes comprise delivery vans carrying 15 cwt. of goods, propelled (a) by electricity and (b) by petroleum spirit motor; goods vehicles carrying 30 cwt., and goods vehicles carrying 3 tons. In addition, all these vehicles have to carry at least one person besides those necessary for driving the vehicle. The pleasure carriages are comprised in four classes, two of them being devoted to two-seated vehicles, one propelled by electricity, and the other by steam or spirit motors, and two classes for four-seated vehicles, one propelled by electricity and the other by steam or spirit motors. Four classes are devoted to motor-vehicles carrying eight persons and sixteen persons, one of each type being driven by electricity and the other by steam or petroleum-spirit motors. The fourteenth class is devoted entirely to carrier motor-tricycles or voituresses, having motors developing no more than 3 h.p., and carrying not less than 200 lb. weight of goods in addition to the driver.

Another competition also forms a part of the programme. This is for any type of vehicle carrying four persons or a similar weight in goods. The feature of this competition is the longest run possible to be effected with one supply of fuel, power, lubricant, etc., as is arranged for vehicles of the type entered. It is not intended that this class should embrace vehicles especially built with abnormally large power-supplies, but is intended to embrace commercial types of vehicles only. Arrangements are also in progress for furnishing the means for testing motor-tricycles. With these vehicles, however, speed is the great consideration, and these trials, if ultimately carried out, will be run on a racing track before the Exhibition takes place. The whole of the other trials will take place between July 3rd to the 16th, during the continuance of the Exhibition at the Agricultural Hall. The start and finish will be from the Agricultural Hall itself, and therefore the heavy traffic of Islington will have to be negotiated, both on the outward and homeward journeys.

Entry forms for the competition are now ready, and these, together with fuller particulars, may be obtained post free on application to the offices of this Journal.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publisher beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, APRIL 21st, 1899.

[No. 7.

Published by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### The Delbruck Motor-Tricycle Hill-climbing Gear.

Garnier, Nice, it was necessary to bring the motor almost to a standstill before attempting to change the gears. This was a slip of the pen, and we should have said that it was necessary that the speed of the motor-tricycle should be very considerably reduced before attempting to put the change gear into operation. When it is desired to place the slow speed into operation, the machine is of course mounting a hill, and the extra demand on the engine will necessarily reduce the speed automatically; it is at the precise moment when it is felt that the motor is called upon to do too much work that the slow speed gear should be put into operation, and, therefore, it is not actually necessary to reduce speed, as that is done by the demands upon the engine being excessive. In changing back to the high gear, the same state of things exists, as the slow gear having been in operation it is perfectly easy to throw in the higher speed gear. In fact, with a little practice it is possible to throw either gear into operation when travelling at from ten to twelve miles per hour, so that it will be seen that the necessity of "stopping" or slowing down the speed of the vehicle is only a relative expression. The great advantage of the Delbruck gear arises from the fact that it can be attached to or removed from the tricycle in about two minutes, and in addition there is no necessity for any change in the construction of the tricycle, or the gear wheels already fixed.

### The Motor-Omnibus Companies.

WE have reported in a previous issue that the London Steam Omnibus is proceeding quietly, but we hope surely, with its work, and endeavours to conquer the immense difficulties in constructing a vehicle to carry a large number of passengers at a fair speed on the London roads. We hear also that all threats of litigious proceedings are being quietly overcome, and that the Directors have secured some further valuable and very necessary concessions from the promoters which should enable them to face the shareholders with a much better programme than was originally laid down in the prospectus. All that is now needed is successful vehicles, and these, we understand, are well under construction. The other London Motor-Omnibus Company is apparently, however, in much the same state as it has existed since May, 1896. We cannot hear that the London Electric Omnibus Co. has made any progress in the construction of a workable electric omnibus. Shareholders are, of course, complaining bitterly, for apparently no satisfactory explanation is forthcoming as to the progress made in the experiments which were promised should be made. It will be remembered that at the last meeting the directors succeeded in getting rid of Mr. Ward, whose services were regarded by them as an incumbrance rather than a help;

but, so far as we can learn, the position of the Company does not happen to have advanced very materially since that time. Will the chairman or secretary favour us with a little information for publication?

### Sir William Bailey and Co., and Motor-Cars.

IN our last issue we gave currency to a report received from a Manchester representative, to the effect that the well-known firm of engineers, Sir William Bailey & Co., of Salford, had decided to take up the manufacture of motor-cars, and had, in fact, acquired new premises for this purpose. We now learn, however, that this is an error, and that the firm have at present no intention of taking the course indicated. As will be seen from other remarks in the present issue, the motor-car industry in Manchester is, however, flourishing "like a green bay tree," in fact, both the two great Lancashire cities are well to the front in taking up the study and employment of motor-vehicles.

### Motor-Vehicles in Cottonopolis.

ALTHOUGH we have this week to contradict the paragraph about Sir W. Bailey having taken extensive works for the manufacture of motors, yet another rumour we venture to repeat, *i.e.* a syndicate has taken an extensive plot of ground in Old Trafford Park for the erection of works, wherein to manufacture an entirely new form of motor. Colonel Pilkington, glass manufacturer, of St. Helen's, is reported to be the head of the syndicate. The above item is given as told to us and as being rumoured well about in Manchester. It is a fact, however, that Messrs. Simpson and Bodman, have taken new premises at Cornbrook, Manchester, and that these are being equipped with the latest tools for the manufacture of their steam-driven lorries. Messrs. Simpson & Bodman have been experimenting for nearly four years, and their vehicle, they are of opinion, is now commercially efficient. At all events, three of them will be entered for the Liverpool trials, and possibly, if time allows, one may be shown at the the Agricultural Hall Exhibition in July. Mr. Thornton, of the Thornton Motor Co., Ltd., has been experimenting for the last two years, and he is now having built a heavy oil driven lorry for the Liverpool trials. Possibly, if time permits, this may be seen first at our exhibition. The new works of the above Company consist of three floors of a warehouse of 3,000 square yards each floor, so that our readers can see that Manchester is very much alive to the importance of the new industry.

### An Irish Motor- Vehicle Match.

IT is reported in the Irish Press that a well-known Dublin physician, who is an enthusiastic believer in motor road-locomotion, has entered into a wager to run his car from Dublin to Galway, a distance of 135 miles, within a period of twelve hours. To an ordinary motor-carist this does not seem a very onerous task, but when the roads are taken into con-

sideration the task is more formidable than it at first appears. The roads are not only hilly, in fact *very* hilly, but like most Irish provincial roads they are in a very bad condition, the surfaces being loose and uneven, whilst in the valleys they are quagmires. Even at the best of times they are full of ruts, and tires and chains will have to stand a vast amount of strain. We are inclined to think that the doctor will, however, be able to win his wager, given that he has fair luck. The time allowed for the journey, twelve hours, is to include all stoppages, no matter for what purpose, and it is proposed that the contest shall take place during the coming month.

#### A Trip on a Benz Car.

ALTHOUGH last Saturday looked very gloomy in London we were very pleased to accept the invitation of Mr. Hewetson to have a run round the Surrey villages on one of his cars. We journeyed *via* Putney Bridge, Kingston, where we met Mr. and Mrs. Mulliner (Brook Street) on another Benz car, to Leatherhead, and then on to Effingham. At this pretty Surrey

village (at the Blucher Arms, a well-conducted hostelry) we met Mr. Frank Butler on his double-cylindrical Benz, and two other Benz cars. Afternoon tea was indulged in here, and then some photographs were taken, one of these being reproduced here. With Mr. Hewetson and Mr. Butler we journeyed on to Guildford for dinner, and during that meal a discussion as to the climbing capabilities of the two vehicles took place. This ended in a small bet, which was to be decided next morning, and the "Mount" was to be the *venue*.

#### The Mount, Guildford.

WE stayed at the White Lion Hotel, and after a capital breakfast visited Mr. Lowes for petrol, being there joined by Mr. and Mrs. Knight, residents in the town and owners of a Benz vehicle purchased from last year's exhibition at the Agricultural Hall. The arrangement of the wager was that each was to drive his car up the "Mount"—and Mr. Hewetson insisted on our riding up with him. We may mention that both cars are fitted with Crypto gears, and the one that mounted the hill is geared down very low. This car went up very well indeed—possibly two miles an hour—but the hill is one that it would be necessary to go a very long

way indeed to find its equal. In fact, we are of opinion it is about one of the stiffest in the country, and we arranged with Mr. Lowes to have the gradients taken by a surveyor, so that we can give the exact averages. To turn round at the top of the stiff part was risky work, but was accomplished, and we came down on the Crypto gear, without the use of any breaks. The second car did not try the experiment a second time.

#### Beyond Godalming.

AFTER negotiating the "Mount," we went on to Mr. Buttemer's house, about three miles beyond Godalming, but in the meantime the spring of our exhaust valve had broken, hence our progress was somewhat slow for the last half mile, but fortunately Mr. Buttemer, who owns a Benz car, had a pit, with planks over, so the defect was easily remedied. A long stay was made at our friend's house, and then we made, under Mr. Buttemer's guidance, a start for the lovely villages—beloved of painters—of Albany and Shiere. After visiting the Silent Pool, the claims of nature took us to the White Horse, at Shiere (an inn to be recommended), where we had a capital luncheon. The rain, which had been threatening for some time, here began, and shortly after four a start was made for home, the ride being in the teeth of a very unpleasant storm of rain, sleet, and hail. London was reached before dark, and a very pleasant time, notwithstanding the weather, was brought to an end. All the Benz cars ran splendidly, and gave little or no trouble (excepting the broken spring), and in conclusion we can only echo the remark of a young lady's admiration, "What a dear little motor."

#### A New Primary Cell.

WE alluded in a previous issue to the production of a new primary cell which had an E.M.F. of 2.45 volts. This battery is an American invention of Mr. J. D. Darling, who has acquired some very considerable reputation in America for his work in electro-chemical matters. We stated at the time of our first allusion to this battery that we were not sure that it would be suited for motor-vehicle work; but we now hear from the makers, Messrs. Harrison, Bros. & Co., of Philadelphia, that they have conducted experiments which prove that this battery is very highly efficient in igniting the charges of petroleum-spirit engines where the revolutions do not exceed 400 per minute. Further experiments are now being conducted with a view to prove its efficiency at a higher speed. The cell is not at present on the English market, but it is proposed to bring it to this country very shortly.

#### The Automobile Club's Whitsun Tour, and Club Dinners.

THROUGH a clerical error in the announcement sent to us by the Secretary of the Automobile Club, we last week reported that the Club's Saturday run to Frensham would take place on the 22nd inst. In a further communication from Mr. Johnson, we now learn that the date of this run will be Saturday the 29th inst. It is intended that the start shall take place from the Club at nine o'clock in the morning on that day, luncheon being served at Frensham, and the return to town being made on the same day. As we intimated in a previous issue the Club's Whitsun tour will be through Shakespeare's country. The party will start on Friday, May 19th, at 10.30 in the morning from the Club premises. The first day's journey is 56 miles, the destination being Oxford, and the route *via* Hyde Park, Ealing, Southall, Uxbridge, Beaconsfield, to High Wycombe, where lunch will be served at the "Red Lion" Hotel. Leaving High Wycombe the route continues *via* Stokenchurch, Wheatley, to Oxford, a club dinner being served in the evening. Saturday's run will total 53 miles, the destination being Leamington. The mid-day break will be made at Stratford-on-Avon, the route followed to this place being *via* Banbury,

Wroxton, and Ettington. An afternoon break will be made at Warwick, which will be reached *via* Longbridge, the club dinner being held at Leamington. On Whit Sunday an optional tour has been arranged from Leamington to Redditch, Alcester, and back. The route to Alcester will be *via* the Ridgeway, the route traversed being one of the most beautiful in the district, including, as it does, Warwick, Claydon, Henley-in-Arden, Ullenhall, Ipsley Court, to Redditch, through Headless Cross by the Ridgeway to Dunington, and thence to Alcester, where luncheon will be served. The return journey to Leamington will be made by Stratford-on-Avon and Warwick. On Whit Monday Leamington is still retained as the headquarters, and a trip is arranged to Stoneleigh, Kenilworth, Birmingham, Moseley and back. The departure from Leamington takes place at 9.30 in the morning, and it is proposed, subject to Lord Leigh's permission, to drive through Stoneleigh Park to Kenilworth, the route then proceeding *via* Leek Wootton, Guys Cliffe, and Warwick to Birmingham, where luncheon will be served at the Grand Hotel. The return to Leamington will be made *via* Moseley, where Mr. A. Bird has invited the party to afternoon tea. From Moseley the return to Leamington will be *via* Hockley, Rowington, Hatton, and Warwick. Tuesday's journey is rather an onerous one, the whole distance from Leamington to London, 94½ miles, having to be negotiated on this day. Luncheon will be served at Aylesbury, the route from Leamington to this town being *via* Southam and Banbury, and that from Aylesbury to London *via* Amersham, Uxbridge, and Ealing.

#### Press Reports on Motor-Vehicles.

WE have become so accustomed to finding ludicrous and utterly misleading reports concerning motor-vehicles in the daily newspapers that we no longer take any great notice of them. We see, however, that the Cycling Press of the country has latterly devoted considerable space to the doings in the world of automobilism, and to the credit of these journals generally it may be said that no undue exaggeration has been customary. A notable exception, however, occurs in the issue of the *Cycle* for the present week, where the following appears: "I heard many terrible tales as to the 'auto-cars in the direction of Salisbury and the New Forest. 'One enormous steam vehicle, carrying thirteen passengers 'at a speed of 20 miles an hour, or more on occasion, excited 'much unfavourable comment, says 'Montagnard' in the *Sporting Life*. It dashed about like a mediæval dragon 'belching forth fire, with three blazing lamps in front, 'calculated to make a blind bathing-machine horse jump the 'hedge and take to the country, and its pace downhill, 'especially near White Parish, was alarming." We can excuse a penny-a-line reporter for breaking out into such language as is here quoted, more especially when it occurs in such a paper as *Sporting Life*, but it is inexcusable for a journal like the *Cycle* to reproduce such utter rubbish without administering a correction to the contemporary from whose columns the remarks were "lifted."

#### The Morecambe and Lancaster Motor-Vehicle Service.

THERE has been quite a "storm in a tea-cup" over the licensing of the cars run by the Lancaster and Morecambe Motor-Car Co. between Lancaster and Morecambe. The Lancaster District Council had no hesitation in licensing the vehicles for service, but this is not the happy state of things in Morecambe. In the first place, the Morecambe District Council refuse altogether to license these vehicles, but the Hackney Carriage Committee received a renewed application from the Motor-Car Company, who desired to run their vehicles, if possible, during the Easter holidays. The Hackney Carriage Committee of this Council were, however, more complacent than was the Council as a whole, for it having been demonstrated to them by trial trips and otherwise, that it was perfectly safe to run these vehicles, they

granted a provisional license, whereupon at the next meeting of the District Council a Mr. Cryer very strongly objected to the Hackney Carriage Committee thus over-riding the decision of the Council. Mr. Cryer seems to have been well-named, for his "piteous cry" would move anyone less used to him than the Morecambe District Council to comply with his wishes out of sheer pity. Fortunately, however, the Council knows him well, and although it could not prevent him making complaint, yet, as a result, no attention was paid to it.

#### The Dunmore and Waterford Motor-Car Scheme.

WE understand that the projected motor-car service between Dunmore and Waterford has been further considered at a meeting of those concerned with gratifying results, notwithstanding the suggestion of one gentleman that a tramway service should in preference be substituted. It has been said that the traffic between Waterford and Dunmore is hardly sufficient to justify the expenditure which would be necessary to give an efficient service of motor-vehicles. If this be the case—we strongly doubt it—the traffic would certainly not warrant the considerably greater expense of laying down a tramway system, and we think, therefore, that the Mayor, Mr. I. C. Strange, and Alderman Goff, J.P., will be well advised to adhere to their original proposal of providing a motor-vehicle service.

#### Isle of Man and its Motor- Car Services.

THE Manx Cycle and Motor-Car Hiring Co., Ltd., have encountered very serious difficulties in gaining the necessary legal permission to run a motor-vehicle service in that ideal resort of summer tourists, the Isle of Man. The Bill legalising the use of motor-cars has now passed the House of Keys, but has to receive the additional sanction of the Upper House of Tynwald Court before it becomes law. After passing the Upper House the law is promulgated from Tynwald Hill, and as this cannot take place till July 5th, the motor-cars cannot legally be used in the island until after that date. Those visitors to the Isle of Man who have witnessed the promulgation of new laws from the Tynwald Hills will appreciate the attractiveness of this ancient custom. We hope that on July 5th next there will be a considerable number of motor-carists, together with their vehicles, in waiting to hear the announcement of the possibility of running motor-vehicles in the island and to form a parade through the district of St. Johns' to celebrate the occasion.

#### Torquay and Motor-Cars.

A CORRESPONDENT writing to the *Torquay Times* over the pseudonym of "Black Lion" writes as follows:—"Will you endeavour to convince the 'Town Council that the horrible abomination designated a 'motor-car' is a 'terrible nuisance to owners of carriages using the Torbay 'road. I have witnessed many narrow escapes, and have 'heard visitors complain loudly and bitterly of the authorities 'allowing such a noisy and ugly machine to frighten valuable 'horses. My own experience is that, although a large rate-payer, I am debarred from using our finest mile of road, 'and compelled to make a long detour, so as to avoid 'risking life and limb. If cabmen or cyclists rode at the 'same pace as this 'thrashing machine' occasionally 'travels, they would run a risk of being prosecuted 'for furious driving. Surely something can be done 'to stop further damage to Torquay carriage traffic." A finer example of selfishness could hardly be brought forward than the "Black Lion's" letter just quoted. In the present instance the "Black Lion" cannot be complaining of the vehicles of the London Motor Van & Wagon Co. Now, in the neighbourhood of Torquay there lives Mr. Eugene Paris Singer, who, is, we are sure, a larger landed proprietor

than "Black Lion," and probably also a heavier ratepayer. He, as is well known, is an enthusiastic motor-carist, having gained his experience in France and possessing quite a fleet of automobile vehicles. Possibly it may be one of this gentleman's carriages which has raised the "Black Lion's" ire, and so caused him to publicly demonstrate his selfishness. However this may be, "Black Lion" may rest quite assured that his strength is not sufficient to prevent the use of motor-vehicles even in conservative Torquay.

#### Trailing Cars for Motor-Tricycles.

SMALL trailing cars for attachment to De Dion and other motor-tricycles, giving accommodation for an additional rider, have for some time been very popular in France. A later development of the demand for additional seating accommodation on motor-tricycles is the introduction of an extra seat mounted on a pair of wheels intended to replace the single front wheel of the tricycle, so converting the latter into a two-seated quadricycle. One of the latest attachments of the latter kind to come under our notice is that which has lately been put on the market by the London Autocar Co., Ltd., 182 Gray's Inn Road, London, W.C. It comprises, as usual, a comfortable seat mounted on a pair of pneumatic-tired cycle wheels, with footboard, etc., the feature being the readiness with which it can be attached to a motor-tricycle. The connection between the rear axle of the tricycle and the new attachment is made by two long tubes, one on each side, pivoted at and braced by a cross strut about the centre, two clips and bolts being used to connect the tubes to lugs on the rear axle. The connection of the attachment to the tricycle is further strengthened by two stays—one each on the two longitudinal tubes—these two stays meeting just behind the head of the tricycle and being connected to the lower cross tube of the frame by a band-clip. A further stay also connects this cross-tube of the frame with the strut between the two longitudinal tubes. Every precaution is thus taken that the connection of the attachment to the tricycle shall be quite rigid and secure. The makers claim that the operation of converting a tricycle into a quadricycle, or *vice-versa*, can be performed in about ten minutes. The steering is effected through lever-rods connecting the front wheels with the lower ends of the front forks of the tricycle. The weight of the attachment is stated to be about 25 lbs. The front seat is neatly upholstered, and is provided with a back rest, so forming a comfortable seat for a lady rider. There must be many motor-cyclists anxious to enable a friend to participate in the pleasures of "motoring," and to such the London Autocar Co.'s attachment should be just the thing wanted.

#### The Willington Quay District Council and Motor-Vehicles.

THE Willington Quay District Council have had under consideration the providing of motor scavenger vans for some time. They have investigated several types of cars, including those made by Messrs. Thornycroft, of Chiswick, and the Committee entrusted with the report have stated that, as a result of their investigations, they found that one car could do the work of three horses. The consideration of the report is deferred until the next meeting of the Council in the coming month, when additional information is to be obtained, and a decision as to the provision of these vehicles finally determined.

#### A Warning from Gloucester.

THOSE automobilists who may be in the vicinity of Gloucester city and in want of motor-car spirit will, we are sure, be glad to learn that they can obtain supplies from Mr. J. Wilson Taylor, of Blackfriars Lawn. Mr. Taylor writes to us and would very kindly warn automobilists to moderate their speed when approaching or going

through Gloucester. He tells us that he himself has been summoned three times for, as he puts it, *supposed* furious driving, and therefore, like a good *confrère*, desires to prevent his brother automobilists from having to undergo similar experiences. If any others of our readers know of districts where the authorities are prone to exaggerate the speed of automobile vehicles, we shall be glad to receive information from them with a view to its publication in these columns.

#### The Sunderland Motor-Car Service.

SUNDERLAND'S motor-car service is proving so eminently successful that the Syndicate controlling it hardly knows what to do pending the arrival of the five additional cars now on order, and the four to be subsequently put in hand. Originally only one car was running in the West-end of Sunderland, and the service ceased at eight o'clock at night. Now, however, there are two carriages traversing the Holmeside and Chester Road district, and so great is the public demand for these conveyances that the service is continued until eleven o'clock at night. Another service that has been started is between Sunderland and Silksworth. Other services are projected between the Wear-side borough and South Shields, and another between Tynemouth and Blyth.

GUILDFORD is becoming quite a centre for motor-carists, and therefore it is only natural that an enterprising inhabitant—Mr. Laures—should lay himself out for the catering of *chauffeurs* by having qualified assistants to act as repairers in case of breakdowns. Mr. Laures, of the Guildford Motor-Car Agency Co., stocks petrol, and has erected a platform for cars to run up, so that it is possible to do repairs underneath the car with tolerable comfort.

#### MOTOR TRICYCLIST IN TROUBLE.

George Iden, manager of the Motor Manufacturing Company, Coventry, was summoned at the City Police Court, on the 7th inst., for furiously driving a motor-tricycle at Allesley, and also with refusing to stop when requested by a constable. Police-constable Vale stated that defendant was going at the rate of from twenty to twenty-five miles per hour on the Birmingham Road, and that he refused to stop; in fact, when a signal was given, "he put on speed and disappeared out of sight." Samuel Anthoney, landlord of the Rainbow Inn, also gave evidence. Defendant, William H. Thomas, John W. Betting, Peter Binns, and William Wilmshurst all gave evidence against the information of the police; but the magistrate convicted, fining Mr. Iden £5 and costs for the furious driving, and ordered him to pay expenses for refusing to stop.

#### FURIOUS "MOTORING."

At the Guildford Borough Bench, on Wednesday last week, Daniel Michael Weigel, residing at 25 Manilla Gardens, Notting Hill, was summoned for driving a motor-tricycle along the Portsmouth Road on Good Friday at greater speed than was reasonable, and having proper regard to the traffic. There was also a second summons against the defendant, which alleged that he was driving his machine to the common danger of the public. Jas. Glenny Gibb, of 51 Ladbroke Grove, Notting Hill, was summoned for riding a bicycle to the common danger of the public at the same time and place. P.C. Nicolas said that the defendants came along at a terrific rate—fully eighteen to twenty miles an hour. He called upon them to stop, but they did their best to get out of his way, and would have escaped had there not been several vehicles about. Sub-Divisional-Inspector West said there were four other witnesses in court who would prove that the defendants were travelling at the same speed right away from Richmond Park to the Portsmouth Road. It was one of the worst cases they had ever had in the borough. A young man who appeared on behalf of Weigel said that he was instructed to plead guilty, but Gibb urged that the constable was mistaken in his judgment of the pace. Alderman F. Gould, the presiding magistrate, said that the motor-tricycle was a new difficulty which the Bench would have to deal with. In the case of Weigel, the Bench would inflict a fine of 20s. on each summons and costs, amounting altogether to £3 14s.; and in the second case the defendant would have to pay £1 13s., including costs.

## The New "Orient Express" Motor-Carriage.

THE AUTOMOBILE ASSOCIATION'S NEW "ORIENT EXPRESS."

WE illustrate herewith the latest form of the new "Orient Express" vehicles made for the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, London, W., by Bergmann's Industriewerke, of Gaggenau, Baden, Germany. This vehicle is a considerable improvement on anything yet constructed by the Company and sent to their English agents. This carriage, in fact, contains all the latest improvements suggested by the experiments of the firm during the last two years. It is provided with a 4-h.p. single cylinder horizontal petroleum-spirit motor, the explosive gases being ignited by a spark obtained from an improved form of Bosch Magneto-Electric device. The cylinder of the engine is water-jacketed, the water circulating on the thermo-syphon system, a condensor also being employed. The carburetting device fitted to this car is a great improvement on those hitherto used. The makers now utilise the hot circulating water to vapourise the spirituous charge, a pipe leading from the carburettor through the tank conveying the cooling water, and from thence to the engine. Three forward speeds and one backward motion are provided. The vehicle is belt driven, four pulleys being provided on the crank shaft, each connected by a separate belt to corresponding pulleys on an intermediary shaft at the rear. The belts normally run slack, but it is possible to tighten any one of them by means of a jockey-pulley, which, carried on a

travelling carriage, can be made to put either belt in tension as desired. The intermediary shaft carries the differential gear, the rear road wheels being driven by pitch chains through the usual sprocket-wheel devices. We are informed by the Automobile Association that the hill climbing properties of this car are very great, it having mounted that terrible incline at Campden Hill Gardens on second speed. All the steering and control levers are conveniently placed, and the control of the car is instantaneously at the command of the driver. The price of the vehicle is very low, and we imagine this carriage will meet with a ready sale and fulfil the popular demand for a light carriage at a low price.

THE construction of motor-tricycles is being taken up by Messrs. Hoyer & Geahin, of the "Welt-Rad" Cycle Works, Schönebeck-am-Elbe, Germany.

WE are constantly receiving additional names of vendors of motor-car spirit, and we are always glad to chronicle these, as we know the difficulties and unpleasantness of being in a district without spirit, and not knowing to whom to apply. Automobilists visiting Reigate will, in future, be able to obtain supplies from Messrs. T. S. Marriage & Co., of Bell Street, Reigate, who inform us that they now keep a large stock in hand.

## MOTOR-CARS ON THE CONTINENT.

### The Automobile Club of France.

THE Exhibition Committee of the French Automobile Club have their work fully cut out in finding room for the numerous firms who are desirous of securing space at the Club's forthcoming Exhibition in the Tuileries Gardens. As showing, in some measure, the demands for space, it may be noted that on April 11th, 1898, ninety-two firms had secured space for the Exhibition of that year, their united demands totalling 2,717 square metres, whereas on April 11th of this year no fewer than 170 exhibitors had made application for space amounting to 5,876 square metres. In face of strenuous opposition, the authorities have at length decided to grant the request of the Committee for extending the Exhibition space in the Tuileries Gardens, but even with this extension M. Gustave Rives, the energetic Director-General, will have some considerable difficulty in adequately meeting the demands of the firms applying for space.

### Sir David Salomons in France.

SIR DAVID SALOMONS is perhaps the only Englishman interested in the automobile movement, who can lay claim to be in a position to influence the Automobile Club of France and to possess any great power amongst the enthusiastic automobilists of that country. As in England, so in France, Sir David Salomons' name is to be found on all the leading committees and organizations interested in motor vehicles. He is, we believe, a member of the committee of the Automobile Club of France, and also possesses a seat on the executive body entrusted with the management of the forthcoming Exhibition of the French Automobile Club. Recently Sir David Salomons presented the Automobile Club with a magnificent silver gilt trophy, and during the past week his many services to the Club were duly acknowledged by the presentation to him of a large and handsomely designed medal.

### The Motor-Tricycle Contest.

IN addition to the names announced as having been entered in the Criterion for motor-cycles over a distance of 100 kilometres the following four additional entries have been made: Albert le Carpentier, Rolland, Ernest Roguet, and Demescer. The race was held on the 18th inst., and just as we go to press we learn that the winners were as follows:—1st, M. Teste; 2nd, M. Tart; 3rd, M. Osmont; and 4th, M. Bardin. M. Teste accomplished the 100 kilometres without accident in 1 h. 52 m., or about 5 m. less time than was occupied by Monsieur Leon Bollée in 1898. It is interesting to note the time variations for the years in which the contest has been run. In 1897 the winner's time was 3 h. 9 m. 15½ s.; in 1898, 1 h. 57 m. 49½ s.; and in 1899, 1 h. 52 m. The speed on the present occasion was thus over 33½ miles per hour for the whole 62½ miles.

### France Copies America.

WE have become so accustomed to the idea that France leads in everything connected with the automobile industry that it comes somewhat as a shock to find that in one branch of this industry they are following the example of America, who has generally been regarded as being in the background in matters automobile. We chronicled some weeks ago the presentation to a certain hospital of a motor-ambulance by a prominent citizen of a great American city. It appears, however, that France, now inflamed by this example, proposes to establish a motor-ambulance service in connection with the many road races which are held within its borders. The Paris Chateaudun bicycle race is set down for competition on June 11th next, and the first experiment

with these automobile-ambulances will be made on that occasion. It is intended that the ambulance shall start half an hour after the contestants have been sent on their journey. It will carry medicaments for the treating of any injuries suffered by the animate contestants, and in addition a kit of tools for effecting repairs to the inanimate contestants—namely, the cycles. It is anticipated that as a means of repairing both human and mechanical injuries the motor-ambulance will prove extremely valuable, and in view of the serious accidents which have happened to the animate contestants there is doubtless some field of utility for such a vehicle, provided of course that it does not itself break down and need the services of another ambulance to set it going again.

### Public Motor-Vehicle Services in France.

THE Société des Automobiles du Sud-Ouest has just applied to the Prefect of the Charente Department of France for permission to establish no less than fifteen separate services of automobile vehicles for conveying passengers and baggage in that district. It is proposed that the old services of diligences or stage-coaches shall be considerably augmented by means of these motor-vehicle services. The diligences are almost prehistoric in design, are drawn by wretchedly bad horses, and the time occupied on their journey is the cause of considerable inconvenience, and moreover the service is by no means sufficiently frequent to meet public wants. The routes suggested are: (1) From Barbezieux to Angoulême, via Blanzac; (2) from Barbezieux to Chalais, via Brossac; (3) from Barbezieux to Montendre, via Baignes; (4) from Barbezieux to Cognac, via Segonzac or via Criteuil and Saint-Fort; (5) from Archiac to Aigre, via Segonzac, Jarnac, and Rouillac; (6) from Aigre to Ruffec, via Tusson and Courcôme; (7) from Ruffec to Confolens, via Champagne; (8) from Confolens to Saint-Junien, via Brigueil; (9) from Aigre to Saint-Angeau, via Mansle; (10) from Saint-Angeau to Angoulême, via Champniers; (11) from Angoulême to Garrat; (12) from Angoulême to Ecuras, via Montbron; (13) from Mansle to Angoulême; (14) from Cognac to Pons; and (15) Cognac to Matha. The vehicles intended for these services will run at an average speed of from 15 to 18 kilometres per hour, and will carry from 20 to 30 passengers with a corresponding amount of baggage.

### The State Regulation of Motor-Vehicles in France.

THE *Journal Officiel* has published a decree signed by the President of the French Republic, which embodies regulations designed to control the circulation of self-propelled vehicles on the public roads in France. This document contains many precise and detailed sections regulating the speed, the passing, the driving, and the controlling of vehicles, and the formalities to be carried out before putting on the roads any carriage for public hire or otherwise. With the exception of speed regulations to which reference has been made in previous issues of this *Journal*, there is nothing, however, of any very considerable interest to *chauffeurs*. The speed regulations are certainly somewhat severe in view of the pace at which it has been customary for such vehicles to traverse even the roads of large towns, but we fear that these regulations will not have any very deterrent effect upon the French *chauffeurs*, for the reason that, with the means at their disposal, the Government will find it extremely difficult to enforce the regulations.

### The Pau-Bayonne-Pau Road Contest.

THIS contest, which was organized by the Automobile Club, Bearnais, has resulted in a very interesting competition, the weather being magnificent, and the whole of the 24 competitors leaving in good time at half-minute intervals. The contestants left in the following order: A. Lemaitre (two-seated carriage), Etienne Giraud (two-seated carriage),

Gras (two-seated carriage), Rigal (motor-tricycle), Béconnais (motor-tricycle), Vasseur (motor-tricycle), Boyer (voiturette), Duanip (motor-tricycle), Pascault (six-seated carriage), Debacker (motor-tricycle), Renouille (four-seated carriage), Merle (voiturette), Géo (motor-tricycle), Comte de Galiffet (four-seated carriage), Barbereau-Bergeon (four-seated carriage), Cuzac, Jaudet, Magendie (all motor-tricycles), Menjou (six-seated carriage), Couderc (motor-tricycle), Laffitte (six-seated carriage), Dumoulin, Joyeux, Labadie (all motor-tricycles). It was prophesied before the race that Monsieur Lemaître on his 18-h.p. Peugeot carriage would certainly prove to be the winner. Before the contestants started Monsieur De Thorn, the President of the Automobile Club Bearnais, and Count Nitot conveyed the Prefect of the Basses-Pyrenees, the Mayor of Pau, and several other guests to an advantageous spot on the route. The first breakdown occurred very soon after the start, when Giraud had to give up and return, his power-transmission device having broken down. At the termination of the run to Bayonne, Lemaître was actually first at 11.45, having covered 103 kilometers in 2 h. 20 m. Rigal, on his motor-tricycle, was the next to arrive at 11.47½, having completed the distance from Pau at an average rate of 53 kilometres per hour. According to the compensation time allowances, however, Rigal was credited with doing the 103 kilometers in 1 h. 58 m., which beats all previous records either on track or road, and, in addition, surpassed Lemaître's time by 18 seconds. Rigal, however, had evidently over-exerted himself, for after completing the 103 kilometres and reaching Bayonne he was compelled to give up the contest owing to inability to traverse any further distance. Monsieur Lemaître arrived back at Pau at 2.27½ p.m. If all time allowances for stoppages are taken into consideration we find that Monsieur Lemaître's record for the whole journey of 206 kilometres comes out at an average of 52.2 kilometres per hour. Rigal having retired, Monsieur Vasseur was the second back to Pau and the first of the motor-tricyclists, arriving at 2.55½ p.m. his average speed for the whole journey being 47 kilometres 340 per hour. The net times of the various classes of vehicles were ultimately pronounced as follows, all time allowances for stoppages and passage through neutral zones being taken into consideration:—Two-seated carriages—first, Lemaître, 3 h. 52 m. 56 s.; second, Gras, 4 h. 42 m. 55 s. Motor tricyclists—first, Vasseur, 4 h. 21 m. 20 s.; second, Béconnais, 4 h. 54 m. 30 s. Touring motor-cycles—first, Couderc, 5 h. 15 m. 55 s.; second, Dumoulin, 6 h. 35 m. 50 s. Four-seated carriages—first, Barbereau-Bergeon, 4 h. 49 m. 20 s.; second, Renauille, 7 h. 21 m. 50 sec. Six-seated carriages—first, Pascault, 7 h. 38 m. 10 s. Voiturettes—first, Merle, 8 h. 18 m. 20 s. Messieurs Lemaître, Gras, Barbereau-Bergeon, and Couderc divided the special prizes offered by Michelin to those contestants who proved to be winners and users of his tires.

#### The Alcohol Competition.

The competition for vehicles propelled by motors actuated by alcohol, which was designed to take place on Tuesday in last week was anything but successful. The weather was execrable and the roads were extremely heavy, so much so that most of the competitors, eleven in number, declined to start. As a matter of fact, only one vehicle went over the course. This was entered by Mons. Geuttin & Co., and constructed by Messrs. Briest and Armand, of Villers-Cotterets. This vehicle started at 10 o'clock in the morning, steered by a Monsieur Briest, who had secured the attendance of a good-willed observer, Monsieur Bibollet, who was clothed in sufficiently impermeable garments to warrant his facing such a storm as was in progress. The carriage reached Chantilly at ten minutes past two, running 68 kilometres in 4 h. 8 m., and consuming 19 litres of alcohol. It accomplished the return journey in 4 h., consuming also 19 litres of alcohol. The 136 kilometres was effected in 8 h. 8 m., the average speed therefore being 17 kilometres per hour.

The commission entrusted with the drawing up of the report is hopeful that alcohol may ultimately be used with advantage for automobile vehicles, but we cannot hold the same opinion in face of various experiments conducted, all of which have resulted in but very ordinary performances.

#### The Turin-Pignerol-Turin Competition.

We have previously announced that the Automobile Club of Turin has organized a contest for carriages and motor-tricycles over a course of 90 kilometres, the route being as follows:—Turin, Orbassano, Piossasco, Pignerol, Trana, Avigliana, Rivoli, and so back to Turin. The contest is open to three classes of vehicles, namely, (A) motor-tricycles carrying one person, (B) motor-tricycles carrying two persons, and (C) three-seated carriages and vehicles of other classes. Arrangements have been made so that in case of inclement weather on the day set out for the contest the race will be deferred until the following day.

#### Automobile Excursions in France.

Automobile excursions, as arranged by the clubs, are becoming more popular every day in France. Among the latest clubs who have organized these pleasure tours is the Bourguignon Automobile Club, an excursion having been planned over a short 100 kilometres course between Dijon, Dôle, and back to Dijon.

### SCOTTISH NOTES.

#### Motor-Cars and the Holidays.

WITH the advent of Spring has come the commencement of the "local holiday" season in almost every town and district of Scotland. In many places these "days of rest" for the tired shopkeepers arrive regularly once a month, and I have been much struck with the enormous demand which I understand has been manifested during the past fortnight for motor-carriages for these occasions. The demand has exceeded the supply many times over. In Edinburgh, for instance, on Monday last every available motor-car in the city was brought into requisition, and even this did not prevent disappointment to many who had been looking forward to spending the spring holiday on a motor-car. Last year at the same time I believe the demand was not nearly so marked. The improvement now apparent is only natural, and is but another hint of the trend of public opinion and public taste. A word to the wise jobmaster should be sufficient. The people now want motor-vehicles, and of course will go where they can get them. I am not of those super-sanguine people who believe that very shortly we must witness the *exit* of the useful cab horse. For a long time to come the provincial jobmaster will not seriously suffer from the competition of the mechanical carriage, but suffer he inevitably will if he does not move forward with the progress of the times by the gradual assimilation of the two businesses. He has already much capital in live and rolling stock, and it would be ruinous to immediately convert his business into a motor-car hiring establishment; but apart from this it is not at present possible to obtain motor-vehicles in all the varied forms which his business requires, and until that time his broughams, cabs, landaus, etc., will not be unprofitable stock. But the time will come when satisfactory motor-vehicles of every form will be obtainable, and these capable of doing good and economical work. In view of that time I cannot impress too strongly upon the leading jobmasters of Scotland the importance to themselves of early identifying themselves with the mechanical carriage, and if possible introducing one or more types without delay into their business. By doing so I think they will prevent the formation of firms and companies with ample capital, having for

their object the introduction of motor-cars in so many suitable parts of the country—concerns which must by and by threaten the very existence of the jobmaster's business.

#### Edinburgh and Glasgow.

EDINBURGH rightly or wrongly has been and is regarded as a highly conservative city, and in certain respects it may be rightly so regarded. So far as the innovation in the form of the mechanical carriage, however, is concerned it is unmistakably an error. Glasgow, on the other hand, is not usually looked upon as a short-sighted or conservative community, yet in relation to the motor-car it has up till now been peculiarly inert and unsympathetic, for I am informed on undoubted authority that for every motor-car in Glasgow Edinburgh possesses *ten*. This is scarcely as it should be, and appears almost inexplicable. I have heard one theory advanced in explanation of this state of things. I give it for what it is worth—viz., that Glasgow has been waiting for the production of a certain new motor which has well-known and influential names attached to it and which has been promised for some some two years past, and is still to materialize. If there is really anything in the suggestion, which I am inclined to doubt, one cannot but admire the patience of the citizens of the Second City. In spite of this apparent lethargy in the commercial capital the use of the motor-vehicle in Scotland is extending at a more rapid rate than two years ago it would have been considered possible at so early a date.

#### Motors at the Coast.

THERE promises to be no falling off in the number of motor-cars at Scotland's popular seaside resorts this year. The Glasgow and West of Scotland Company have started operations again at Ayr with a regular service between the Station and Burn's Cottage and Monument. The cars on this route last year did good work and were well patronised. At both Dunoon and Rothesay, I understand, cars will again be in evidence, and I believe that so soon as a supply of steam omnibuses and *char-a-bancs* to carry at least twenty persons, such as I understand Messrs. Stirling, of Hamilton, have at present under construction can be obtained, many other tourist routes will be served.

#### On the Queensferry Road.

SATURDAY last brought us weather in the shape of a hurricane of wind and dust, and cyclists on the Queensferry Road in making their return journal Edinburgh-wards had a rough time of it. They certainly had to pay dearly for their pleasure on the outward "spin" with the gale astern. Among the usual crowd of "pedalists" I observed two motor-vehicles, one a De Dion quadricycle, the other the elegant Stirling-Daimler of Messrs. Rossleigh, Ltd. I could not help noting the immense advantages in having the assistance of a motor under such circumstances; the manner in which the mechanical vehicles sailed away, apparently indifferent to the wind, was instructive. The cyclists evidently appreciated them, for they endeavoured to hang on by every means in their power.

#### A New Car.

I OBSERVED early this week Mr. James Burns, the popular Town Clerk of the Burgh of Motherwell, driving an elegant new Daimler wagonette. I have since learned that the occasion was the "trial trip" of a new carriage just delivered to him by Messrs. Stirling. The carriage was a commodious and comfortable one, finished in dark blue, with yellow under-carriage and wheels.

"BROWN HEATHER."

## CORRESPONDENCE.

### THE SPEED OF MR. WRIDGWAY'S TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a letter from Messrs. Pennington & Baines in your last issue in which they seem to infer that because Mr. Wridgway claims that he could ride 33 miles an hour on the road, their car can beat his tricycle, and that therefore their car is able to go well over 33 miles per hour; but, curiously enough, to back up this statement they refer to the fact that Mr. Wridgway has just attained on a prepared cement track a little over 29 miles in the hour. This may be nice reasoning for Messrs. Pennington & Baines, but I happen to know a fact about the matter which rather weakens it, for the simple reason that Mr. Wridgway, to ride this race in question, borrowed a tricycle from Mr. S. F. Edge, which tricycle I also know for a fact will not do anything like 33 miles in the hour on the road.

Now why should Mr. Wridgway want to borrow what he evidently considers a faster tricycle if his own will do so much better?

Yours truly,

H. G. NORRIS.

P.S.—I know someone in London who has a motor-car, which I am quite prepared to say would beat Mr. Wridgway on the track any time that he thought he could compete.

### ELECTRICAL MOTOR-CARRIAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There seem to be many obstacles to the ultimate firm establishment, apparently inseparable from its early life, of a new industry, such as the adverse state of the law, the over-sanguine inventor, and the wiles of the professional company promoter, that those who are most interested in the matter, and one like myself, who has largely contributed to the years of labour necessary in making the electrical vehicles a practical success, have become hardened and take all these things as a matter of course, and bear the load without cavil. But when a gentleman of the standing of Sir David Salomons states (assuming that he has been correctly reported in the *Royal Magazine* of this month) that the electrically-propelled carriage is an impossibility, it is to be pardoned if the remark is not allowed to pass unchallenged. One is almost inclined to think that such a remark was made without due consideration, as was the case when the same gentleman, in estimating the cost of propulsion by electricity a year or so ago, based his calculations on the cost of electric current at fourpence per unit, whereas at that very time it was to be obtained in London at one penny per unit!

That one does not see many self-propelled carriages on the streets in this country is not evidence that they are unpractical. Our natural caution in adopting new ideas and our love of horses are enough to account for this—although, as a lover of horses myself, one of the last uses I would put a horse to would be the hauling of a tramcar or an omnibus, for I think that many of the horses one sees in cabs are fit subjects for anyone's compassion, and the sooner their use is rendered unnecessary by the introduction of electricity the better.

In spite of the long start which the automobile movement has had on the Continent, and in view of the fact that it is only during the last two years or so that one was allowed to run a motor-vehicle on the streets here at all, it is a very significant fact that the principal systems of electrical-vehicles which have been adopted in Paris are of English origin.

When discussing the "inutility" (*sic*) of electrical motors, Sir David is reported to have used the argument that "it is as if one should go for a fast drive and expect the horses to gallop along with a load of passengers as well as a dozen sacks of coal." Such an argument, if it can be so

termed, is not to the point, and one is tempted to remark that the horses would go very fast indeed if they had no load at all to carry. But why Sir David should try to prove the matter by wishing to carry accumulators (represented by the sacks of coal) in a horse-drawn vehicle, I fail to understand, for when we carry a set of accumulators in our electrical-vehicle we do not want to carry a horse, but do without them.

In conclusion, I can only say that regarding the weight of an electrical carriage, it is now quite possible to produce one capable of carrying two persons for a forty-mile journey, the total weight of the carriage being under 12 cwt., at a cost for electric current of two shillings (2s.), and an annual expense for renewal of accumulators of £20.

Thanking you for your courtesy in inserting this letter, and apologising for taking up so much of your valuable space,

I remain, dear Sir, yours truly,

The Automobile Club, S.W., C. OPPERMAN.

April 17th, 1899.

## ELECTRICAL CABS AND THE TAXAMETER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been called to a prominent paragraph in your issue of the 14th inst., in which it is stated that it has been announced in the daily papers that on the reappearance of the electric cabs they would be provided with taximeters. It is further stated that you had been informed by Mr. Bersey, the chairman of the Electric Cab Company, that there is no present intention of fitting these appliances on the Company's vehicles.

Such a *dementi* conveys the injurious impression that our Syndicate have made an inaccurate communication to the Press, and this being so I feel sure you will give me an opportunity of correcting this damaging impression.

In our chairman's communication to the Press, of which I enclose copy,\* what he stated was that forty cabs would be placed on the streets at the end of the week "in addition to forty of the electric cabs which the Cab Union had fondly imagined had disappeared, and for which we have been asked to reserve taximeters."

To prove that my statement was perfectly correct I enclose copy of my circular to the Press, and also copy of Mr. Bersey's letter dated February 22nd, which runs as follows:—

"I duly received your telegram of yesterday, and beg to inform you that we accept the terms arranged between us for the hire of the forty taximeters.

"In course of a few days I will forward draft agreement for signature, but in the meantime please note that we have decided to use your taximeters; please keep the same at our disposal."

"(Signed) W. C. BERSEY."

I may add that since that letter we have had no communication from the Electrical Cab Company withdrawing from their contract.

I feel sure I may rely upon your publishing this explanation of a misstatement, which I venture to think should not have appeared without further reference to us, and which otherwise will certainly be very damaging to our Syndicate.

London, W.C.,

Yours truly,

April 17th, 1899.

C. HARRINGTON MOORE,

*Managing Director the Taximeter Syndicate.*

[In correcting the error appearing in the columns of our contemporaries we had no intention of imputing that the Taximeter Syndicate had given the Press incorrect information. Nor, while still maintaining, on the authority of the chairman of the Electrical Cab Co., Ltd., that there is no present intention of equipping the electric cabs with the taximeter on their reappearance in the London streets on May 1st, do we now seek to imply that the statements made by our present correspondent are incorrect. We simply adhere to our correction, made on the authority already quoted.—ED. M.-C. J.]

\* This has no present interest.—ED. M.-C. J.

## MORS v. PENNINGTON.

SIR,—Eight weeks ago we issued a challenge to prove that our "Mors" was the fastest car in this country. Immediately Messrs. Pennington & Baines issued another challenge to go 100 times up Richmond Hill. We accepted it. In reply to this Messrs. Pennington & Baines issued another challenge to race us in France for 500 miles. Again we accepted, and again Messrs. Pennington & Baines have issued a new challenge—this time to go 25 times up the Shapfell.

Again we accept,

But for the last time.

THE AUTOMOBILE ASSOCIATION LIMITED.

P.S.—Since writing the above we have received a letter from a client who purchased one of our cars in August last, who has expressed his desire to witness and follow on his car the hill-climbing contest, thus acting as observer. He suggests that one of Messrs. Pennington's numerous customers will be equally interested to do so.

## THE BOLLÉE VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you kindly explain *how* the placing of the exhaust valve at the top instead of at the bottom of the cylinder in the later patterns of the above car is prejudicial to its successful running?

The fitting of springs seems to be a revival of an old idea, as the earlier pictures of the Bollée show it fitted not only with springs in front but at the rear of the frame also.

Have any of your readers tried the form of this car as modified by the Coventry Motor Co. and fitted with a Turrell motor—now being made by Messrs. Humber? I have been running one for over a week, and I do not want a nicer working little vehicle. It seems to me to be a very fair solution of the "voiturette" problem at present, and, to my mind, has the great advantage in appearance of being eminently "unhorseless"-looking.

This car has (up to the present!) given me all the fun of a Bollée, and at the same time runs, for a small carriage, with extreme quietness. It is also beautifully turned out and finished—which many are not.

Galway, April 18th, 1899.

C. P. DAWSON.

[The placing of the exhaust valve at the top of the explosion chamber is, in our opinion, an error, in that being so placed, it is necessarily receiving not only the ascending heat from combustion of the explosive charge, but, further, receives the ascending heat from the burner employed to heat the firing tube and the whole of the ascending heat radiated from the walls of the combustion chamber and cylinder. Moreover, the 3-h.p. Bollée voiturettes furnished with exhaust valves on top, as seen in this country, appear to be wrongly designed, inasmuch as the exhaust ports and valves in these 3-h.p. engines are smaller than was the case in the old type of 1½-h.p. engines. The diameter of the cylinder and the length of stroke are both increased, and consequently the charge of explosive mixture drawn in is also increased in quantity. Yet, this being the case, actually less room is provided for the exit of the products of combustion! The main cause of the failure of the Bollées with top exhaust valves lies, in our opinion, in imperfect design; but we are also in doubt whether, if properly designed, the exhaust valve would act so well when placed at the top as if placed at the bottom. We believe that both the French makers have now returned to the practice of putting the exhaust valve in its old position at the bottom of the explosion chamber.—ED. M.-C. J.]

THE Consolidated Street Car Co. have been incorporated in New Jersey, U.S.A., for the manufacture of street railway cars, automobiles, omnibuses, and other vehicles for the transportation of freight, as well as passengers, with a capital stock of 18,000,000 dols.

# A Steam Motor=Carriage of Thirty Years Ago.

A STEAM MOTOR-CARRIAGE OF THIRTY YEARS AGO.

**I**N the engraving herewith is illustrated an interesting example of a steam motor-vehicle which was built about thirty-four years ago—in 1865—by Messrs. T. Cooke & Sons, of York, to the order of a private gentleman. This was in fact one of three very similar carriages built at about this period, two of them being engined by Messrs. T. Cooke and Sons, and the other having a Shand & Mason engine and boiler.

It is interesting to note that constructors at that period had not conquered the inherent difficulties accompanying the steering of a four-wheeled vehicle, and that the three-wheeled type of under-carriage was adopted in order to avoid these difficulties.

The vehicle is reputed to have travelled exceedingly well, attaining an average speed of twenty miles per hour on some occasions, but more ordinarily accomplishing ten miles per hour as an average, including stoppages for water and fuel. Its capacity in fuel was twenty miles, but it could travel no more than ten without a fresh supply of water. The utmost seating capacity was fifteen persons, and it is said that this number was very frequently carried. On the front seat three persons were accommodated, six were seated back to back, jaunting-car fashion, behind the front seat, whilst further to the rear the vehicle took a wagonette form, four persons being accommodated in this portion, each seat furnishing room for two

persons. At the rear two seats were provided on the stoking platform.

The coal bunkers were placed on each side of the boiler, and extended forward under the seats of the wagonette portion of the vehicle. Water was carried in front of the vehicle in a tank, over which the seats of the jaunting-car section of the carriage were placed. The boiler was of the multitubular type, and the ordinary working pressure was 80 lbs., although when hills had to be negotiated it was customary to carry a steam pressure of 100 lbs. Twenty-five minutes were occupied in getting up steam from cold water. The engines had cylinders of 5 inches diameter, the piston stroke being 6 inches. Spur-wheel speed reducing gear was employed, the engine being geared to the road driving wheels in the proportion of 3 to 1.

The carriage was controlled, excepting the stoking and boiler replenishing, from the front seat, the driver having complete control as to stopping, starting, or reversing the engines. The total weight of the carriage, with fuel and water on board, was about 2½ tons, or probably a trifle more.

The carriage is no longer in existence, the boilers and engines having been removed, after the vehicle had run for several years, and subsequently placed in a launch.

The carriage is an interesting one, contributing as it does another example of former practice in invariably placing the

engine and boiler at the rear of the vehicle, instead of in front, as is the present practice in heavy steam vehicles. We are indebted to a valued subscriber for the loan of the photograph from which our engraving is reproduced, and for the foregoing particulars. We will gladly welcome the receipt of any particulars or illustrations of interesting old-time vehicles, and in the event of readers entrusting them to our care, will readily undertake that they shall suffer no injury whilst in our charge.

## SOME NEW PETROLEUM-SPIRIT MOTORS FOR MOTOR-TRICYCLES—I.

IN consequence of the increasing popularity of motor-tricycles in France, quite a number of firms in that country have laid themselves out to meet the demand for the same. Many of these firms are employing the well-known De Dion motor, but during the past few months several small motors of the same type, but which are claimed to possess certain advantages over their older prototype, have been put on the market. Among these is the Société des Moteurs "Cosmos," of 67 Rue de Provence, Paris, whose motor—the "Cosmos"—we are now able to illustrate in Fig. 1 and Fig. 2, and describe. The motor, which is of the single-cylinder vertical type, is built up of three main parts, each entirely distinct from the other—*B*, the valve and explosion chambers; *F*, the cylinder proper; and *H*, the oil-containing dust-proof casing in which work the piston-rod *D* and crank-disc *L*. The cylinder *F* is a casting of special homogeneous iron, the outside and inside being both machined to remove any inequalities, the outside being provided with a series of ribs running lengthwise with the cylinder, forming, as it were, a very wide spur wheel. The ribs or ridges of the

FIG. 1.—GENERAL VIEW OF "COSMOS" MOTOR.

cylinder barrel are entirely enclosed, except for a short space at the top and bottom, by a heat-absorbing polished copper jacket *G*. The makers claim that the openings to the space between the ribs thus formed at the top and bottom of the exterior of the cylinder assist materially in inducing a current of air to circulate round the cylinder, and so keep the latter cool.

Referring now to the sectional view, Fig. 2, it will be seen that the piston is of special construction. The piston rod *D* is pivoted to the piston *P*. The latter is provided with a special cap or cover of nickel held in place by the piece *C* and the large bolt shown. The advantage claimed for the use of this cap is that it forms a hermetic joint, preventing any escape of the gases at the side of the piston, the force of the explosion acting on the concave end

FIG. 2.—GENERAL ELEVATION OF "COSMOS" MOTOR.

of the cover, and forcing its sides against the walls of the cylinder. The piston-rod *D* is connected at *M* to the disc *L* on the motor-shaft *K*. The admission valve is worked automatically, while the spindle of the exhaust valve *A* is actuated by a cam mounted on a short shaft driven by spur-wheels *I J* off the motor-shaft, the two spur wheels being contained within the casing *H*. The latter is provided with a removable cover *N*, in order to render the working parts of the motor readily accessible. The ignition is effected by means of an electric sparking arrangement, which may be advanced or retarded as desired. The "Cosmos" motor, which normally runs at a speed of 1,200 revolutions per minute, is being made in two sizes— $1\frac{3}{4}$  and  $2\frac{1}{2}$  actual h.p. The makers claim that their motor is the only one that can seriously compete with the well-known De Dion-Bouton motor, and that for its weight and the space it occupies it develops a greater power than any other engine of the kind. The  $1\frac{3}{4}$ -h.p. motor is stated to weigh, without flywheel, only 55 lb., and the  $2\frac{1}{2}$  h.p. only 61½ lb., the dimensions being respectively 15 in. by 5½ in. by 10 in., and 16½ in. by 6 in. by 11 in. Another point claimed for the motor is that all the parts are made on the interchangeable system, and each being plainly marked with a letter or number, it is a simple matter to obtain a duplicate part in case of accident, etc.

Another firm catering to this demand are Messrs. Tauzin and Co., of 11 Rue Bellanger, Levallois-Perret, Paris, who have lately introduced a small motor, which they have named the "Papillon," and which is illustrated herewith in Figs. 3, 4, and 5.

The admission and exhaust valves are mounted, as will be seen from Fig. 4, on opposite sides of the cylinder top. Electrical ignition is adopted, the sparking arrangement being controlled by a cam on the crank shaft outside the cover. It consists of small contact rods held apart by springs *Tt*, Fig. 5, the spark being formed when, the cam *a* having pressed the rod *T* on to the opposite rod *t*, the pressure is released and the two rods brought back to their normal

positions by means of their springs. The cylinder is kept cool by means of a series of radial discs of copper fitted round it; it is mounted on to a bronze oil-containing cover, in which all the working parts run. The single-cylinder motor weighs

FIG. 3.—GENERAL VIEW OF "PAPILLON" MOTOR.

about 55 lb. and measures  $15\frac{3}{4}$  in. by  $8\frac{3}{4}$  in., while it is capable of developing  $1\frac{1}{2}$  h.p. Messrs. Tauzin are also making a two-cylinder motor of the same type to work up to  $3\frac{1}{2}$  h.p. A constant-level carburettor is employed in connection with the motor. Messrs. Tauzin, in addition to supplying their motor to cycle builders, are also constructing motor-tricycles

FIG. 4.—SECTION OF "PAPILLON" MOTOR.

the cooling of the latter. These discs, instead of being cast with the cylinder, are made of corrugated copper, and it is claimed for them that they will disperse six times as much heat as an equal surface of cast iron. The motor is arranged for either electric or tube ignition; the exhaust valve is

FIG. 7.—GENERAL VIEW OF "ASTER" TWIN-CYLINDER MOTOR.

actuated in the usual way by a cam on a small shaft driven by spur wheels off the crank shaft. The motor occupies a very small space, and, while weighing only 66 lb., is claimed to develop 2 h.p. The "Aster" Co. are also making a two-cylinder motor (Fig. 7) of the same type fitted with tube ignition; it develops 4 h.p., and is stated to weigh only

FIG. 6.—GENERAL VIEW OF "ASTER" SINGLE-CYLINDER MOTOR.

themselves. The machine, which weighs complete about 167 lb., is claimed to be capable of attaining a speed of over 25 miles per hour on level roads, carrying one person, and of ascending gradients of from 10 to 12 per cent.

The "Aster" is the name of another new motor which has recently been brought out by Les Ateliers des Constructions Mécaniques "L'Aster," of 33 Cours Benoist, Saint-Denis (Seine), France, and a general view of which is shown in Fig. 6. The chief feature of the motor is to be found in the *ailettes* or radial discs fitted round the cylinder to effect

FIGS. 8 & 9.—SECTIONAL ELEVATION OF "SPHINX" MOTOR AND DIAGRAM OF EXHAUST-VALVE CONTROL.

100 lb., being, the makers claim, particularly suitable for light motor-voitures.

The "Sphinx" is the name of still another motor for motor-tricycles which is manufactured by Messrs. Damas and Clément, of 10 Rue Barbès, Neuilly-Levallois (Seine),

France, and of which detail illustrations are given in Figs. 8 and 9. The motor has a cylinder 70 mm. diameter by 70 mm. stroke; at a speed of 1,800 revolutions per minute it will indicate 2 h.p.; the normal speed is, however, 1,200 revolutions, at which the motor develops  $1\frac{1}{4}$  h.p. Referring to the sectional view (Fig. 8), it will be seen that the motor shaft is in two parts  $B B'$ , each carrying on their inner ends within the phosphor-bronze oil-containing case  $Q$ , discs  $F F'$ , which take the place of the usual crank, the oscillating piston-rod  $T$  being connected to a short shaft  $M$  carried by the two discs  $F F'$ . On the outer end of the shaft  $B$  is carried a spur wheel which gears with a wheel on a small side shaft  $C$  (Fig. 9). On the end of the latter is a cam  $E$ ; this does not lift the rod of the exhaust valve directly as is usual. Pivoted to the side of the oil-containing cover is a lever arm  $H$  carrying at its end a small roller  $r$  which is continually bearing on the cam; the rod of the exhaust valve is also continually in contact with the arm  $H$ ; so that as the cam  $E$  lifts the roller  $r$  the movement is transmitted to the exhaust valve rod  $T$  (Fig. 9) at every second revolution of the motor. The two valves are placed one above the other, the exhaust valve at  $S$  and the admission valve at  $S'$  (Fig. 8). Introduced in the admission tube  $K'$  near the valve are several wire-gauze diaphragms, which prevent, as the ignition of the explosive mixture takes place, any return of flame towards the carburettor. The ignition is effected electrically, a spark due to the sudden breaking of the circuit being employed. The motor, which is provided with radial discs not only to the cylinder walls but also to the outsides of the two valves for cooling purposes, is stated to weigh only about 60 lb. Messrs. Damas & Co. are also making a two-cylinder motor of the same type for light voitures. The two cylinders are set in the same plane, but at an angle to each other, the piston rods of the two cylinders being connected to the same crank.

FIG. 10.—GENERAL VIEW OF BENZ VERTICAL MOTOR.

In addition to their well-known horizontal motor, Messrs. Benz & Co., of the Rheinische Gasmotorenfabrik, Mannheim, have lately taken up the construction of light vertical motors suitable for use on motor-tricycles. The motor (Fig. 10), which does not offer any material point of difference from those of other makers, is fitted with radial discs to the cylinder; the ignition is effected electrically, while the exhaust valve is actuated by means of a cam driven by spur wheels off the motor shaft. The crank shaft runs in an oil-containing case. At a speed of 1,000 revolutions per minute, the motor is stated to develop  $1\frac{1}{4}$  h.p., while the weight, including the carburettor, the induction coil, and the accumulators, is 96½ lb.

M. W. H. Dorey, of 14 Rue Torricelli, Paris, has lately introduced a small motor (Fig. 11) which it is claimed is capable of working up to 2 h.p. It has a cylinder 80 mm. diameter by

FIG. 11.—GENERAL VIEW OF DOREY MOTOR.

130 mm. stroke; the ignition is electrical, while the cooling of the cylinder is effected by means of radial discs. The special feature claimed for the Dorey motor is that its maximum speed is much less than usual, being only 700 revolutions per minute.

(To be continued.)

## THE ELECTRIC MOTOR-VEHICLE.\*

By C. E. WOODS.

(Concluded from p. 80.)

To tabulate these different equipments will be the most concise way of putting them, and I will call my first equipment No. 1:—

Passenger capacity, 2; complete weight of vehicle, 800 pounds; weight of batteries, 440 pounds; average miles run on one battery charge, 20; speed, miles per hour, first  $3\frac{1}{2}$ , second 7, and third 14; number of motors used on vehicle, 1; horse power of same,  $2\frac{1}{4}$ ; number of battery cells, 36; ampères per hour for three hours, 12; time in hours required to charge batteries, 3.

No. 1 equipment, designed for a top carriage or a heavy buggy: Complete weight of vehicle, 1,150 pounds; weight of batteries, 600 pounds; average miles run on one charge, 25; speed, miles per hour, first  $3\frac{1}{2}$ , second 7, third 14; number of motors used on vehicle, 2; horse power of same, 3; number of battery cells, 40; ampères per hour for three hours, 18; time in hours required to charge batteries, 3.

No. 2 equipment, which is designed for four passengers in an open vehicle such as a trap or brake: Complete weight of vehicle, 1,800 pounds; weight of battery, 800 pounds; average miles run on one battery charge, 30; speed, miles per hour, first  $3\frac{1}{2}$ , second 7, third 14; number of motors used on vehicle, 2; horse power of same, 5; number of battery cells, 40; ampères per hour for three hours, 30; time in hours required to charge batteries, 3.

No. 3 equipment, which is designed for both commercial delivery wagons and for my heavy cabs (of which I have built quite a number), and is also applied to heavy carriages with tops, has a passenger capacity for from 4 to 8 people: Complete weight of vehicle, 2,400 pounds; weight of batteries, 1,000 pounds; average miles run on one battery charge, 25; speed, miles per hour, first 3, second 6, and third 12; number of motors used on vehicle, 2; horse power of same,  $6\frac{1}{2}$ ; number of battery cells, 40; time in hours required to charge batteries, 3.

\* Abstract of a paper read before the Chicago Elec. Assn.

The original calculation for one of the large cabs reads as follows: Maximum speed of vehicle, miles per hour, 12; total load to be carried, including four persons, 3,200 pounds; maximum horse power required in motors,  $5\frac{1}{2}$ ; average horse power required in motors, 4; voltage of motors, 72; volts lost in transmission in motor, 8; maximum voltage required, 80; number of cells required at two volts each, 40; maximum ampères required, 52; maximum ampères per motor, 26; average ampères per motor, 22; mileage capacity desired at maximum speed, 30; hours discharge required,  $2\frac{1}{2}$ ; ampère hours' capacity required in battery,  $2\frac{1}{2}$  hours discharge, 110; greatest maximum effort required in motors for overcoming inertia and grade climbing, 9.

In accordance with these calculations from prior experience in smaller vehicles, I designed two motors of a nominal  $3\frac{1}{2}$  h.p. each, either one of which was capable of running the vehicle at a slight overload under normal conditions of level roadway. The tests of the cabs showed on a macadam and asphalt road a very little difference, and called, at the speed of 12 miles per hour, for 42 ampères with a potential of 72 volts at the motor terminals, which amounts to practically 4 h.p. In overcoming inertia the ampères would rise with a slight drop of voltage to 65, gradually diminishing until an acceleration of 12 miles per hour was reached, which acceleration consumed a period of about one half-minute.

There has been a great deal of controversy concerning the excessive weight of motor-vehicles, and also considerable controversy by some of our theorists about what is considered dead weight and pay weight, and I want to say here that this limitation has not, in my experience, as yet been reached. We are perforce obliged to have weight for traction purposes, and many tests made by me on slippery roads, bad places, etc., have proved that with power applied to but two driving wheels we could not reduce our weight more than about 15 per cent. to 18 per cent. of what I have already obtained without being too light for good traction under all conditions of road.

I have also found a very wide difference in amount of power consumed in the use of rubber tires. I recently tried a new tire on the above-named cab which consumed about 18 per cent. more power than the ones I am regularly using. I also, by very careful tests, have discovered that the hard rubber tire is far preferable to the pneumatic tire for use on motor-vehicles—and this without any reference to its first cost, durability, or freedom from puncture. The facts of the case are that the pneumatic tire absorbs more energy by about 20 per cent. when inflated, and by a very considerable increase over this, as it may become deflated to different points of pressure.

The point of control has been a matter of considerable discussion by both those directly and indirectly interested in the development of the motor-vehicle. I have tried series paralleling the fields and I have also used series paralleling the batteries, after which I have adopted exclusively the series paralleling of the batteries as my method of installation. The one thing to be observed is to have very large contacts and connections and to take the same pains in the distribution of the batteries when in parallel as one does in the distribution of current in the armature. In other words, a uniform resistance of the circuits of the different batteries will produce perfectly satisfactory results in their operation, which I do not find to be the case in series paralleling the fields. The latter can be done to such an extent that but a small rise of current would be made in overcoming inertia, but the excessive amount of field winding will over-saturate the fields unless they are unnecessarily large, and tends to a very considerable loss of voltage in dead resistance; and while we economize in current, we do not economize in energy, as in the case of series paralleling the batteries.

Three speeds I have found to be sufficient for all practical purposes, even on our congested streets, and now have my motors running in parallel entirely independent from one another in their propelling function. Fourteen miles per hour for the larger vehicles I have found to be about the

practical limit, as the amount of momentum stored up in the given weights of the vehicles cannot be brought under control by brake application quick enough to be safe in city streets at greater speeds. In other words, we cannot brake on the motor-vehicle any more than we can on the motor-vehicles on rails, beyond the locking of the wheels. In the light road buggy which I have, I have geared it up to twenty miles an hour, and find that with 800 pounds I can handle it with a reasonable degree of safety on boulevards and parks, but I do not recommend these speeds to go any higher as a general proposition; although as a racing proposition I believe that the motor-vehicle will be brought down to  $1\frac{1}{2}$  minutes for a mile, or perhaps even less time.

## THE JEANTAUD IRREVERSIBLE WHEEL-STEERING DEVICE.

IN a recent issue we mentioned that M. Jeantaud, of 51 Rue de Ponthieu, Paris, the well-known French builder of electrical motor-vehicles, had lately devised an improved irreversible hand wheel-steering device for motor-cars, or a steering gear so arranged that while the front wheels respond to the action of the steering hand-wheel, the former

FIG. 1.—PART SECTIONAL ELEVATION.

FIG. 2.—SECTIONAL PLAN.

cannot inversely, when the meeting of an obstruction has a tendency to throw them out of their proper course, transmit any movement to the hand-wheel, and the tendency of the

road-wheels to be swerved from their designed course is immediately checked. We are now able to give some further particulars of the device, as also two illustrations taken from the patent specification. Fig. 1 shows a section through the steering hand-wheel and gear on the top of the steering standard, and Fig. 2, a plan on line *A B C D* thereof. The steering wheel 2 is connected to a special piece 3, both being loosely mounted on the vertical shaft 1. The piece 3 is provided with two tongues, 4, 4', the use of which is described below. Keyed on the shaft 1 is a further special piece, 5, 5', to which again are rigidly connected by the adjustable bolts 8, 8', two pieces, 7, 7'. The pieces 5, 5' are provided with tongues 6, 6', similar to those on the ends of 3, while on 7, 7' inclined planes 12, 12' and 12'', 12'' are formed. A stationary drum, 10, attached to the steering pillar, surrounds all these various parts. Close to the inside of this drum are arranged two leather-faced spring bands, 11, 11'. The latter are of a special form, each being provided with recessed parts to correspond to the tongues, 4, 4' and 6, 6', and in addition inclined surfaces corresponding to those, 12, 12' and 12'', on the pieces, 7, 7'. In steering when the hand-wheel 2 is moved in one or other direction (say such as that shown by the arrow 13) the piece 3 also turns, and one of the tongues, say for example 4, tends to draw out of its recess in the spring band 11, and by reason of an inclined surface on the tongue allows the tension on the spring 11 to be withdrawn, so breaking the contact of the latter with the wall of the drum 10. The tongue 4' is simultaneously brought into contact with its corresponding recessed part of the spring band 11', and thus the recess in this band is brought into contact with its tongue 6', and thus moves forward the pieces 5, 5', and 7, 7' to the desired extent, and consequently the shaft rotated, 5, 5' being keyed on it, in the same direction as the hand-wheel. When the hand-wheel is turned in the opposite direction the connection with the shaft 1 is made in a similar way but by means of the spring band 11 and the tongues 4 and 6, so that the shaft 1 can be freely rotated to the requisite extent by means of the hand-wheel, in either one or the other directions, as desired.

Suppose, now, that an obstruction on the road, or other cause, tends to throw the front road-wheels temporarily in a direction contrary to their designed course, there would be a tendency for the shaft 1 to move in the same direction; the piece 5 fixed rigidly on the shaft would also be displaced. Supposing this displacement to be in the direction of the arrow, the tongue 6' on the piece 5' would move forward with the result that the inclined surface 12' 12'' would overtake the corresponding incline on the spring band 11', and wedge it tightly against the walls of the drum 10, thus not only preventing any action on the tongue 4', the piece 3, or the hand-wheel 2, but also preventing any serious deviation of the front wheels from their proper course. Similarly, should the obstruction, etc., cause the front wheels and the steering standard to turn in the opposite direction, the tongue 6 would recede from its recess in the spring 11, and the latter, owing to the action of the inclined surface 12, 12', would be forced into contact with the drum, so preventing the recess in the spring acting on the tongue 4.

M. Jeantaud claims for his new steering device that however rough or uneven the roads traversed none of the jolting is transmitted to the hands of the driver; that the front wheels respond to the action of the hand-wheel, but cannot, inversely, act on the hand-wheel; and, finally, that it offers the same advantages as worm-wheel steering without the drawbacks of the latter.

ACCORDING to the statistics of the French motor-car industry, the payment for wages in that particular branch of French industry has been 2,200,000 dols. for the last year.

A NUMBER of Rochester, U.S.A., capitalists have formed a company to manufacture motor-wagons and run a line of automobiles between that city and Lake Ontario, six miles distant.

## THE LONDON STEAM OMNIBUS IN 1833.

THE amusement caused by the inauguration of the London Steam Carriage Company's service in 1833 found many forms, and even penetrated into the columns of the leading technical journal of the period. We refer, of course, to the *Mechanics' Magazine*, now incorporated with *Industries and Iron*, which on August 31st, 1833, published the report of an imaginary conversation that had taken place in its office in Peterborough Court, E.C. It contains many skits on the excuses made by contemporary inventors for the failure of their attempts to develop road locomotion by steam, and called forth a letter from the solicitor of Mr. David Redmund, of 68 Charles Street, City Road, who felt he had been badly treated, and that the publication of what the editor called the "Peterborough Court Conversazione" was "calculated to do him serious injury with the public in the way of his trade." Damages were claimed, but apparently the claim was never taken into court, the *Mechanics' Magazine* remarking that "as 'no steam carriage has yet been started' by the Mr. Redmund who is 'advertising to supply steam carriages to the public,' it could not have been Mr. Redmund who built the Eclipse, which was supplied with foul water, which caused the boilers to prime, which caused the yokels to laugh, etc."

It will be observed that much of the sarcastic skit which is herewith reproduced is applicable to the imperfectly completed and immature vehicles that have been put forward in recent time to furnish Londoners with steam omnibuses.—  
ED. M.-C. J.

### PETERBOROUGH COURT CONVERSAZIONE.

AUGUST 31ST, 1833.

*The Editor, Professor Crackwell, Counsellor Tout-Voix, Dr. Tangent, and Solomon Secundus seated round the table. St. Bride's Church clock heard striking.*

EDITOR: How's this? Nine o'clock, and so few arrived. How strange! Last night we were crowded to suffocation, and now—

*(Noise and bustle in the court, and in rush a number of persons with Sir Dionysius Dawplucker, blowing and puffing, at their head.)*

EDITOR: How now, Sir Di., and good friends all? You seem agitated.

SIR DI.: Agitated, sir? Say, rather, shaken to pieces.

SOL. SEC.: With laughter, Sir Di.?

SIR DI.: No, faith. 'Twas no laughing matter, believe me. Speed will tell you all about it.

SPEED: Why, you must know, gentlemen, I was politely offered by my friend Toplis, who is Director-in-Chief of the Paddington Steam Omnibus Company, the use for this afternoon of a new carriage which they have constructed called the "Eclipse."

CRACKWELL: Is that another of Hancock's?

SPEED: No; Hancock and the Company have quarrelled, and this is a new carriage constructed by an engineer of their own.

SOL. SEC.: The same person, I believe, who advertises to supply other people with steam carriages that will answer to admiration—before he has been able to construct a good one for himself.

EDITOR: I believe the same; but allow Mr. Speed, if you please, to proceed.

SPEED: Well, I invited Sir Di., Barbette, and the rest of them to have a ride in it. We started, nineteen in all, at four o'clock, from the Company's premises, City Road, meaning to steam to Shepherd's Bush, go round by Kensington, and, returning through Piccadilly and the Strand, to set down at Peterborough Court by eight o'clock, your usual hour of assembling.

SOL. SEC.: Which is about ten miles in all, I calculate; and this in four hours! Prodigious effort!

SPEED: We did not, Sir Sardonicus, go for velocity at all. We wished to get a thorough insight into the manner of the machine's working, and the more leisurely we travelled, of course, the better.

EDITOR: Well, and how worked it?

SPEED: Oh, upon the whole, admirably. That is to say, so far as the principle and construction of the machine were concerned. Nothing, indeed, could have been better; but, unfortunately, we had a number of untoward circumstances to contend with, which impeded our progress a good deal, and caused one or two rather unpleasant accidents.

STRANGER: Yes, very untoward circumstances indeed.

EDITOR: Your name, if you please, sir?

STRANGER: Dick Rattler, at your service: first cousin to Mr. Speed. The circumstances, as I was saying, were very untoward indeed. First, as we were going down Pentonville Hill a little screw got loose, and that, you know, is a thing which might happen to the best of machines—

SOL. SEC.: To be sure, and to the best of people. Your loose screw is a notorious mischief-maker.

RATTLER: And so it took us a full half-hour to get that screw tight again. But when we did start anew, cranks and crinkums!—how we did go it; I think we must have made the distance between King's Cross and the "Yorkshire Stingo" in less than twenty minutes. By this time, as bad luck would have it, the boilers had begun to prime.

TOUT-VOIX: What's that?

RATTLER: Why, it's a phrase engineers have to signify the state of boilers when the water gets into the spaces which should be occupied by steam, or what I should call in a *prime* bad condition. But that, the engineer assured me, was all owing to our having been supplied with confoundedly dirty water, and that, you know, is a thing which might happen to anybody.

SOL. SEC.: Happens every day.

RATTLER: Well, so much water was in consequence spurted out on the road that, as we left the "Yorkshire Stingo," the cads and other yokels laughed and shouted after us, "See at the new water-cart!" Our steersman, who takes great pride in his engine, got angry at this, and, turning round his head to say something smart to the rascals, at that instant another steam carriage came, at full speed, right across our path from a side street.

CRACKWELL: Good heavens! and struck right against yours?

RATTLER: No, this once we were in luck; for, in the very nick of time, when a concussion seemed inevitable that would have sent us all to kingdom come, a large over-driven ox rushed in between the two vehicles, and received the shock that seemed destined for us.

CRACKWELL: How providential! And the poor ox?

RATTLER: Was smashed dead—all of a heap—as if struck by lightning.

EDITOR: And whose carriage was this that you encountered?

RATTLER: Squire and Maceroni's, which, I understand, is constantly practising in and about Paddington, and is famous for accidents of this sort.

CRACKWELL: Yes; it knocked a house down once.

EDITOR: No, it only carried away one wing of it, and that through the inexpertness of the steersman; which, of course, as Mr. Rattler would say, argues nothing against the machine itself.

SPEED: Certainly not, no more than the untoward occurrences which Rattler has so accurately related are to be considered as disparaging to the machine on which we were mounted.

SECOND STRANGER: 'Tis, to my mind, a clear case. From the water being foul—

EDITOR: Another friend of yours, Mr. Speed, I presume?

SPEED: Beg pardon for my neglect. Mr. Editor, my friend Mr. Dick Dubious—Dick, my friend the Editor.

EDITOR: What?

Dick Dubious the metaphysician,  
Who loved philosophy and a good dinner.

—(Don Juan.)

DUBIOUS: The same; and one who, though personally unknown to you, sir, has been a constant admirer and frequent correspondent of your inestimable journal.

SOL. SEC.: Which may account, perhaps, for the many *dubious* things that have appeared in it!

DUBIOUS: I was about to observe, gentlemen, that it was a clear case, inasmuch as it was the water being foul that caused the boilers to prime, and it was the priming of the boilers that caused the cascading on the road, and it was the cascading on the road that caused the bystanders to shout, and it was the shouting of the bystanders that caused our steersman to turn his head, and it was that turn of the head which placed us all in jeopardy.

SOL. SEC. (*chaunting*): This is the house that Jack built; this is the malt that lay in the house—

EDITOR: Peace, Solomon! Let us hear the rest of the adventure.

RATTLER: Leaving Squire and Maceroni to settle with the drover as they best could for the demolition of the ox, we hurried onwards, and reached Bayswater without any further accident or interruption. Here we stopped to take in water and fuel, and to clear the fire-bars from clinkers which had accumulated so much as almost to put a stop to the draught. Toplis said it was the badness of the coke that caused the clinkers, and, since such was the case, the engine of course could not be to blame; nobody, you know, can help being served with a bad article at times.

SOL. SEC. (*aside*): No, not even with a wretchedly bad engine.

(To be concluded.)

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### Last Saturday's "Benz" Meet.

FOLLOWING out his programme of Saturday runs, Mr. Hewetson last Saturday organized an all-day run to Bedford and Biggleswade, leaving Oxford Street early in the morning. The journey to Bedford was accomplished without incident, the weather, however, being dull and threatening. After lunching at the Swan Hotel, the tourists were besieged by members of the public and several representatives of local newspapers who were desirous of having a trial spin, and foreseeing this Mr. Dan. Albone, the local agent for the Benz cars, had made satisfactory arrangements, with the result that their desires were gratified, and the capacities of the new hill-climbing gear of the Benz cars fully demonstrated. Subsequently the party proceeded to Biggleswade, Mr. D. Albone's Ivel Hotel being the headquarters. After dinner the party was joined by Mr. and Mrs. Edge on a Levassor car and Mr. Jarrott and Mr. Weigel on motor-tricycles. The night was spent at the Ivel Hotel, and on Sunday morning, after an inspection of the Ivel Cycle and Motor-Car Works, the party proceeded on a circular trip through the surrounding pretty village. Ickwell was, of course, visited, and this old-world village, with its quaint houses and its village green and dominating maypole, was duly admired. Old Warden too, evoked considerable admiration, its well kept streets and pretty situation causing considerable enthusiasm. This trip was a thoroughly enjoyable one and a welcome addition to the programme. After returning to Biggleswade the party made the best of their way home, some travelling via St. Albans and others via Cambridge. Some considerable excitement was caused by the passage of so large a number of cars through the villages. It is interesting that Biggleswade should so soon come to the front in the early days of Saturday motor-touring. In the early days of cycle road-racing, Biggleswade was the record breakers' shrine. Being on the main York road, only 45 miles from London, with roads of fine surface and easy gradient, Biggleswade makes an ideal destination for short trips, more especially as motor-carists can be sure of the ready help of Mr. Dan. Albone and his staff in making any of "those little adjustments" which are sometimes necessary with the best of cars.

### Public Motor- Vehicle Services in Liverpool and Cheshire.

As we have mentioned in two previous issues, the projected service of cars for districts on the Cheshire side of the Mersey is well on the way towards fulfilment. A very considerable amount of interest is being taken in the matter locally, and the routes now selected for the first services of eight cars include many in the Wirral peninsula. The cars will be of the *char-a-bancs* type, and will carry nine persons, having motors and mechanism on the Daimler-Levassor principle. Amongst other routes selected are the following: New Brighton Tower and Seacombe Ferry, New Brighton Tower and Leasowe, Hoylake, West Kirby, etc., and others to Birkenhead, Heswall, Neston, Parkgate,

Chester, etc. As soon as these services are actually started the promoters of the syndicate will turn their attention to Liverpool, and provide that city and its suburbs with a quick service of motor-vehicles. In addition, Liverpool is promised at an early date a service of electric cabs. These will most probably be constructed on the Carl Oppermann principle and will include open vehicles or landaus as well as those of the coupé type. So far as the public service on the Cheshire side is concerned, not only have the New Brighton Tower Co. taken an interest in the matter, but there is a strong competition amongst the hydropathic establishments and the hotels that their premises shall be included in the routes selected.

### The Motor-Car Club's Meet at the Crystal Palace.

Mr. F. W. BAILY, the Hon. Secretary of the Motor-Car Club, informs us that the forthcoming meet of the Club and friends at the Crystal Palace on Saturday, May 6th next, promises to be a huge success, the entries already received being quite up to expectation, both in point of number and also from the point of variety of the types of cars. Additional interest will also be given to the meeting by the fact that Mr. S. F. Edge has taken up the challenge of his old cycling antagonist and friend, Mr. C. G. Wridgway, and will ride a match with him on the track. The Crystal Palace Company have offered an additional gold medal for this contest. In addition, it has now been decided between the Motor-Car Club and the Crystal Palace Company that an invitation race, open to all motor-cycles, whether two or three wheeled, shall also take place. Mr. Baily will gladly receive names of those desiring to enter. By this means additional interest will be given to the proceedings. The programme now stands as follows:—At 12 noon: Meet of the Club and friends on Thames Embankment (Westminster end). 1.30 p.m.: Parade of all cars contesting, as well as those visiting the Crystal Palace, on the principal terrace (the same on which the firework set pieces are displayed). 2 p.m. to 5 p.m.: Motor-car control contests. 5.30 p.m.: Invitation open five-mile motor-cycle race. 5.50 p.m.: Match between Messrs. S. F. Edge and C. G. Wridgway. 7 p.m.: Informal dinner of members, friends, and guests of the Motor-Car Club and of the Crystal Palace Company. We are glad to record this instance of the Motor-Car Club's endeavour to promote and encourage the development in the use of automobile road vehicles, and trust that all London automobilists will make a point of being present on their cars, so that the parade may be worthy of the occasion.

### Evolution of Automobilism in the U.S.A.

DISCUSSING the history of automobile development in the *New York Press*, Col. A. A. Pope says: "The earlier attempts to produce motor-vehicles were failures. They were unwieldy and clumsy, and too costly to maintain. The introduction of railroads in the first half of the century practically put an end to their use. Since the early eighties the improvements in gasoline motors have enabled inventors to create more or less

THE FIRST 546 FEET OF THE "MOUNT" AT GUILDFORD.

satisfactory horseless vehicles. The development of these has suffered to a certain extent because of a degree of complication in construction and operation, puzzling to the average purchaser but simple enough to the inventor, maker and expert mechanics generally. That is a result of sacrificing simplicity for the unnecessary requirements of great speed and purely technical considerations. Hence comes the advantage of electricity for the power in horseless vehicles. Of all mechanical devices those involved in the application of electricity are most familiar to the general public. It is by the use of that power that it has been possible for the Americans to produce their modern vehicle, the manipulation of which requires no greater mechanical knowledge than the pressing of an electric button, and no greater watchfulness than in driving a horse. That the American electric carriages are a success is evidenced by the fact that they are sought by purchasers in the well provided markets of Europe in even larger numbers than in the home country." Col. Pope neglects, however, to state the disadvantages of the electric vehicle for any other than town traffic. Its inability to travel with safety more than about thirty miles without recharging its batteries is a serious obstacle to the successful use of the electric vehicle for touring purposes. The time taken up in charging, when charging stations are available, extending as it does over some hours, is also a serious inconvenience, and the electric vehicle will never be popular except for mere town and suburban journeys until at least an entirely new form of accumulator is placed upon the market which is free from the inherent defects of the present types.

#### The South African Express Company and Native Passengers.

WE have before alluded to the success attained in Cape Town by the motor-vehicles running in public and private service and owned by the South African Express Company. The Company has undertaken the carrying of mails, and this quite satisfactorily and successfully; and we understand that the Company's operations are shortly to be extended into the Orange Free State. Mr. Liebmann, the Company's manager at the Cape, has had to contend with several difficulties, not the least of which has occurred by reason of the "native and coloured people difficulty." So soon as public conveyances at cheap fares are placed on different routes they are besieged by natives and coloured people, this preventing white people from using the vehicles. By enactment it is impossible to refuse to carry the coloured people, and hence the difficulty. This trouble was peculiarly acute with motor-vehicles, but Mr. Liebmann has hit upon a very neat solution. By the terms of his licence and the city

regulations Mr. Liebmann cannot refuse to allow such persons to ride in the cars, but he is not tied down to any fixed charge, so he has effectively settled the matter by stating that his charges of threepence to the Graving Dock and sixpence to the mail steamer are for white people only; natives and coloured people will have to pay five shillings and ten shillings. It is hardly necessary to say that by this means the entire exclusion of the objectionable element from the motor-cars is secured, and the *Cape Register* holds that it is a pity that other owners of wheeled conveyances in Cape Town do not follow Mr. Liebmann's example.

#### The Gradient of the "Mount," Guildford.

SOME weeks ago we recorded the trial trip of some Benz cars fitted with the new hill-climbing gear, during which trials the ascent of the "Mount" at Guildford was negotiated. At the time of the trials the Borough Surveyor, Mr. C. G. Mason, A.M.I.C.E., very kindly gave us the gradient of the "Mount" as a whole, stating that the first part of the hill (in Mount Street) had an average gradient varying from 1 in 7 to 1 in 8, and that the average gradient of the whole hill was 1 in 16. The first part of the hill, that in Mount Street, has, of course, the steepest gradient, and, in order that the gradients of this section might be placed on record, Mr. G. A. Franks, surveyor, of Guildford, was induced to take the gradients of this section exactly. The result of his labours is given in the diagram above, which represents the first 546 ft., or say 185 yards, of the hill. It will be seen that for a short distance the gradient is 1 in 6, whilst the average for this part of the hill is 1 in  $7\frac{1}{4}$ . We have heard several persons speak of this first portion of the "Mount" as having a gradient of 1 in 6, or even 1 in 4, and to an untrained eye the gradient does appear to be extremely severe. Our reason for taking the course we have done was to afford some means of demonstrating what a stiff hill a gradient of 1 in  $7\frac{1}{4}$  really is, and, on the other hand, how seldom such a heavy gradient is met with in ordinary practice. Those who are considering the advisability of ordering a car frequently lay down a condition that it shall be able to climb a gradient of 1 in 4 with a full load. Of course this is not impossible, but in the majority of cases this condition is entirely unnecessary, sacrificing, in addition, the first speed to such an extent that even on the level it becomes a mere crawl—too slow, in fact, to be of any practical use when it is required to travel at first speed through traffic. We, of course, support the provision of a low first speed, but deprecate its being made of little use simply that it may be able to carry out a duty which will probably never be demanded of it.

# A Long Tour on an Electric Vehicle.

THE daily newspapers are full of reports of the undertaking of Mr. Jackson, of Aberdeen, who left Aberdeen on the 18th inst. in an electrical carriage, with a view of carrying out a journey to London, and from thence back to the Granite City. There is nothing wonderful in this tour, however; Mr. Jackson is quite able to secure a supply of current for recharging his accumulators at the different large towns through which he passes, and many an automobilist has done equally as long journeys without all this blowing of trumpets. If Mr. Jackson would undertake to drive from Aberdeen to London and back again to Aberdeen without recharging his accumulators, then we should be the first to applaud his undertaking; even if he undertook to drive his carriage 100 miles without recharging we would give him applause; but these continual "press puffs" savour too much of advertisement to be to our taste.

# Restrictions of Language.

SINCE the dawn of the age of motor-cars every Englishman connected with the industry has found reason to grumble at the poverty of the English language in possessing words which shall adequately and truthfully express some phase or subject connected with the automobile industry. Even in the naming of the vehicle carrying its own propelling mechanism there has been considerable difficulty—"self-propelled vehicle," "motor-car," "auto-car," and many others having been brought forward at various times, each having faults, and none positively conveying the meaning actually intended. Ultimately, however, "motor-car" has been perhaps the more generally adopted by the public, varied occasionally by the English adaptation of the French "automobile." Two at least of our contemporaries are not satisfied with any generally accepted term, however, and have adopted the horribly hideous terms of "moto-car" and "moto-vehicle" availing themselves of a permissive law in philology which permits the dropping of the final consonant of the first portion of a compound word when the final portion also commences with a consonant. We notice, with some amusement, however, that these journals only avail themselves of this law when speaking of "moto-vehicles" or "moto-cars"; in other compound words they retain the final consonant of the first portion with perfect regularity and unanimity. In glancing through the pages of one of these contemporaries we find that they still use "series-wound," not "serie-wound"; "crank-shaft," not "cran-shaft"; "piston-rod," not "pisto-rod"; "club-house," not "clu-house"; "self-propelled," not "sel-propelled"; "cotton-spinning," not "cotto-spinning"; "cog-wheels," not "co-wheels"; "chain-wheel," not "chai-wheel"; "light-fitting," not "ligh-fitting"; "four-seated," not "fou-seated"; "crank-pin," not "cran-pin"; "second-hand," not "secon-hand"; "old-fashioned," not "ol-fashioned"; "water-tube," not "wate-tube"; "public-house," not "publi-house"; "pair-horse," not "pai-horse." In fact, we are assured by our office-boy that in one issue of this contemporary there are several hundred compound words in which the first portion ends, and the last portion commences with a consonant, and that in no single instance is the final consonant of the first portion deleted except in moto-car, -carriage, -vehicle, or -cab; whilst in one case "motor-car" is retained in its entirety; and that in addition this journal also uses "motor-car" in its business announcements. There is no doubt, however, that there is a difficulty in finding suitable terms; for instance, we speak of a man possessing "a stable of horses," "a team of horses," "a fleet of boats," "a pack of dogs," or "a flock of sheep"; but when we desire to shortly describe the possession of several motor-cars we are met with some difficulty. A "fleet" of cars has been suggested, and for want of a better we have adopted this expression. In speaking of the "stabling of a horse" we

are of course quite in order, but in endeavouring to find an expression denoting the "putting away" of a motor-car we are met by difficulties. One correspondent uses the expression, "we 'depôté' our vehicle," but this is neither commendable nor pretty, and we may add that our correspondent is an American. Nor have we any definite word for the place where a motor-car is stored. The French use the word "*garage*," which is perhaps best translated as "dock," but "in dock" would perhaps imply to English ears that the car was under repairs. We notice that several correspondents have expressed themselves as having "stabled their cars," but this expression is hardly correct. As the automobile movement extends, however, fairly satisfactory expressions which are at present without meaning will doubtless be dragged into service, but, in the meantime, we must try to jog along without them. The want of a verb denoting the act of driving or riding in a motor-car is also severely felt; "to mote" has, of course, been suggested, but it has, at present at least, much too horrible a sound to be accepted as a solution for immediate adoption.

# The Automobile Club's Tours.

THE Automobile Club run to Frensham will start from the Club at 9 a.m. to-morrow, Saturday, 29th inst., and there will be a rendezvous at the White Horse Hotel at Guildford at 12 o'clock. The route out of London will be *via* Hammersmith Bridge, Sheen Gate, and Kingston Gate of Richmond Park and the Ripley Road. On leaving Guildford the motor-vehicles will proceed to the residence of Colonel Davis, A.D.C., at Whitmead, Tilford, Colonel Davis having invited the members of the Club to visit his country seat. Luncheon will be taken at the Frensham Pond Hotel, and tea at St. Mary's, Godalming, by the kind invitation of Mr. Buttemer. There is to be a further run on Saturday, May 13th, the start from the Club to be made at 2 o'clock. The night will be spent at the Burford Bridge Hotel, Boxhill, and the return to town accomplished on the following day. Those members who are unprovided with vehicles will be pleased to hear that the Liquid Fuel Engineering Co. have kindly placed seats in their steam wagonette at the disposal of the Club for the Whitsuntide tour. In reference to this tour it may be mentioned that Lord Leigh has kindly given permission for the motor-vehicles taking part in the Whitsuntide excursion to run through Stoneleigh Park.

# Eastbourne and its Motor-Car Service.

WE recently alluded to the difficulties which had been experienced in obtaining a licence to run public motor-vehicle services in Eastbourne, and to the fact that the Town Council and Clerk were strongly opposed to the scheme, holding the opinion that a speed of six miles per hour was quite sufficient within the confines of the town. The syndicate seeking to run this service were therefore very much discouraged when their application for a licence was positively refused. Of course, communications at once passed between the syndicate and the firm entrusted with the order for building vehicles for the service, pointing out that if the licence could not be secured the vehicles on order would hardly be required. It is to the credit of those who were making the vehicles that they were not at all discouraged, and advised the syndicate to renew their application for a licence, promising to aid them in every way to obtain it. In the result the application was renewed, the Motor Manufacturing Company sending down a vehicle in the charge of their secretary, Mr. Alfred Burgess, in order that the Chief Constable, the Watch Committee, and the Town Clerk might have ocular demonstration of the ease with which the vehicle could be controlled, and personal experience of the comfort and ease of progression by a motor-vehicle. The day unfortunately turned out exceedingly wet, but Mr. Burgess stuck to his post, and, thus encouraged, the Watch Committee went for an experi-

mental tour, being quickly drenched to the skin. The control of the vehicle was, of course, thoroughly demonstrated, and under the most trying conditions possible, with the result that the Committee granted the licence, but, unfortunately, included a clause that the rate of speed through the town should not exceed five miles per hour! The horse-drawn *chars-a-bancs* ply for hire under no such restriction, and it is rather hard that one means of progression should be taxed in this way and another allowed to take its own sweet will. However, the syndicate are satisfied even with this restrictive licence, and have decided to run their service as arranged. It has been whispered that when Mr. Burgess had conveyed the Watch Committee some eighteen miles outside Eastbourne, it raining very heavily at the time, he absolutely "held up" the Watch Committee, threatening to make them walk home through the drenching rain unless they promised there and then to grant the licence! Of course, we do not for one moment believe in this rumour.

#### A Prize for a Safety Device.

IN connection with the Automobile Club Show, Major H. A. Barclay, J.P., D.L., has offered a prize of twenty guineas for the best device by which the burners of motor-vehicles having tube-ignition shall be automatically extinguished in the event of a car, from accidental cause, assuming such an angle to the road, either in a side-ways or endwise direction, that there would be a danger of the car becoming upset. Inventors who intend to compete for this prize should send in their names—not later than May 13th—to the Secretary of the Automobile Club Show, 4 Whitehall Court, London, S.W. The decision as to the award of the prize will be left in the hands of the show judges, viz.: Mr. W. Worby Beaumont, M.I.C.E.; Professor C. Vernon Boys, F.R.S.; Mr. Dugald Clerk; Mr. Bryan Donkin, M.I.C.E.; Major H. L. Holden, R.A., F.R.S.; Professor Hele-Shaw, LL.D., M.I.C.E.; Mr. W. H. Preece, C.B.; Mr. Boverton Redwood, F.R.S.E.; Sir David Salomons, Bart., J.P., and Mr. James Swinburne. The judges reserve the right of not awarding the prize, if in their opinion no device submitted is adequate for the purpose stated.

#### Around Cottonopolis on a Pennington Car.

IN the personality of our Manchester correspondent, we one afternoon last week found time to enjoy a long-promised ride on one of the new Pennington motor-cars. The new Pennington double-cylinder "Victoria" was selected for the occasion. Very soon we started, and experienced pleasurable astonishment at the facility and accuracy with which the car was guided through the crowded streets. The undeviating ease with which we ran up the hills certainly was a surprise, and although it may seem to some astonishing to say so, we mounted the gradients just as easily, and almost as quickly, as we travelled on the level. We also appreciated the feeling of safety owing to the little height of the vehicle from the ground, the wheels not being of an unnecessarily large diameter. The tangent-spoked wheels with their pneumatic tires, coupled with the fact that the carriage is isolated as far as possible from the frame carrying the motor, ensures that but little vibration is felt by the riders. The Pennington cars, as is well-known, are steered by the rear wheels, the drivers being in front. The ease with which the car was made to turn almost in its own width was remarkable. In what really seemed like the proverbial "less than no time" we travelled back, now through a country lane, then up a hill and down into a village, where the sleepy inhabitants, with staring eyes and opened mouth, seemed to wonder what kind of animal it was rushing by. On reaching "home" we took the liberty of feeling the tank containing the cooling water, and found it to be merely luke-warm; the exhaust box, too, was so cool that it was possible to touch it. We learn that four-fifths of the orders for the coming season already booked

by Messrs. Pennington & Baines are to be provided with two-cylinder motors, the vehicles being geared up to twenty-five miles per hour on the level, and to take any customary gradients at eight or ten miles with a full load. Our experiences on this run, occupying about one hour, amply demonstrates that the Pennington car *will* go, and go well.

#### More Trials of the Pennington Car.

FOR some considerable period the Pennington motor-car has formed a subject of correspondence in the columns of the journals devoted to motor-cars, and the appearance of the Pennington car has been long and anxiously looked forward to. In London for the past fortnight two cars have been on view and in evidence at Messrs. Mulliner's carriage factory, Brook Street, Bond Street, and these cars have been tried by many prominent people connected with the industry. Our London representative, amongst others, had a short spin; while in Manchester our representative had a twenty-five mile run, which was most satisfactory and a "non-stop" from start to finish. This is recorded in another portion of the present issue. Another representative of ours while in the North has also been driven on one of these cars provided with a single-cylinder motor, and was very much impressed with the facility and ease with which the car ran. Its turning and steering capacity is something wonderful, and it certainly causes a shiver to pass through the frame of the passenger who may be sitting beside Mr. Pennington when he suddenly turns completely round in order to show this off effectively when going at full speed. The present writer was so pleased with the running of the car and its great speed that he arranged for a day's run to Chester and back, a distance from Manchester, we believe, of something like forty miles, but unfortunately was unable to keep this appointment. On the following day Mr. Pennington was kind enough to renew his offer, but as it was then raining hard we did not accept. Very shortly we are promised the use of one of the cars, and will then hope to have some extended runs; and in the meantime we have no hesitation in expressing the opinion that the new Pennington motor-car is a distinct acquisition to the vehicles obtainable in this country, and that from our limited experience there is but little (if any) fault to be found with them. We understand that the London agency for these cars will shortly be opened in Berners Street, Regent Street, under the charge of Mr. Burns, and that within a few days examples of various cars will be on show there, as well as "testing vehicles" for the convenience of intending purchasers.

#### Motor-Car Firms in the North.

PERHAPS it is only natural that in the great engineering centres of the North of England evidences of advance in motor-car building should be apparent, and that a number of both new and old firms should be at work experimenting. In Halifax the Anglo-American Motor Co. have very fine works, and a strong staff of men at work. They have already sold several cars, and have plenty of orders on hand—in fact, so many that the Company already contemplate building larger premises. It was a pleasure to go with Mr. Myers through the Anglo-American Company's works, equipped as they are with splendid tools; and the excellent workmanship of the output was apparent everywhere. Unfortunately we are not permitted to give any details of the Company's motor-vehicle other than those appearing in our issue of the 14th inst., but that it is one of the best on the market we are content to announce. Aluminium is very largely used in the construction of the car, and the frame is of weldless steel tubing. Messrs. Wadsworth, of Westgate, Halifax, are makers of street-cleansing and other sanitary machinery. They have been at work on a steam motor for some considerable period. The first vehicle built by the firm is a steam street-sweeper, which we shall hope to use with effect at the Agricultural Hall

in July next. Messrs. Brown & Buckton, of Hipperholme, near Halifax, make small, light, double-cylinder motors—the “Mytholm.” We were promised an illustration and particulars of details, but up to the time of going to press these have not arrived. In Leeds, of course, there is the well-known firm of Mann & Charlesworth, Dewsbury Road, makers of steam vehicles for carrying any weight up to five tons. This firm is very busy, as are also Messrs. Greenwood & Batley. In this town we saw a photo of a handsome little two-seated steam dog-cart, which we hope to illustrate in about a fortnight's time. A well-known firm of electrical engineers (Messrs. Dickinson & Co.) are considering the advisability of constructing electrical vehicles, and at Preston Messrs. Coulthard are full of orders for their steam vehicles. At Preston the Lancashire Steam Motor Co., Ltd., invited us to attend the trial of a new steam omnibus carrying eighteen passengers. This we were glad to do, and watched it careering up and down the roads at from twelve to fourteen miles, with considerable interest. The trial was eminently satisfactory in every way. We understand this omnibus has been built for Messrs. Stirlings, of Hamilton.

#### The American Electrical Cab.

WHEN Lord Charles Beresford was in New York the American newspapers were filled with remarks upon certain journeys undertaken by him in an electrical cab. He was reported to have commented favourably upon this means of locomotion, and to have expressed his delight at the convenience and comfort of the vehicles. On Wednesday night last, however, he made a speech at the annual dinner of the Institute of Mechanical Engineers, in which he gave quite a different account of his feelings. He said that “no doubt the mechanical engineer would soon be able to supersede the 'bus and the cab and the growler by means of the motor. Half of our traffic was now congested because half of the carriage was composed of a horse. (Laughter.) Get rid of the horse and they would double the room in the streets. (Loud laughter.) When he was in New York he went into a motor-car which had the appearance of a cab but possessed the manners of a kangaroo. (Roars of laughter.) At any rate it got him safely to his destination.” From this it would appear that although Lord Charles is in favour of automobile locomotion, yet he did not altogether approve of the “antics” of the New York electrical “kangaroo.” In connection with these vehicles, the following extracts from the last issue to hand of our American contemporary, the *Wheel*, which devotes more attention to automobile matters, will be of interest:—“An electric cab ran wild on the New York Boulevard last week. After unsuccessfully trying to climb a telegraph pole the mechanical horse deliberately threw out its passengers, dumped its controller off, turned over on its back, and ran its wheels around in sheer mechanical madness at its inability to do more damage. While all of this was going on nothing but horse laughs came from the quadruped power producers of the Boulevard car line.” We were not aware “kangaroos” ever endeavoured to climb poles, but if the New York electrical cab is anything like the creature that the *Wheel* would have us believe, we are not surprised that Lord Charles Beresford did not enjoy its antics.

#### “The Disestablishment of the Horse.”

SPEAKING at the annual dinner of the Institution of Mechanical Engineers on Wednesday, Mr. Goschen also paid a tribute to the mechanical engineer as the invisible contributor to the triumphs of the civil engineer and naval architect. Mechanical engineers, he said, were constantly subduing all the forces of nature—air, fire, electricity and water. They had gone even further and “had almost disestablished horses on our country roads, and they were now about to disestablish

“horses by the motor-car in our London thoroughfares.” Without endorsing the latter part of Mr. Goschen's playful reference to the motor-car, makers will be pleased to see such a recognition of the advance they are making; and some may ask: “Is Mr. Goschen also among the motor-carists?” The advent of the first Cabinet Minister in Palace Yard by means of these vehicles would certainly give an impetus to the favour with which motor-cars are now regarded.

#### MOTOR-TRICYCLE FATALITY AT EXETER.

MR. HOOPER held an inquest at Exeter on the 25th inst. relative to the death of George Morgan, a single man, aged 37.

Deceased, who was a cripple, was a clerk in the office of St. Thomas District Council. He had recently purchased a motor-tricycle. He was seen to mount the cycle outside the St. Thomas Fire Station on February 11th last, and ride off in the direction of Dunsford. He steered all right until he got to St. Thomas Church, when the machine turned over and he fell to the ground. He was picked up and taken to the residence of Mr. James, and after being seen by two doctors was driven home.

Dr. Woodman said he had known Mr. Morgan for nearly thirty years, and had operated on him for hip disease, from which he always suffered more or less. He was called to attend him a fortnight after the accident, and found him suffering from an alarming hæmorrhage from a long-standing wound in the hip. The hæmorrhage was caused by the accident. He was also suffering from a swelling of the left jaw, and had much difficulty in eating his food. Deceased rallied for a time, but died on Sunday last. It was a sad case, as deceased had saved up all he could in order to purchase the machine on which to ride to and from business, and the first time he rode it he met with an accident resulting in his death. He was inclined to think Morgan did not know how to manage the machine.

The jury returned a verdict of “Accidental death.”

THE motor races on the Prater course in Vienna were only very poorly attended.

ON Monday, May 1st, Mr. James D. Roots will read a paper on “Petroleum Motor-Vehicles” at an ordinary meeting of the Society of Engineers at the Royal United Service Institution, Whitehall.

MR. CONSUL ARMSTRONG, in his report on the trade of Lombardy for 1898, says that the most important bicycle manufacturers in that province are now turning their attention to automobiles. He adds, “this form of amusement or locomotion is far from being as popular in Italy as is the case in France.”

A BILL has been introduced in the New York Assembly for the licensing of the drivers of motor-carriages. If it becomes law, persons applying for licences must appear before an examiner, who is to be appointed by the Mayor. The examination is to include the practical operation of the type of vehicle the applicant intends to drive. A fee of one dollar has to be paid prior to the examination.

THE General Electric Automobile Co., having its head offices in Philadelphia, Pa., makes the following announcement: This company, controlling basic patents covering the application of electrical power to independently operate vehicles of all descriptions, is now receiving orders for the prompt delivery of “horseless” conveyances of the latest and most approved types. Its specialty is the lightness of its apparatus, with storage battery one-half the weight of other makes, and of greater efficiency.

THE Cambridge and Eastern Counties Automobile Company, Limited, was registered on April 17th by Mackrell & Ward, 1 Walbrook, E.C., with a capital of £5,000 in £1 shares. The first directors—to number not less than three nor more than nine—are W. L. Duck, F. W. H. Hutchinson, A. Macintosh, jun., W. C. Pamplin, and G. F. Whitmore. The objects of the Company are to deal in motor-vehicles, to hire them to the public, and to run services of motor-vehicles in the district. The public service is already at work, and the hiring business with the cars at present available is quite brisk, none of the cars being in the dépôt for any length of time.

MOTOR-TRICYCLE ATTACHMENT.

### FRONT SEAT ATTACHMENT FOR MOTOR-TRICYCLES.

WE herewith illustrate one of the front seat arrangements for motor-tricycles alluded to in our last issue. It is a very comfortable and wide seat, provided with rests for back, arms, and feet, and is fitted with best springs, pneumatic tire wheels being also provided. The illustration shows plainly the mode of attachment; and the ease with which a tricycle is thus almost instantly converted into a quadricycle goes far to explain the popularity of these attachments. In the illustration the appliance is shown as fitted to an "auto-cycle," but the Automobile Association, Ltd., inform us that it will fit any make of tricycle—in fact, they have already supplied quite a number of them to owners of Beeston, Barrière, De Dion, and other tricycles. When we last went to Prince's Road, Holland Park Avenue, to see the Automobile Association's, Ltd., stock, we were shown several different designs of these front seats, the Association, as is usual with them, trying their best to suit all tastes. The form shown in the illustration, therefore, must not be regarded as the only type made, but simply as an example of the attachment which is common to many forms of the actual seats.

It was announced some months ago that Messrs. Brown Bros., Ltd., of Great Eastern Street, E.C., the well-known metropolitan cycle and cycle accessory factors, had established a motor-car and cycle department. Judging from the catalogue lately issued, the firm has lost no time in organizing its new branch, for they announce that they are now not only ready to supply complete motor-cars and tricycles, but also motors and fittings to enable cycle-makers and others to build motor-tricycles. The catalogue above referred to gives particulars and prices of the parts of motor-tricycles they are able to supply, from a complete machine to the smallest detail thereof. A couple of pages are devoted to a list of the small parts they are stocking for the repair of motor-tricycles, while other pages are devoted to the De Dion motor, and hubs, bottom brackets, tires, chains, chain wheels, spokes, etc., for motor-tricycles, cars, etc. Altogether the list shows that Messrs. Brown Bros. are convinced of the future of the motor-vehicle industry, and that they mean to be well to the front in the business.

### MOTOR-CARS ON THE CONTINENT.

#### The Electric Cabs in Paris.

FROM one source, and we believe it to be reliable, we learn that the electric cabs in the Paris streets are having a great success financially and otherwise. Several of the *presstelegrams* in the daily newspapers, however, report accidents without number, even going so far as to say that an electric cab is more often seen disabled and in tow of another motor-vehicle than it is found in a state fit to convey a passenger. Our own Paris correspondent, however, does not substantiate these statements. He informs us that with the exception of one or two minor breakdowns, owing to trouble with connections between motor and battery, there have been no serious accidents, and that the vehicles run well, are well patronized, and carry out their duties with speed and regularity.

#### Motor-Cars in Brussels and Berlin.

THE re-opening of the Brussels-Longchamps Velodrome occurred on Monday last, when the inaugural meeting was attended by many notable supporters of the automobile and cycling worlds. Of the five races set down for competition, no less than four were won by Monsieur Louis Kühling. Throughout Flanders the automobile industry is now in full swing, gaining new adherents every day, both in the ranks of users and makers. In Berlin also a great number of races have been promoted, both amongst the *haut-ton* as well as for those in the ranks of semi-professionals. In fact, the automobile movement has reached such a pitch in Berlin that it is now on the *tapis* to establish a ladies' automobile club. Many ladies have already given their adhesion to this project, and it is meeting with hearty support all round.

#### More Accidents in France.

Two accidents are reported to have occurred in France on Saturday in connection with automobile vehicles. Fortunately, however, these did not result in loss of life or very serious injury to those who were unfortunate enough to be concerned therein. A motor-carriage driven by Monsieur Laurant was climbing the Tuilerie Hill on the way to St. Germain, the fashionable Paris suburb, when the

car suddenly stopped owing to the motor having "seized." Monsieur Laurant, it would appear, entirely lost his head, inasmuch as he did not let down his "devil," or hill-climbing safety bar, and as a consequence the vehicle commenced to run backwards down the hill at a great speed. Ultimately the vehicle was projected violently against a wall, after first having knocked down a bicyclist who was keeping to his proper course. The bicycle was smashed to pieces, and its rider, Monsieur Cuville, was at first believed to be dead. It ultimately proved, however, that he had only fainted, and he subsequently was found to be suffering from no more than shock and severe bruises. The second accident occurred at Niort; Monsieur Janvier, a municipal councillor, with his two sons was returning home after a long drive when he proceeded at a much greater rate of speed than was conducive to safety, for the reason that he was somewhat late for dinner. Unfortunately, the car ran over a large stone, with the result that it was partially overturned, and the three gentlemen were projected at least ten feet from the vehicle, which subsequently overtook them and rolled upon them; the car continued its course downhill until it met a tree by the side of the road, its progress being thus stopped, but not before the vehicle was very seriously damaged.

#### Automobile Exhibition at Boulogne.

ON the occasion of the holding of the congress of the French Association for the Advancement of Science at Boulogne-Sur-Mer from September 14th to 21st next, it is proposed to hold an exhibition of motor-vehicles. Monsieur Paul Dislère, who is organizing the show, will also deliver a paper before the Association dealing with automobilism from three points of view—viz., the motor, the carriage, and the travelling and control of the complete motor-vehicle. This gentleman, formerly a marine engineer, is quite competent to deal with the subject matters of his proposed paper, and it is anticipated that the Congress will be considerably interested in the views of Monsieur Dislère and that an instructive discussion will ensue. It is also rumoured, we hear, that the Mayor of Dover purposes to inaugurate a similar exhibition on the occasion of the meeting of the British Association for the Advancement of Science in his town. Doubtless some of the participants in the Boulogne show will be tempted to cross *la Manche* in order to take part in both shows.

#### The French Automobile Club's Exhibition.

APPLICATIONS for space at the French Automobile Club's Exhibition in the Tuileries Gardens still continue to pour in upon Monsieur Gustave Rives, the Director-General. Freedom from import duties and octroi dues has been secured for the vehicles of all foreign exhibitors that are imported into France and Paris for the show, and M. Rives is leaving nothing undone that is likely to contribute to the success of the undertaking. He has secured the patronage of Monsieur Delombre, the French Minister of Commerce, for the Exhibition, and this gentleman, in order to give additional *éclat* to the opening proceedings, has consented to formally open the show in his official capacity. Monsieur Delombre, apart from his official interest in the automobile industry as an important branch of the commerce of France, takes a keen personal interest in the advancement of motor road locomotion, and this he has amply demonstrated, both by his patronage of the Exhibition and his consent to take the leading part in the opening ceremonies.

#### Forthcoming Long-Distance Tour of French Automobilists.

In past years the French Automobile Club has organized a long competitive tour for automobile vehicles, which has generally taken place in July. This year, after some amount of vacillation, it has been definitely decided that the Club should not promote any such contest for

the present year. As a result, one of the French newspapers has stepped in to fill the breach, as has been the case on several previous occasions in order to inaugurate contests which the organized clubs have not seen their way to promote. This prominence of French newspapers, which is not entirely restricted to those devoted exclusively to sport, in promoting automobile contests, is peculiar to the Continent, and, so far as Great Britain is concerned, automobilists will probably have to wait a great many years before, say, the *Times*, the *Daily Telegraph*, or the *Standard* promotes contests and offers valuable prizes for competition amongst automobilists. The newspaper which is undertaking the duties of *organisateur* on the present occasion is *Le Matin*, but the patronage and support of the Automobile Club of France has also been given to the project; prizes will, furthermore, be provided by this organization. The contest is an international one, and is open to all classes of vehicles, these classes being distinguished in the official regulations as follows: (A) Carriages having seats for two persons at least, placed side by side; (B) motor-tricycles not exceeding 150 kilos. in weight when unloaded, neither fuel, stores, baggage, rugs, etc., being taken into consideration; (C) vehicles which are not included in either of the foregoing categories. Each vehicle competing in Class (A) must carry at least two persons, one of whom must be a member of the Automobile Club of France or of a club affiliated thereto, who will act as observer on behalf of the Club and the promoters of the competition. If the driver only is carried, a dead weight of 70 kilos. must be taken in lieu of the second passenger. The competition is timed to start at eight o'clock in the morning of July 16th, the competitors being dispatched at half-minute intervals. The course will comprise about 2,500 kilometres, and will be taken round the confines of France. In passing through towns regulations are made that the speed shall not exceed 15 kilometres per hour, observers being placed at the entry to, and outlet from, each town to check the speeds and to deliver to each competitor a time docket showing the time of his arrival and departure at each town, adjustments being made for the reduced speed when the time for the whole journey is computed. Other regulations are made in regard to the proper control and observation of the cars, including the provision of signallers at dangerous turnings and crossing of railways, canals, etc. It will be seen from the comprehensive programme that every possible type of vehicle can be represented in the contest. In this competition, at least, Monsieur Leon Bollée will not have cause to complain that his vehicle is debarred from taking part as a tricycle because of its weight, or as a carriage because the seats are not side by side, as it appears that Clause (C) is especially designed to embrace his vehicle.

#### Speeds in France.

THE French automobilist is always demanding that his vehicle shall possess a constantly growing speed, but there are now signs that, excepting amongst semi-professionals and mad-brained enthusiasts, this demand is decreasing. It is all very well to astonish the world by demonstrating that it is possible to travel at speeds equal to that of many express trains, but after all the greater number and the more sedate portion of the community desire comfort and safety rather than these dangerously high speeds. It is astonishing, therefore, to find the French manufacturers of automobile vehicles so much more ready to cater for the racing devotee than to pay attention to the needs of the much larger section of the public. Whilst automobilists in Great Britain have perhaps been saved from the "racing-fever" by reason of the strictness of the laws controlling the use of the motor-vehicle, the French *chauffeur* has in part been encouraged in his madness by the absence of properly authorised regulations. Times are changing, however, and already there are not wanting signs that in the near

future some restrictions will be placed upon the road-racer in France. Those who desire to see the automobile reach its true position in the commercial world will welcome these restrictions on racing, as they will tend to increased attention being paid to the purely commercial side of the industry.

## CORRESPONDENCE.

### THE WORKING OF THE BENZ CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I be allowed to give my experience of the working of two new Benz "Ideal" cars on the journey from London to Birmingham?

Mr. A. Campbell, of Llandudno, whom I met in London, kindly offered to drive one car, a No. 1 "Ideal," while I drove a No. 2. Accordingly, we left Oxford Street about 3.30 on Saturday afternoon, the 15th inst., in company with Mr. Plowright, of King's Lynn, who was taking home a No. 2 "Ideal," and ran with us to Barnet. Mr. Plowright left us there and proceeded to Lynn, while we drove on to St. Albans for the night. After stabling the cars we had dinner. We took a stroll round the town, speculating on our prospects of a fine day for our run to Birmingham.

The next day we started at 9.30—and so did the rain. We were soon wet through, and the roads became covered with mud, making the going very heavy. However, we decided to push on as one of the cars had to be delivered to a purchaser the next day.

Our first stop (10.15) was just after passing Dunstable, where I found Mr. Campbell, whose car was much faster than the one I drove, waiting for me and doing an impromptu dance to restore animation. After a few minutes' chat, and filling our pipes, we oiled the motors over and started again (10.50)—and so did the rain. We ran on to Towcester, arriving at the "Talbot" at 12.35—the rain descending in torrents.

We had dinner here, and after enjoying a big fire we had to face the rain again. We oiled up, and I gave the No. 2 a bucket of water, the tanks in No. 1 being almost as full as when we left London. Leaving Towcester at 2.30, we reached Coventry at 5.10, where we stopped for water, and filled up both tanks. *This was the first water given to the No. 1 since leaving London.* Leaving Coventry at 5.35 we arrived at Birmingham at 6.45. Our average rate for the whole journey was 14 miles per hour. I need not say that the cars were literally plastered with mud, and the way they came through it was marvellous.

Now, as regards "breakdowns," neither Mr. Campbell nor myself touched a single tool or did anything whatever to either of the motors beyond oiling. There was absolutely no stop other than those given above, the motors never having been stopped between the places mentioned. One of the cars went away on Tuesday, and I have since heard from the purchaser that one of the grease-cups on the counter-shaft had been lost. The other car goes away to-day, and is in perfect order. I hear from Mr. Plowright that he had just as successful a run, and I think the fact that three cars, new, and taken straight from stock, and without any special overhauling, made the run of over 100 miles through wind and drenching rain, over roads inches thick with mud, and making such good time, goes far to disprove the exaggerated statements which have been made against these cars.

I expect to make the run again this week with two more cars, and will give your readers the result of the further test.

Acocks Green, Yours faithfully,  
Birmingham, April 25th, 1899. A. J. ALDRED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested in your valuable paper, and I have been more interested in motors of various makes. After attending numerous shows, I at last made up

my mind to purchase a Benz "Ideal" No. 2 car, '99 pattern, and gave the order for same in January. I received notice from Messrs. Hewetson, Limited, to say the car was ready, and on Saturday, the 15th, at 4 o'clock, we started on our journey to King's Lynn in company with two other cars bound for Birmingham. At Barnet we parted company and went on our journey to Stevenage and stopped the night at the Lion Hotel. On Sunday, on looking out of my bedroom window, I found rain was descending, and my feelings can be imagined as this was my first run in charge of a car. However, we started, like sportsmen, at 9.15 for Cambridge, although it was still raining. We did not stop, but went through to Littleport and lunched at the Granby Hotel. We left at 2 o'clock and arrived at King's Lynn at 3.45, thus making only one stop from Stevenage to Lynn, about 77 miles, the roads being very bad a great part of the way. After tea we had a run round Sandringham, left Lynn at 6.10, drove round the park, and returned home at 7.45. On Monday we had a short run, and on Tuesday also. On Wednesday we journeyed to Hunstanton, and after various short runs returned via Sandringham. On Thursday again to Hunstanton, and witnessed opening of new post office, and were busy giving the public short trips during the afternoon. Hunstanton is very hilly, and we had three persons in the car each time, which I think is giving it a good test. On Friday we drove to Wisbech. On Sunday we had a long spin, and lost ourselves in various bye-ways, experiencing bad roads and cruel hills, and had to resort to first speed, which appears to be invaluable. The mileage run from Saturday, 15th, to Sunday, 23rd, totals 478 miles, and we have not had to lighten our load or walk up any of the hills which we have had to contend with in a run of this kind. Of course, the time is young, but to all appearance the Benz car is certainly a marvel. I should like to see better fitted connections for the electrical wires as they have to play a very important part, but this can be rectified for a few pence by having solid eyes instead of the wires being twisted round the screws of the coil. For two-thirds of the journey of 478 miles the car has had full loads, and, speaking broadly, I am delighted with it, and it more than meets my expectation. Perhaps it would be right for me to mention that I am a practical engineer, and have had a great amount of practical work with gas engines and electrical work generally. Probably this may have given me some assistance in handling the motor properly.

Yours faithfully,  
King's Lynn, Norfolk. JAMES PLOWRIGHT.

### SHALL THE N.C.U. CONTROL MOTOR-VEHICLE RACING ON THE TRACK?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have most carefully read the correspondence from Mr. C. G. Wridgway which has appeared in your recent issue, and what I cannot understand is why do the N.C.U. object to answering the questions which he asks. They seem to me perfectly reasonable, and questions that any one would ask before signing some document in which one's private affairs are rather deeply probed into.

As far as I understand the matter, here is a private user of a motor, not in the motor trade or in any way interested except as an enthusiast, and because he wishes to compete in a race he has to be asked a number of questions, which, however necessary they may be so far as cyclists are concerned, I cannot see their application in this case.

The whole matter seems to me to be on a par with that of some other correspondence which I saw recently with this cyclists' body, who laid down a rule or regulation in regard to motor-cycling, and then when asked to define it were unable to do so!

I myself am only an unattached cyclist, but I cannot understand why those who govern our sport do not elect honorary officials who would carry out the rules of the

Council in a manner that would be intelligent to the ordinary onlooker. At present, to both myself and my friends, it is shadowed in mystery. Simple questions are asked, and nothing but voluminous correspondence seems to result. Can you tell me what is the matter?

Yours truly,  
A. E. ASHTON.

[To our minds the N.C.U. are endeavouring to control a matter of which they at present possess but very little knowledge, and, moreover, have sought to make the racing motor-carist amenable to similar regulations to those controlling the racing cyclist. When the N.C.U. gain additional knowledge they will doubtless alter these regulations, but the whole crux of the matter, in our opinion, rests on the question whether the N.C.U. shall control motor-vehicle racing. To our minds they should not do so. Although we are not supporters of motor-vehicle racing, we think this section of "sport" should be controlled by a body elected from the ranks of those taking part in the automobile movement. In regard to the conducting of the business management of the N.C.U., we think some improvement is to be desired.—ED. M.-C. J.]

#### AN IDEAL MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am an engineer and a subscriber to your valuable paper, and send you the enclosed as a sort of ideal which I have set myself in motor-car making. It may also be of interest to your readers, especially if other people will also state their ideas and ideals:—

##### THE CAR.

1. All weight should be kept as low as practicable.
2. Pneumatic tires and ball bearings must be universally used.
3. All bearings should be supported on both sides—especially wheel bearings.
4. The steering must be positive—no gearing—ball bearing, and of the double cycle head type. The wheels must turn at right angles to the frame, and the whole apparatus must be supported in every direction, for all strains—fore and aft, up and down, sideways, and twisting.
5. The driving must be in the centre of wheel axle, on a differential gear arrangement, like the present tricycle.
6. A broad belt chain should be used. Renold's laminated chain, not less than 2 in. wide, is a good type.
7. The frame must be rigid in design, well stayed for all strains—fore and aft, up and down, sideways, and twisting strain. A spring quality of steel should be used, so as to give the frame a high movement of elasticity, avoiding permanent sets. No springs are necessary, except springs to axle boxes, allowing up and down motion only.
8. The body of the car—that is to say, the seating arrangement—must be slung on an entirely separate set of springs. There must be no rigid connection between car and body.
9. Steering should be carried out by means of a horizontal wheel.
10. Wheels should be fairly small—say 30 in.—all four of equal size, and run in two tracks only.
11. Steel should be used exclusively—no wood at all, except in body construction.
12. Plate steel forms a good material for frame construction—better than tube.
13. Built steel wheels, steel rims, and tangent spokes are a necessity.
14. Large drum brakes are also a necessity.
15. All gearing should be cased in, and run in oil.

16. Weight should be equally distributed on all four wheels.
17. Rear wheels should drive, and front steer.
18. Chain adjusting should be done by means of jockey pulleys; no shifting of main bearings should be necessary.
19. All chain wheels should have deep shrouds to steady running of chain.
20. Pneumatic tires should have tangential fabric.
21. Tires should be securely fastened to rim, so as not to come off in case of puncture.
22. Keep car narrow and long, rather than wide and short.

##### THE MOTOR.

1. The motor should be self-starting.
2. It should run at any required speed without gearing.
3. It should drive direct on rear-wheel axle without intervention of gearing.
4. It should be possible to considerably overload it for short periods.
5. It should be as simple as possible.
6. All bearings should be constantly lubricated.
7. Pure rotary action is necessary—no thrust action.
8. It should start with full load.
9. It should reverse at all powers.
10. It should be noiseless in operation.

##### THE PRIME GENERATOR.

1. It must be capable of being left any length of time without attention.
2. It must be capable of standing great taxes for short periods.
3. It must not generate when at rest.

##### MOTOR-CAR AXIOMS.

1. The body of car is a secondary matter, and in all respects it should be remembered that a motor-car is being built, not a horse carriage adapted to carry a motor.
2. Wherever possible straight lines in construction should be used.
3. In designing, always first design regardless of expense; then consider commercial methods.
4. Be quite regardless of existing methods, either in motor-cars or, worse still, carriages; most of them are wrong. Use your own ideas, mixed with common sense: don't rake up other people's ideas.
5. Have nothing to do with *puncture-proof* tire devices.
6. Use best materials, and never consider waste.
7. Use no compensation joints in frame of car—they are wrong in principle.
8. Always remember that in machinery rigidity is one of the first points to consider.
9. Take no notice of what is said about rigid frames. People say the four wheels of car can never be on the ground at once with a rigid frame; the spring axle boxes and pneumatic tires will see to this for you.
10. Don't worry about lightness; first design, then cut down weight.
11. Never have one handle to do about fifty operations. Remember that you will have fifty causes to locate if anything goes wrong with it.
12. As a last word, always bear in mind that friction exists everywhere, and that what you put into a machine in power is reduced when it comes out in work. Don't try to make a perpetual motion car!

Hoping you can find space in the correspondence section of your paper for the insertion of this letter,

Hampstead, N.W.,

April 25th, 1899.

Yours truly,

A. S. GOODWIN

## THE FAILURE OF A PRESSURE BURNER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would esteem it a favour if you could enlighten me as to the following:—

I went last Saturday for my first spin on an Ariel motor-tricycle, and after riding some three miles I found that the motor would not work. I then dismounted to examine the cause of the sudden stoppage, and found that the ignition tube was not heated to its full extent. I examined the reservoir which contains the petrol under pressure, and which I found contained a great pressure, but the flame did not seem strong enough to heat the tube. I then unscrewed the Bunsen tube and examined same closely, but could not find anything wrong with it. I then refitted it and lighted up, and found that it worked well for about 200 yards, when another stop took place, with the result that I had to give up my ride in disgust.

Can you, with these particulars, throw any light on what was the cause of the failure of ignition tube not heating?

Thanking you in anticipation,

Yours faithfully,

"NOVICE."

Dublin.

[We are afraid "Novice" suffered from one of the inherent faults which attend tube ignition and pressure burners. From the particulars given, however, it is not easy to offer an opinion as to the real cause of the burner not acting. There are several causes which might give rise to this state of things: (a) Was there a leakage between the burner and the pressure tank? (b) Was there a free passage for the petrol between the tank and the burner? (c) Was the control cock free from obstruction? (a) This can be determined by the leakage of petrol at any joint. (b) This can be determined by removing the burner and turning on the control cock, when, of course, the spirit will be projected upwards. (c) If (b) is answered in the negative the point of obstruction can be determined by a similar test between the pressure tank and the control cock. If none of these tests locate the fault, the burner itself must be examined thoroughly. The wick must be tested to see that it is not too tight and that it is in good order. The jet of the burner must be examined to see that no small obstruction has lodged therein, and in the event of such obstruction being found a small watchmaker's broach or "pricker" should be used to remove the obstruction. In every probability the last mentioned was the cause of the failure. Small impurities and particles are frequently found in petrol, and the pressure in the tank forces these onward until an obstruction is formed. Our correspondent's examination possibly displaced the obstruction temporarily, but the renewed pressure probably thrust it forward again. Every care should be taken to filter the petrol supplied to the burner tank; the time occupied in this apparently wasteful proceeding will be compensated by the freedom from subsequent trouble.—ED. M.-C. J.]

## THE N.C.U.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I enclose you a rather curious letter I have received from a body called the "National Cyclists' Union," and also copy of my club's reply.

I am loth to trouble you in the matter, but I feel that this attempt to control a purely sporting gathering, and one that is so essentially outside any connection with cycling, must be the work of an apparently energetic but undoubtedly misguided body.

The position is that the Motor-Car Club are holding an open competition on May 6th at the Crystal Palace, for the purposes of bringing together all the various types of motor-carriages, to give the owners and all those interested in the motor industry an opportunity of testing the various types and ascertaining which type is the most suitable for every-day work upon the road.

The test includes many starts and stoppages over a measured distance and on private undulating roads. I ask, sir, what right has the National Cyclists' Union to interfere with such a meeting? Here they actually dare to ask the gentlemen driving their carriages in these contests to take out a licence. This, on the face of it, seems most insulting, but when I tell you that before this licence can be obtained the applicants must fill up a form in which has to be stated their age, occupation, etc., and a large number of other equally objectionable questions, the impertinence of this body can be appreciated.

Motor-Car Club, Holborn Viaduct, Yours truly,  
London, E.C., April 24th 1899. FRED. W. BAILY.

N.C.U. to MOTOR-CAR CLUB.

To F. W. Baily, Esq.

DEAR SIR,—The London Centre issued to you a permit to hold professional races at the Crystal Palace track on Easter Monday last. It seems you have abused that permit by running at the same meeting a motor-cycle race between Wridgway and Rigal, both unlicensed riders, and I shall be glad of some explanation to lay before my Committee.

With reference to your meeting to be held May 6th, I would point out to you that in the event of any races, or time trials which would count as records, for motor-cycles, it would count by the Union as an unregistered meeting, unless a permit were taken out and the riders licensed. No Union official may officiate, and any rider holding a licence, either professional or amateur, would be disqualified.

4 Holmwood Road, Yours truly,  
Brixton Hill, (Signed) W. METSON,  
April 19th, 1899. Hon. Sec. London Centre N.C.U.

MOTOR-CAR CLUB to N.C.U.

The Hon. Sec., London Centre,  
National Cyclists' Union.

DEAR SIR,—Referring to your letter of the 19th, addressed to me personally, of course you quite understand that I am not holding any races personally. The control tests, etc., which I am holding, are run by the Motor-Car Club in conjunction with the Crystal Palace Co. It is, of course, obvious to you that gentlemen who own motor-cars and who will drive in these contests are not likely to have any inclination to take out cyclists' licences, either professional or amateur, and I think that if you will get your Committee to carefully consider the matter, they will see for themselves that it would be unreasonable to ask them to do so.

Here we have a Motor-Car Club getting up some competitions to give private owners an opportunity of testing their vehicles in a very complete manner, and you, it seems to me in a particularly interfering spirit, if I may be excused the term, write to me, I suppose as the Secretary of the Motor-Car Club, and say that these gentlemen must take out either amateur or professional licences. I cannot see why the Motor-Car Club should ask the N.C.U. if they may hold these competitions, as I utterly fail to see by what right you should ask to have any jurisdiction over it any more than if these races were held in the same carriages propelled by horse power or animal power instead of by engine power.

I will, of course, lay this portion of your letter before my Committee, who, whilst anxious to act in conjunction with the governing body of any sport or pastime, are bound to resent what seems to be officiousness on the part of some person or persons in a manner which would never have been contemplated or advised by the great body of cyclists who go to make up the N.C.U.

Yours truly,

F. W. BAILY,  
London, E.C., April 21st, 1899. Hon. Sec. Motor-Car Club.

## THE PENNINGTON v. MORS CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is with pleasure we note that the Automobile Association are willing to run their four-cylinder Mors car against our two-cylinder car, each carrying two passengers and making the twenty-five ascents up Shapfell, commencing at a point ten miles south of the summit, the car making these ascents in the lowest aggregate time—a distance of 250 miles of hill climbing—to be the winner. As stated before, we have no intention of running our 125-guinea one-cylinder car against the 380-guinea four-cylinder Mors in this contest, as such a match is obviously unfair; besides, this one-cylinder car is only designed to run at a moderate speed, so as to keep within the reasonable limits of the law.

We object, however, to any second car accompanying the competitors on the run, as this might lead to pocketing or other interference—unintentional or otherwise; and we want this to be a straight, fair run between car and car. We are quite content with entering one car in the race, and we

think our competitors should also be satisfied with a single representative; or what is the good of the car that cannot make a 250-mile run? As many of the Automobile Association's friends as they please, or ours, may see the cars either at the summit or at the commencement of the ascent, and while, being a public highway, we cannot prevent any one going over the course, we appeal to all lovers of fair sport not to follow the cars or to approach them so near when they are on the ascending trip as to in any way interfere or add to the chances of accident. In motor racing, as in yacht racing, the competitors may be seriously handicapped by other craft getting in the way. Everyone will remember the heart-burning and bickering which arose over the last contest for the America Cup, and, on a small scale, we would not wish for anything of the same character to happen in this motor-car contest. We only want a fair and square run, and if the Mors car proves the better car we shall be the first to admit it.

While we are about it, and since it will be necessary to have two independent timekeepers, one to note the commencement of each run and the other to register the arrivals at the summit, we do not mind meeting the Automobile Association's apparent wishes, and adding to the interest of the spectators and also of the motor-car public who may read of the event, by entering one of our motor-tricycles against one of the motor-tricycles which the Automobile Association are pushing—the Barrière, for instance; these tricycles to make the same number of ascents as the motor-cars. We throw out this suggestion as an additional means of adding to the interest of the event, although from all we can hear a hill-climbing contest such as is now to take place is creating amongst motor-car users such an interest as perhaps no other form of motor-car contest would raise, for it is notorious that the glaring defect of motor-cars up to now has been their lack of hill-climbing qualities; besides, on such gradients as the cars will encounter it is hardly likely that the legal speed will be much, if at all, exceeded.

Yours faithfully,

Manchester.

PENNINGTON & BAINES.

## EFFECT OF "JARRING" ON RIDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers state their experience with regard to the jarring effect on the spine in using a motor-tricycle at high speed on roads which are "lumpy." I find after thirty or forty miles at fast speeds on a De Dion tricycle if the road be lumpy—not rough or stony, but frequently hollowed—that the succession of shocks on the spine is so great that I have been unable to put my shoes on.

It seems to me that no saddle or seat yet used is really suitable for use on a De Dion tricycle running at twenty or twenty-five miles an hour with pneumatics blown hard, and I shall be glad to hear from any one who has had the same trouble, and also if they have found a remedy. I did twenty-three miles through thick mud and rain over a hilly route yesterday in 1 h. 25 m., which I thought was good travelling, but my appearance on arrival was not elegant, as there were no mudguards over the driving wheels, and I was a mass of mud from head to foot. There is little doubt that the 1899 De Dion with electric ignition is a perfect machine.

I have had two years' experience of tricycles—first, electric with accumulators, then tube ignition, and now electric ignition and primary batteries—and I would not on any consideration again go back to the lamp and tube, which I consider inefficient, troublesome, and dangerous.

Yours truly,

Bradford, April 25th, 1899.

JAS. ED. TUKE.

THE Automobile Club of Flanders is in a flourishing condition, counting at present more than sixty active members.

## SCOTTISH NOTES.

### The Benz Car in Scotland.

I HEAR that the new form of Benz car, with its epicycloidal hill-climbing gear, has had a successful trial on some of our hilly roads. The pace up hill is, of course, very slow when this gear is in use, but apparently no hill has been able to overcome the mechanical perfection of the arrangement. It would appear that this addition to these handy little cars will considerably advance their sale in these hilly districts.

### Glasgow Exhibition, 1901.

THE last years of the nineteenth century will be remembered in history for many important and remarkable things. Not the least important of these will be the inauguration of the change in the methods of road-locomotion and transport throughout this country, which at present we speak of as the advent of the motor-car or self-propelled vehicle. A great International Exposition, as everybody knows, is to mark the opening years of the new century in Scotland—the Glasgow Exhibition of 1901. The ceremony of cutting the "first sod" in connection with the erection of the noble pile of buildings which is to house the treasures of art, science, and industry, which will then be poured into Glasgow from every quarter of the globe, was performed on Saturday last by the popular Lord Provost—Sir David Richmond. As was to be expected, the mechanical section of the coming great enterprise is receiving special attention, and among many attractions which will there be offered one of the most important will be the motor-carriage section. That the exhibits will be of great interest and importance is certain, for, at its present rate of growth, when the Exhibition year arrives the motor industry will be found to be one of considerable magnitude and the public interest greater than ever. I understand that the committee are considering the practicability of providing facilities for showing motor-cars in motion, and it is sincerely to be hoped that no insuperable obstacle will come in the way of this, for it is now generally accepted that a show of motor-cars at rest is of little practical utility. To have an opportunity of giving to the thousands of people who will visit the Exposition a practical demonstration of the capabilities of the various systems and makes of self-propelled vehicles is of the first importance to the exhibitor and public alike.

### The Scottish Automobile Club.

ARRANGEMENTS, I am informed, have now been made for a preliminary meeting in connection with the formation of a Motor-Car Club for Scotland, and I have been asked to announce to the readers of this Journal that a meeting will be held on Wednesday, May 3rd, at 2 o'clock, in the chambers of Messrs. Mitchell & Smith, C.A., 59 St. Vincent Street, Glasgow. To this all interested in the automobile movement, whether owners of motor-cars or not, are cordially invited, and I trust the meeting will be well attended and be thoroughly representative of Scotch automobilism, in order that the club may get a good start. The feeling appears to be very general that the new club should take the form of a branch of the Automobile Club of Great Britain and Ireland, on the lines of the Liverpool Branch (previously known as the Self-propelled Traffic Association, Liverpool Branch). Now that this matter has taken definite shape, so soon as the club has got to work I look for a very large increase in the number of converts to automobilism in the North. As was remarked in last week's Notes, there is room for such a development in the Glasgow district, which is certain to be the centre that will first benefit by the institution. Make a special note of the date of the meeting—Wednesday, May 3rd, at 2 p.m.

**Beeston  
versus  
Daimler.**

ONE day last week I saw Mr. John Stirling (of Stirling's Motor-Carriages, Ltd.) spinning over Douglas Moor (Lanarkshire, not Isle of Man) on a Beeston motor-tricycle at a very rapid rate. I was myself driving a fairly fast "Daimler" car, but all my efforts to overtake him were without success, and I had ultimately to give up the chase, which had extended to close on twenty miles. The look of amazement which I observed on the faces of cyclists passed on the way, as the tricycle left them behind on the hills up which they were slowly grinding, was very amusing. The motor ran so smoothly that I fancy several of them hardly realized the fact that the tricycle was self-propelled, until it struck them that the rider was not pedalling. The tricycle is at present more of a novelty in Scotland than the larger type of motor-vehicles, and consequently the small machine I observed excited more interest and wonderment than the orthodox Daimler in pursuit. I was immensely pleased to see the success of the little tricycle, as there is certain to be an ever-increasing demand for a light, fast, and cheap motor-vehicle. It would, I think, remove one common objection to the tricycle if the makers would at once adopt a satisfactory cushion seat in place of the uncomfortable saddle supplied. In France a pneumatic seat with back rest attached is largely used in place of the ordinary saddle. A similar seat might be with advantage put on all English-built machines, more particularly those designed for ordinary touring and not especially built for track racing.

**The Highland  
Agricultural  
Show.**

THIS great show falls to be held this year in Edinburgh, July 4th to 7th, at Prestonfield Grounds, and the presence of H.R.H. the Prince of Wales, president, will on this occasion be a big attraction. I understand it is the intention of some of the Scotch motor-car firms to take the opportunity of exhibiting examples of their latest productions in self-propelled carriages and transport wagons suitable for agricultural purposes.

**Motor Pacing.**

THE 1899 cycle racing season opens on Saturday, when motor pacing will be introduced for the first time in Scotland, at Celtic Park, Glasgow. This is sure to add a new interest to the sport. Motor-cycle events will most certainly follow at a very early date.

**Improved Weather.**

WITH the arrival of the long looked-for improvement in the weather this week, automobilists have had a good time, and I hear of the accomplishment of many enjoyable excursions.

**The Advance of  
Automobilism in  
Scotland.**

As a sign of the advance in automobile locomotion in Scotland, it may be mentioned that the Falkirk District Motor Company have no less than thirteen cars in daily service, and none of them are ever wanting customers. This demonstrates that, given sufficient enterprise, there is a vast and profitable field for the employment of motor-vehicles for such purposes, and it is astonishing that the profitable nature of motor-car hiring has only recently been recognised. Certainly some movement is now taking place, but there are still vast districts practically unexploited.

"BROWN HEATHER."

COULSON'S SYNDICATE, LTD., has been recently registered with a capital of £10,000 in £1 shares. It is formed to adopt an agreement with H. Maw, and to manufacture, sell, and deal in cycle, motor-cars and similar carriages.

**AN IMPROVED LONGUEMARE  
CARBURETTOR.**

A FORM of carburettor which is very largely used in France, in connection with petroleum-spirit motors, and which is already well known in this country, is the "Longuemare," made by Ve L. Longuemare, of 12 Rue du Buisson-St.-Louis, Paris. The device, which was shown

FIG. 1.

at the Motor-Car Exhibition at the Agricultural Hall, Islington, in August last year by the Automobile Association, of Holland Park Avenue, W., has lately been improved, and

FIG. 2.

we are now able to illustrate and briefly describe the latest form of the carburettor. Referring to the accompanying illustrations, Fig. 1 is a vertical section of the device, while Fig. 2 is a transverse section of the carburettor portion. Three main parts are comprised in the apparatus, the auto-

matic supply chamber, the carburettor proper, and the mixture regulating valves. The supply chamber *R* (Fig. 1) is connected by means of the pipe *A* up to the main storage tank. Within the chamber *R* is a float *F*, free to rise and fall as the level of the spirit in the chamber varies. Below the float are pivoted two small levers, with counter-weights *ll*, so arranged that when the float *F* falls to the bottom of the chamber, the counter-weights are pressed down, the inner ends of the levers *ll* thus rising and lifting the weight *p* and consequently the needle, so opening the spirit admission pipe *A*. The spirit then passes into the chamber *R*, and flows through the pipe *a* to a small chamber in the carburettor proper, where it is slightly heated, a portion of the exhaust gases from the motor being caused to pass through the chamber *b* *C*. Under the action of the aspiration stroke of the motor and the warm air drawn in through the pipe *D*, the spirit passes up into the chamber *I* through a series of wire-gauze discs. The chamber *I* is closed at the top, but is provided with a number of holes *h* through which the spirit passes into the chamber *V*, where it is intimately mixed with the warm air entering by the pipe *D*. It will be noticed that the lower portion of the walls of the chamber *V* are pressed inwardly, this being done to increase the speed of the indrawn air, so causing it to draw with it the required quantity of spirit. The mixture thus formed passes upwards through a second series of wire-gauze discs *T* to further intermingle the air and spirit, to the regulating valve. The latter is provided with two handles or control levers *K* *K'*, the former regulating the quantity of carburetted air allowed to pass along the pipe *O* to the motor, while by means of *K'* the richness of the explosive mixture is varied as desired by the admission of pure air through the side opening *m*. The two handles or levers *K* *K'* are so arranged that they can, by suitable connecting levers, be manœuvred from the conductor's seat. It is claimed for the new carburettor that while it is relatively very light its parts are simple and of ready access; that it is regular in its operation, and cannot easily get out of order.

## THE LONDON STEAM OMNIBUS IN 1833.

(Concluded from page 112.)

WE herewith conclude the account of the Peterborough Court conversation relating to a mythical London steam omnibus of 1833. The Editor of the *Mechanics' Magazine* frequently published accounts of these imaginary soirées, the "proceedings" of course consisting of ironical and satirical skits upon matters of public importance at the period. The steam omnibus of the "early thirties" was invariably treated with consideration, and it was only when some "know-all" loudly proclaimed his ability to surpass Hancock in designing these vehicles, of course without performing the task, that the Editor of the *Mechanics' Magazine* took upon himself to pillory the steam 'bus in his accounts of these mythical conversaziones.

RATTLER: Well, after being detained for this purpose about half-an-hour, off we started again, and were going in beautiful style down Notting Hill, when the engineer happening to reverse too suddenly the action of the steam to allow a large carrier's wagon to pass, one of the cylinders gave way, with a tearing noise, like to the rushing of a prodigious rocket. Stopped to examine into the cause, and discovered that the fracture was owing to a flaw in the iron employed. Only think how provoking! Who could provide against such a disaster as that?

SOL. SEC.: Who, indeed, considering how *notoriously bad* all our English castings are!

RATTLER: Fortunately there was a smithy close at hand, and the damaged cylinder was soon made secure by a strong hoop of S.C. iron. Started once more, and went on very smoothly and steadily through Shepherd's Bush and Hammersmith, as far as Holland House, when cousin Harriet, who was with us—

EDITOR: Cousin Harriet? Whom do you mean? Not Harriet Norwich, the famous tale writer?

RATTLER: Yes, the very lady. Harriet, you must know, is writing a tale of locomotion, to be called "The Pack Horse and Fire Steed," and, hearing of my being invited to go on this steam excursion, she insisted on accompanying me, in order that she might collect some real matters of fact for her story. Well, as I was saying, when we reached Holland House, the thought struck cousin Harriet that as her friend, Lord Brougham—

JUNIUS REDIVIVUS (*emerging as usual from a cloud*): Friend—Alas! alas!

RATTLER: Was then dining with the noble owner of the mansion, it would be paying him a pleasant compliment were we to steam up to his house, and show off our engine. Having mentioned her wish to Speed, he at once consented, and off we turned from the road. Luckily the carriage never performed better than just at this time. Oh, how gallantly it went up the avenue, snorting like a war horse, and stopped all of a sudden in front of the banquetting room, as if under the curb of some imperial rider! In an instant the dinner table was deserted, and every window was filled with the wondering guests. Even Holland himself, though all on crutches, was there, smiling blandly on this modern wonder; while Brougham, at his side, gave one of these ecstatic twitches of the nostrils which seem to say, "What do you think of my thunder?" Holland was observed to whisper to the Chancellor, who was observed to whisper to some one else, who in a minute or two after was seen to advance from the house, "with measured steps and slow," towards the carriage: "Is not Miss Harriet Norwich here?" he asked; on which occasion cousin rose and answered in her usual abrupt way, "Yes, sir, Harriet Norwich—the Norwich—is here; what are your commands?" "I am commanded, fair lady, by my Lord Chancellor, to say that he has been requested by my Lord Holland to beg that you will do him the honour to alight and partake of the hospitalities of his humble mansion." Scarce had the words escaped the minion's mouth ere Harriet had descended from the carriage and accepted Mr. Chamberlain's proffered hand, simpering the while, "*Honour*,"—"Humble mansion"—"Oh, dear!" Feeling somewhat queer at being thus left a spectacle for the great folks in the great house to gaze at, I called out to Harriet, "I say, Coz., what's to become of us, while you're doing the grand there? Can't we go with you?" "Go with *me*," she replied, with prodigious disdain; "no, sir, I go alone; you and your friends *must* steam about there in front of the house for a while; I shall return to you presently." On this, a gentleman in the after-part of the carriage, who had, ever since our turning off the road, been grumbling excessively, and who I understand is a retired major, of the name of Barbette—

BARBETTE: Yes, sir, a retired major; but ever, as you will find, a most forward gentleman when there is any point of honour or of good feeling to stand up for. I did grumble, it is true, and well I might, methinks, at being shown up in this way, like some great Bengal tiger, for the entertainment of such an apostate coterie as that of Holland House.

RATTLER: I don't blame Major Barbette for feeling annoyed at the circumstances. I was a good deal hurt myself at my cousin's cutting us in the way she did. But, as I was saying, when the Major heard Miss Harriet say that we *must* steam about in front of the house while she paid her respects to the party within, he broke out into a fit of most ungovernable rage, and swore that he'd be d—d if we should. Speed tried to pacify him, but in vain. The Major protested that he would make a personal affair of it with Speed if he did not steam off instantly, and being warmly seconded by Mr. Testall, Mr. Crucible, and some others of the party, Speed was

forced to yield. So off we set at full speed down the avenue, while Cousin and her noble friends, imagining, I fancy, that we were only taking a little turn for their amusement, waved their handkerchiefs and clapped their hands, as if in high glee at the sight.

EDITOR: And were you really so rude as not to return for your fair cousin?

RATTLER: 'Twas her own fault; she gave us the cut arrogant, and we did but give her the cut valedictory in return.

CRUCIBLE: Had we returned, Mr. Editor, probably we should not have been here to-night, and that will with you, I am sure, be reason sufficient for the course we took. We left the fair lady in company she preferred, and which she is known to be proud of.

RATTLER: Soon after regaining the road, the engineer complained of a great deficiency of steam. Stopped to examine, and found that the infernal clinkers had again nearly choked up the fire bars. Stoker set to work to clear them, but using his poker too roughly he broke two of the bars right through the middle. What was to be done? No fire grate, and four miles yet to do. Observed that there was a marine store-shop hard by. Speed was sent in to rummage for something that might serve by way of substitute, and returned with a prodigiously large gridiron. Just the thing, however—fitted in to a nicety. Asked the store-dealer how he came by such a monster. Answered that he had bought it of a queer old gentleman who lived in the neighbourhood, and had it stuck up on the front of his house, by way of sign or ornament, for several years, but had lately parted with it for the sake of some new whim. Asked his name, and was told "William Cobbett." (Great laughter). You may laugh; we all laughed, too, till our sides were like to split. The Major, who was quite restored to good humour by the incident, has been chuckling ever since at the thought of it.

EDITOR: Well, it served your purpose, you say; so I hope you got on without any more such interruptions. 'Twas high time.

RATTLER: Yes, we did get on at last, and in good style. Never stopped once after leaving Kensington till we reached your door here, threading our way through the crowded thoroughfares of Piccadilly and the Strand with an exactness and facility which called forth universal admiration. The only thing we had to find fault with in this latter part of our excursion was the noise and shaking, which, on our getting upon the stones, became almost too much to bear. Must say that such jolting, and rumbling, and grating, and creaking I never met with in any carriage in all my life before. The more surprising, too, that the carriage was mounted on springs of an improved construction, invented by the company's engineer. Was assured, however, that it was all owing to that unfortunate priming of the cylinders in the first instance, for the water, getting where it should not have gone, washed away all the tallow, and that, you know, gentlemen, is a thing which might happen to the best of engines.

SPEED: I believe I may say that, upon the whole, every one of the party felt convinced, by our excursion, that the engine is a very admirable engine, and that the main difficulty of travelling by steam on common roads is now completely overcome, leaving only such a mastery of the minor details to be acquired, as practice alone can impart, to render steam carriages by far the safest, cheapest, and most expeditious vehicles that can be used on common roads.

SIR DI.: I, for one, must distinctly dissent from that opinion. I have remained silent during Mr. Rattler's amusing account of our excursion in order that I might see how far ingenuity could serve to give an air of triumph to what I must consider as, upon the whole, one of the most discouraging experiments ever made. Neither,

perhaps, should I care to make any remark on the plausible explanations he has offered of the various accidents and obstructions we encountered, but that they are so characteristic of the whole class of steam carriage experimenters, with scarce a single exception. It is always with them some minor or accidental circumstance that is to blame for every failure—now the water, now the fuel, now the iron, and anon some little screw; but never the general principle of the machine itself. Every carriage which has yet made its appearance has been for a time the very thing; but although full seven years have elapsed since we have been tantalised with such announcements, we seem to be nearly as far as ever from witnessing the general application of steam power to travelling on common roads. What ought we, in reason, to infer from all this, but that there is some real difficulty in the background which has yet to be overcome? I am not qualified to offer any critical opinion as to the capabilities of the particular carriage now in question, for I am no engineer, and but little versant in such matters. It may possibly be all that Mr. Rattler and Mr. Speed have represented—the "very thing" in reality at last; but I have my doubts, and I will briefly mention on what grounds these doubts rest. First, there was no proof that the water was foul, and but little probability that so serious a blunder should have been committed. Neither was there any proof that the coke was impure, nor that the iron was defective. Now if the water, and the coke, and the iron were all unexceptionable, what must follow but that it was the natural action of the machine itself—the great friction to which it was subjected, and the inefficiency of the means employed to obviate or modify the effects of that friction—which caused the priming and the clinking, and all the stoppages and accidents of which they were the occasion.

DUBIOUS: I, too, must beg to be classed among the dissentients, and for this further reason, in addition to those which have been so well stated by Sir Dionysius, that the clinkers which Mr. Rattler affects to treat so lightly would have been procured whether the coke were pure or impure, and that they constitute, in fact—if I am rightly informed—one of the greatest practical difficulties which steam carriage speculators have to contend against.

EDITOR: It is certain they do; but I was lately told by Mr. Hancock that he had devised a method by which this difficulty is completely obviated.

DUBIOUS: Let us hope this may prove true.

SOL. SEC.: Meanwhile the sum of all that has been said seems to be that this new carriage "Eclipse," which was to eclipse everything that had gone before it, has done no more than has been done twenty times before, and in many instances a great deal better.

EDITOR: The mere practicability of travelling by steam on common roads is a thing which no longer requires demonstration. All that is now wanted is satisfactory evidence that it can be followed up for a continuance with advantage.

CRUCIBLE: And for that purpose we must have a fuller and fairer account than has ever yet been furnished, in any one instance, of the expenses of working such a carriage, under the various heads of engineer and assistants, water, fuel, repairs, interest of capital, etc.

SIR DI.: "So much for Buckingham!" Let us now talk, if you please, of something else.

---

THE Liverpool Self-Propelled Traffic Association (the local centre of the Automobile Club) will on May 1st issue forms of entry for the heavy vehicle trials which are to take place at the end of July. These may be obtained from the honorary secretary, Mr. E. Shrapnell Smith, by addressing him at the Royal Institution, Colquhitt Street, Liverpool.

## A DUTCH MOTOR-CAR.

WE illustrate herewith an example of a well-built motor-car manufactured in Holland. It will be seen that it is designed to seat two persons, an emergency seat being provided for a third.

The motor and mechanism is on an improved form of the Benz system, the radiating chambers and cooling tanks being fitted in the ordinary manner.

The carriage is graceful in design, and we are informed by a Dutch correspondent that it runs very easily and steadily, whilst the carriage-builder's portion of the vehicle is extremely luxurious, and gives every ease and comfort in travelling.

This car is manufactured by the Rijwiefabrik Simplex, of Overtoom, Amsterdam. This firm also make a delivery wagon on similar principles, of which we have a photograph but which does not lend itself to reproduction.

THE Rothwell Machine Co., Ltd., was registered on April 8th by Jordan & Sons, Ltd., 120 Chancery Lane, W.C., with a capital of £10,000 in £1 shares. It is intended to acquire the business of dealers in cycles, knitting and other machines, motors-cars, etc., as now carried on by the Rothwell Machine Co. at Bolton and Leicester, and to develop and extend the same. The directors are Messrs. E., J. and R. Rothwell.

We are glad to record that Mr. H. Carver, of East Quay and High Street, Bridgwater, is prepared to supply automobilists who may visit his district with petrol, of which he keeps a considerable stock. He also possesses a large riding school, in which he is prepared to "stable" the cars of any automobilists free of charge, or, if need compels, to carry out "any little adjustment" that the cars may require. We trust our readers will remember Mr. Carver's generous offer of free stable accommodation when they chance to be in his neighbourhood.

A CONTEMPORARY states that a novel motor race is to be run in Paris. According to this account the participants will be conducted to the second platform of the Eiffel Tower—leaving their motors, we trust, below—and a certain steeple will then be pointed out to them. The pistol will then be fired; the racers will have to rush down to their machines and make for the appointed spot by whichever road they choose. The first to arrive will carry off the prize. We have had no confirmation of this extraordinary report, and are inclined to doubt its correctness. At any rate, it is not among the published fixtures of any of the recognized automobile clubs.

## DESIGNS OF WHEELS, PULLEYS, AND FLYWHEELS.

In a paper on "The Design of Wheels and Pulleys," read before the Civil and Mechanical Engineers' Society on Thursday, the 20th inst., Professor Archibald Sharp, B.Sc., Wh.Sc., A.M.I.C.E., first referred to non-driving wheels, solid and cast in one piece, but differentiated into arms, rim, and nave. Built-up non-driving wheels with compression and tension spokes were then described; the ordinary cart and carriage wheels with wood spokes, having the latter put under an initial compression by the shrinking of the iron tire on the felloe, were next considered. The iron tire in this case also provides the only fastening required to keep the hub, spokes, and rim together. In the bicycle wheel with tension spokes the rim is subjected to a circumferential compression due to the screwing up of the nipples. In both these cases the total initial compression or tension on the spokes is approximately 2 $\pi$  times the total initial tension or compression on the rim. It was pointed out that a narrow rim was more liable to buckle sideways than a wider one, the Westwood hollow rim being an ideal one for resisting buckling. The spread of the spokes was necessary to give a rigid lateral connection between the hub and the rim, but while a wide hub was advantageous in this respect, a greater spread of the spokes made greater demands on the lateral strength of the rim. A mathematical investigation of the distribution of the stresses on the spokes of a bicycle wheel had been made, taking into account the elasticity of the parts. The stress on any particular spoke was given as a fraction, having for its numerator and denominator respectively a determinant of an order equal to half the number of spokes in the wheel. With a forty-spoke wheel the calculations of these determinants are so laborious that the formula is practically worthless as regards numerical results. The mode of transmission of the effort from the rim to the nave in driving wheels and pulleys was next referred to; the essential difference between flexible direct spokes, flexible tangent spokes, and rigid arms being pointed out. The author's own method of building wheels was described, as also its application to bicycle wheels, flywheels, and the gigantic wheel at Earl's Court. The question of wood *v.* steel for wheel and pulley rims was discussed. Iron or steel makes an ideal tie-bar, while it can be mechanically jointed with little or no loss of strength. Carpenters' joints, on the other hand, are usually weaker than the solid parts of the structure. But in many cases, especially where bending is the principal stress to be resisted, wood *per se* is immensely superior to iron or steel. In the case of a wheel or pulley rim the width is fixed by the conditions under which the wheel or pulley runs, and must be the same whether the material be wood or steel. The strength of a beam to resist bending is proportional to its width, to the square of its depth, and to the tensile strength of the material. Comparing two beams of wood and iron of the same width, length, and weight, the wood beam will have ten times the depth of the iron one, and the product "square of the depth by tensile strength" for the wooden beam will be ten times that for the iron beam. If the beams are to be of equal strength, the weight of the iron beam is  $\sqrt{10}$  times that of the wooden one. The Gormully and Jeffery bicycle wheel with wood rim, the "Dodge," "Reeves," and "Gilbert" wood pulleys with segmental rims were shown, while the Niles Tool Works Company's wrought-steel pulley with rim, arms, and nave made entirely from steel stampings received very high praise. The author then described and exhibited the pulley designed by himself with bent-wood rim, with numerous spokes made of round wood screwed to the hub and rim, and arranged to act as tangential spokes half in tension, half in compression. From the fact that the rim is supported at close intervals, it can be made much thinner and lighter than usual; and since the spokes are not subjected to bending stresses of appreciable magnitude they also are lighter than usual. The principles underlying the design of flywheels regarded as stores of kinetic energy were briefly discussed. The energy stored in a moving body being proportional to its weight and the square of its speed, it is natural that engineers should push the speed of large flywheels to the utmost safe limit. The circumferential stress due to centrifugal force on a ring rotating freely is also proportional to the square of its linear speed. But at a linear speed of 100 ft. per second, which is about the safe limit for heavy flywheels of usual construction, this stress is less than half a ton per square inch. A factor of safety of 17 has been claimed for heavy flywheels of the ordinary type, but this must include the factor of ignorance of the bending stresses induced on the rim by the constraint of the arms. These bending stresses are roughly proportional to the square of the unsupported length of rim between two adjacent arms, or inversely proportional to the square of the number of arms or spokes in the wheel. As to methods of diminishing bending stresses on the rims of flywheels, the author referred to a design for radial sliding joints for the arms, so that the rim might be practically in the condition of the freely rotating ring. Solid disc flywheels with the rim practically continuously supported gave a good design in cases where they could be applied; but they were inapplicable for the very large wheels required for large factories. The author's design for flywheels, in which a cast iron rim is united to the nave by a number of steel tangent spokes wrapped in pairs round the nave, was described. It was claimed for this design that the rim being supported at close intervals had bending stresses of comparatively small magnitude, while the initial tension on the spokes due to screwing up the fastening nuts produced an initial circumferential compression on the rim, and that if the total spoke sectional area was sufficient, even at a speed of 100 ft. per second, the circumferential tension in the ring might be zero. A brief reference to the destructive effects of flywheel accidents terminated a very interesting paper.

In the discussion, Mr. Swindley asked if he was right in understanding Professor Sharp to say that the width of the hub had no influence on

the strength of the wheel to resist buckling. If this was the Professor's opinion it was contrary to that of all cyclists. Mr. Hanssen said he thought the British manufactories were, perhaps, too much in the hands of commercial men, and that there was very little engineering ability on their staffs, most of the work being left to poorly-paid draughtsmen. In America it is different—there the heads of the firms are thoroughly well trained. He also spoke of the interest he took in the "Sharp" tangent flywheel. Professor R. H. Smith spoke of the interesting fact which Professor Sharp brought to the notice of the meeting, viz., that for equal weight and solid rectangular section wood was stronger than iron or mild steel for beams supported at the ends. He also admired Sharp's tangent spokes for bicycles. Mr. Bateman referred to the natural tendency of the British mind to look upon a man who brings out something new with suspicion, and said that the sooner we got rid of this insular prejudice the better. In America, for example, a man who had anything new was received with open arms, and this accounted for the number of extremely neat and ingenious devices which are so frequently brought out by our American cousins. He said he looked with great interest to the future of the "Sharp" flywheel: it looked like a triumph of brains over brute force. Mr. Brewster asked for the relative cost of wood pulleys and ordinary iron ones. To this question Professor Sharp replied that the prices were practically the same, the steel ones being slightly higher. Mr. Ackermann also referred to the American and German competition and the British prejudice against a thoroughly scientific education, and gave as an instance that in some of the largest manufactories in Germany there were as many as one hundred Doctors of Science on the staff, whereas in Great Britain it was more usual for there to be one Doctor of Science to one hundred manufactories.

Professor Sharp, in his reply, said he did not intend to convey the meaning taken by Mr. Swindley, and that if he had unwittingly used language which might be capable of that interpretation he could only offer his apologies. On this subject at least his opinions were quite orthodox and in agreement with those of the majority of cyclists. He then referred to the experiments on repetition of stress by Wöhler and Bauschinger, and pointed out that in a flywheel where the rim is repeatedly being accelerated and retarded by the arms the frequent reversal of stress on the arms may have an appreciable effect in diminishing the true, as distinguished from the apparent, factor of safety.

#### A REMINISCENCE OF THE ROYAL AGRICULTURAL SOCIETY'S TRIALS.

ON Tuesday and Wednesday of the present week Mr. Justice Lawrance and a common jury were occupied in hearing the action brought by Messrs. Roots & Venables, of Westminster Bridge Road, against the Daimler Motor Co., Ltd., of London and Coventry, with a view to recover damages for injury alleged to be sustained owing to a collision with one of the plaintiffs' vehicles during the carrying out of trial tests promoted by the Royal Agricultural Society of England, owing to the negligence of the driver of a vehicle owned by the defendant company. The defendants denied negligence, and pleaded that the plaintiffs had themselves been guilty of negligence.

Mr. Thomas Terrell, Q.C., and Mr. Montague Shearman appeared for the plaintiffs; Mr. Atherley-Jones, Q.C., and Mr. F. M. Abrahams for the defendants.

It appeared that the plaintiffs were manufacturers of motor-cars and motor-wagonettes, and the defendants were manufacturers of similar vehicles. In June last the Royal Agricultural Society of England organized a show and a series of tests of motor-cars to take place near Birmingham, and the plaintiffs were going to exhibit and compete with a motor-van which they had manufactured for Peek, Frean and Co. The defendants were also going to exhibit some of their motor-cars. A competition was arranged, and was to be decided by a trial along the public road on June 13th. The motor-van which the plaintiffs had manufactured for Peek, Frean & Co., was to run in this trial, and a motor-van of the defendants was to do so also. The defendants had another vehicle, a motor-wagonette, which was not in the competition but was being driven along the road at the time. The defendants' competing van was started and then the plaintiffs' van five minutes later. The latter was proceeding along the road from the direction of Bassett's Pole, when, after they had gone two miles, some member of the party shouted that the defendants' wagonette was overtaking them. Shortly afterwards the wagonette, which was said to be a faster vehicle, came up, and according to the plaintiffs' case ran alongside for 80 or 90 yards "bustling" the plaintiffs' van and forcing it to run on the grass. The driver of the wagonette then tried to pass the van and a collision occurred, the van being thrown into the ditch and its occupants into the hedge. The van was damaged, and it was exhibited at the show as a damaged vehicle. The plaintiffs' van was so badly damaged that it had to be removed on a trolley, and the plaintiffs now sought to recover the cost of repairs and the expenses thrown away in sending to the show a car which, through the negligence of the defendants, they were unable to exhibit properly, and the plaintiffs were debarred from taking part in the trials of these vehicles, thus suffering inconvenience and probable loss. Each party alleged that the accident was caused by negligent driving on the part of the other side. The defendants said that they did not "bustle" the plaintiffs' vehicle, and that they were only alongside for a few seconds. They also alleged that the damages claimed were excessive.

In summing up to the jury, the learned Judge said that he was sorry to

see imported into motor-car cases the same spirit of contradiction that was to be found in all running-down cases. Now they had motor-cars added to the list. It was said on one side that a horn had been blown, but this was absolutely immaterial, and was only introduced in order that it might be contradicted. If any of the jury had ever ridden in a motor-car or an electric cab they would know that it would take a good big horn to be heard. However, the matter was only introduced just as the Irishman trailed the tail of his coat to make people tread on it. He would defy the jury to reconcile all the evidence, and they would have to make up their minds boldly one way or the other. His Lordship then reviewed the evidence, and the jury, after consideration, found a verdict for the plaintiffs for £50.

Judgment was pronounced accordingly.

#### MORE PROSECUTIONS.

GEORGE SKINNER, of 15 Woodville Road, Ealing, was summoned at the Brentford Petty Sessions for having driven a motor-car to the common danger at the Mall, Ealing. Charles Friswell, of 34 Madeley Road, Ealing, and Holborn Viaduct, E.C., was summoned for driving a motor-car furiously. The solicitor who defended elicited the fact that the summonses were both taken out under the Police Act, and the Clerk explained that they were not identical, as it was possible to drive to the common danger without driving furiously. P.C. 506 X said on the evening of the 30th ult. he was at the Feathers Bridge, Ealing, when he saw Mr. Friswell driving a motor-car accompanied by a lady over the bridge and round the Mall at the rate of twelve or thirteen miles an hour. About fifty yards in front was a two-horse van in the middle of the road, and the motor-car passed on the wrong side, causing the horses to shy and bolt. About the same time Mr. Skinner, driving another motor-car, came up at a much slower pace. He also attempted to pass the van on the near side, and the horses of the latter became unmanageable and dashed across the road, with the result that the van collided with a lamp and the driver was thrown on his head and rendered unconscious. Witness took the man into the Feathers public-house and sent for a doctor. Mr. Friswell did not stop, but Mr. Skinner did. Mr. Friswell came back afterwards to look for his friend, and witness told him of the accident. He said he was not to blame, and gave his name and address. To the Bench: There was plenty of room for the motor-cars to pass the van on the off side. Cross-examined: When the first motor-car turned the corner the van was fifty yards ahead, and there was plenty of room for any vehicle to pass it on the proper side. The driver of the van was not drunk. Henry Lacy, the driver of the van, said that the first motor-car passed on the off side, and the other one tried to pass on the near side. He did not succeed, but swung round and passed on the off side. This frightened the horses, with the result stated by the last witness. For the defence it was urged that the drivers of the motor-cars were not to blame, and that but for the accident to the carman nothing would have been heard of it. The Bench considered the case proved, and fined Mr. Friswell 20s. and costs and Mr. Skinner 5s. and costs.

#### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### Motor-Cars in Poland.

MANY attempts have been made to introduce motor-cars into Poland and Lithuania, but they have not been conspicuously successful owing to the bad roads in those parts and also to the unsuitability of the vehicles imported. The endeavour to establish a regular motor-car passenger service from Piotrkoff to Kalisz—a distance of eighty miles—has been suspended in consequence of the German-made cars proving too heavy and having insufficient power for Polish roads. But the British Consul, to whose report we are indebted for this information, believes that the promoters of the enterprise intend to form a new company and order fresh motor-cars from Paris. It is also proposed to commence running a similar service from Wroclawsk to Lipno, in the government of Warsaw, a distance of twenty-four miles. In the neighbourhood of Warsaw several market gardeners are using motor-cars from Dessau in Germany for conveying their own and their neighbours' produce to the market. Our Consul, however, does not write hopefully of their ultimate success, as there is an excellent service of light railways along every high road into the town of Warsaw. Several people have lately bought motor-cars for their own pleasure, and last year one French firm sold nine in Poland; but the only public motor-car in the country that is proving a profitable venture is one owned by the proprietors of a sugar factory in Lublin, which conveys passengers to and from the railway station. Evidently, with suitable cars and with improved roads, the prosperous regions of Poland and Lithuania will deserve considerable attention from makers of serviceable motor-cars for passengers and produce in the near future.

### Motor-Vehicle Services.

ADDITIONAL headway continues to be made in the provision of motor-vehicle services in country districts. Leicester is now provided with a small service, and amongst other places Canterbury has inaugurated its promised service to Herne Bay and back. At present the Herne Bay and Canterbury service is carried out by one car only, but we understand that additional cars will shortly be placed on the road to meet the exigencies of the summer traffic. This enterprise is due to the initiation of Messrs. Livet and Underwood, electrical engineers in Canterbury, and as this road has been served very badly in the past by a two-horsed omnibus, there is every promise of its proving successful, more especially as the horse-drawn vehicle charges the fare of 2s. 6d. for the journey between the two towns. We understand that the motor-car leaves Canterbury each day at 10 a.m. and 3 p.m., returning from Herne Bay at noon and 5 p.m. In connection with these motor-vehicle services, Mr. S. F. Edge writes a letter which we publish in another column drawing attention to the small amount of care displayed in providing for the efficient up-keep of vehicles thus employed. We quite agree with our correspondent in this matter, and have previously emphasized the necessity of

providing efficiently-equipped repair-shops in order that the cars may be kept up to their potential capacity in ordinary service.

### Ready for a Challenge.

MR. GEORGE DRESDEN, the Liverpool agent for the Butler motor-tricycle, is so thoroughly imbued with the capabilities of the machines vended by him that he offers to put his vehicle in competition with that of any other maker both for hill-climbing and speed. He states that he can guarantee these tricycles will travel at speeds up to thirty-seven miles per hour, and in hill-climbing they can beat any competitor. As will doubtless be remembered, these vehicles are fitted with a motor said to develop  $2\frac{1}{4}$  h.p., and Mr. Dresden is so convinced of the good character of the vehicle that, in a letter to us, he offers to lend a machine to anyone. Surely some of the De Dion tricycle riders will be glad enough to accommodate Mr. Dresden with a match.

### Licences for Public Motor-Vehicles.

WE commented in our last issue upon the unfair restrictions laid down by local authorities in regard to the travelling of public motor-vehicles through the streets of the towns under their care. It will be remembered that at Eastbourne a restricted speed of five miles was laid down for these vehicles, whilst horse-drawn vehicles were permitted to proceed at any pace to which it may be possible for the drivers to urge their horses. Mr. Frank Morriss, of King's Lynn, points out, however, that residents of this town are in an even worse position, for warning has been given by the authorities that a speed of four miles per hour must not be exceeded in passing through the town. The question of licensing again presents many unfair features. We have recorded the Lancaster and Morecambe affair, and now another similar case has occurred at Clacton. The Clacton authorities refuse to grant licences to public motor-vehicle services. There was a chance of their reconsidering their decision, but the proprietors of horse-drawn brakes, which would be put under competition with the proposed motor-vehicle services, drew up a petition which has practically destroyed, for the present at least, all chance of the Council granting licences. It is extremely hard that interested parties should have the power to so prevent the inauguration of public motor-vehicle services in districts where it has been proved even under difficult conditions that they are both popular with the public and financially and commercially successful.

### The Mors-Pennington Challenges.

WE publish in this week's issue another of the series of letters on the now complicated Pennington-Mors challenges. Apparently these challenges are equally as unlikely to materialise, as has been the case on many previous occasions. We can, however, see nothing in the letters last published which should prevent some

speedy termination of the last challenge accepted by the Automobile Association. In regard to vehicles accompanying the contestants over the course, we are quite at one with Messrs. Pennington & Baines in the desire that no vehicle other than those competing should be allowed on the course, in order that all chance of impeding the contestants may be avoided. We think the better way for Messrs. Pennington & Baines and the Automobile Association to proceed would be for them each to nominate two persons who should formulate the conditions under which the contest is to be carried out and make all arrangements for its being held under the conditions of the challenge laid down by the one party and accepted by the other. Letters appearing first from one party and then from the other in our columns at intervals of a week will not do much to advance matters, but if the four persons nominated by the two parties to the contests could meet we are quite certain that the whole business would be settled in a few hours in a manner satisfactory to all. The challenge has undoubtedly created a considerable amount of interest, and we should like to see it brought off. We will gladly receive the nominations of Messrs. Pennington & Baines and the Automobile Association, and on receipt of the names will put matters in form for a meeting at an early date to draw up the conditions for the submission and approval of both parties.

#### Motor-Tricycle Seats.

IN reference to the demand for a seat other than a saddle for use on motor-tricycles, the Automobile Association, Ltd., point out that they brought out quite a number of months ago a special saddle-seat for motor-cycles, as illustrated herewith. The seat is very comfortable, and there is a backrest to which pockets are fitted, affording ample room

for tools, etc. They are generally supplied together with a pair of footrests which are fitted on the fork, and where the feet, when not required on the pedals, may very conveniently be placed. The whole has been considered a great improvement, and we are informed that they have been used by owners of motor-cycles to their entire satisfaction.

#### A Motor-Car Pioneer in the Eastern Counties.

A CONCERN which is doing good work in advancing the motor-car movement in the eastern counties is that conducted by Mr. Frank Morriss, of London Road, King's Lynn. This gentleman claims to have been the pioneer of motor-vehicles in that part of the country, and is catering for the demand on a large scale, he having secured the district agency for the vehicles of the Motor Manufacturing Co., Ltd., London and Coventry, Beeston motor-tricycles, and the popular Benz cars, while, we understand, he is now taking up the sale of Pennington cars. Mr. Morriss has had to face a good deal of opposition, for in a letter to hand this week he informs us that he has been "warned by

the authorities in this town against exceeding a pace of four miles per hour." Mr. Morriss adds that automobilists in

Eastbourne, for example, have still room to exclaim "Thank heaven, we are not as others!"

SIR DAVID SALOMONS has presented the organizing committee of the Spa automobile meeting, to be held under the auspices of the Belgian Automobile Club, with the sum of £20, to be given as a prize for motor-tricycles.

AT the Wareham Police Court on the 21st ult. Allen Hickman, of Northampton, was fined £1 and 24s. costs for furiously driving a motor-cycle on April 1st. The evidence was to the effect that the defendant was travelling at the rate of eighteen to twenty miles an hour. His defence was that he had ridden thousands of miles without an accident, and that he was only going at ten to eleven miles per hour.

THE Leicester Motor-Car Co., Limited, was registered on April 20th, with a capital of £5,000 in £1 shares, to purchase, sell, let on hire, and otherwise deal with automotor cars, and to carry on the business of cycle and cycle part manufacturers and dealers, motor-car and carriage builders, mechanical engineers, machinists, millwrights, coopers, founders, wire drawers, tube makers, metallurgists, saddlers, enamellers, etc.

A FRENCH motorist, Dr. Callet, gives in a French contemporary statistics of all the expenses connected with keeping a motor-car going for 4,000 miles. The weight of the car was 14 cwt.; it had one cylinder, and worked at 4 h.p. He spent nearly 500 francs for benzine and oil, 250 francs for sabling, 1,000 francs for a driver; he counts nearly 800 francs for wear and tear, and over 1,500 francs for repairs, of which 512 were spent for the car, 92 for the machinery, and 137 for the tires. The costs per mile according to this statistic come to nearly 11d.; but it seems to us that Dr. Callet must have been singularly unfortunate as far as accidents are concerned, his repair account being enormously high.

FROM 1st inst. all bicycles and motor-vehicles in circulation on French territory must be provided with the new official plate showing that the owners of the machines have paid the annual tax. The penalty for non-compliance with the regulation will be a summons and a fine. During the last few days, accordingly, cyclists and motor-car men have flocked first to the Mairie to "declare" their machines, and secondly to the tax-collector's abode to pay their money and get their plates. The impost, of course, has always been obligatory, but fully half the total number of owners of bicycles and motor-cars in France had never paid it until the new law enforcing the "plaque de contrôle" came into force.

# A New Heavy American Electric Motor-Vehicle.

THE PATTON AUTOMOBILE WAGON.

WE illustrate in Figs. 1 and 2 side and front views of a new heavy automobile lorry or van of American origin. These views are interesting for several reasons: in the first place they demonstrate the ideas of American inventors in regard to vehicles of this type, and in the next give English constructors a glimpse of the latest American practice. The car and its motor equipment will also present considerable novelty to British manufacturers, more especially to those who are studying the problem of the moving of heavy loads in automobile vehicles over ordinary roads.

The car is the invention and is built to the designs of Mr. W. H. Patton, of the Patton Motor-Vehicle Company, Chicago, the constructors being the well-known company of electrical engineers, the Fischer Equipment Company, of Chicago and a dozen other addresses, who are also the manufacturers of the Wood's electric motor-vehicle and several other types of "electromobiles," as some of our contemporaries term them. Mr. Patton, the designer, appears to be working on similar lines to Heilmann, for, like the French inventor, he believes in electricity as the actual motive power, but holds that the current shall be generated on the car itself. In fact, Mr. Patton is the Heilmann of America, and has for several years past been employed in

exploiting his system on the railways in the States. He has lately turned his attention to road vehicles, and the car illustrated is one result. Mr. Patton is firmly convinced that each transportation unit, to gain true efficiency, should utilise a combination of gas or petroleum-spirit engine, electric generator, storage battery, and electric motor. To most minds this not only seems a cumbersome method of generating and transmitting power, but to many the losses incontestably incurred in the various conversions from energy to current, from current to battery, from battery to motor, and from motor to road wheels would appear to prohibit any such utilization of an apparently unnecessarily heavy series of "convertors."

Mr. Patton, however, holds that he unites the economy of the impulse engine with a constantly steady average load with the undeniable flexibility of electricity, and further that he secures a satisfactory efficiency, combined with all the advantages of self-contained units. Mr. Patton argues that "the gas engine of itself has not the necessary flexibility of power, and would not work under such conditions with any degree of economy, for it is a well-known fact that these engines must work at about normal load to give good results, and that any great overload is refused by their stopping; and it is also a well-known fact that in overcoming train

inertia nearly twice the power is demanded over that required to maintain ordinary momentum, as it is also a well-known fact that on varying road and load conditions the power demanded of the engine often runs far below its normal capacity. Knowing these facts by actual experience with gas engines, the Patton electric-motor system was designed with the purpose of balancing up the load for the engine so that it might have a constant load factor at all times and under all conditions, and also to reinforce such engine with the necessary flexibility of power."

It will be seen that the vehicle is of very heavy construction, as is indeed necessary in view of its own weight and the load to be carried. The vehicle with its equipment, but without its load, weighs rather more than  $3\frac{1}{2}$  tons, its designed load being 3 tons, which, it is stated, it can handle without difficulty. The wheel gauge is  $5\frac{1}{2}$  ft., and the overall length of the vehicle is 12 ft. Ball-bearings are furnished to all road wheels, and steel tires  $4\frac{1}{2}$  ins. wide are at present

THE PATTON MOTOR-WAGON—END VIEW.

used, although experiments are being conducted with a view to the employment of solid rubber tires. The exceptional strength of the vehicle frame, springs, and all parts of the wagon are fully demonstrated in the illustrations; indeed, the springs on the fore carriage appear to be of the strength customarily found on heavy locomotives.

The prime mover is a three-cylinder vertical petroleum-spirit engine, made by the American Petroleum Motor Company, and this is direct-coupled to an eight-kilowatt, 125 volt, six-pole Crocker-Wheeler dynamo. A view can be obtained of these in Fig. 2, whereby it is seen that this set of generators is placed longitudinally in the vehicle, partly above and partly below the floor of the wagon body, directly below the driver's seat. The driving shaft is carried through the engine, the fly-wheel being placed at one end, and the dynamo at the other; the speed of this set is 500 revolutions per minute. The explosive gases are, of course, fired by electricity, current being taken from the storage batteries,

presently described, to the necessary induction coils. The cooling water for the cylinder walls of the engine is carried in a tank placed in front of the battery tray, and is clearly shown in the middle of the wagon body in Fig. 1. A pump, electrically driven, is employed to circulate this water, which after leaving the cylinder walls is conveyed through the many feet of small copper pipes shown on the top side boards in Fig. 1 and on the face of the foot-board in Fig. 2, thus being effectively cooled in this lengthy passage through these coils open to the air currents generated in the vehicle's moving. The storage for the petroleum spirit is placed under the driving seat; its capacity is fifteen gallons.

The storage batteries are carried in the tray shown in Fig. 1 in the centre, and occupying the full width, of the vehicle body. They are made up of 55 cells of the Willard type, each having a capacity of 120 ampère hours.

Two four-pole electric motors are employed, the rated horse-power of each being  $7\frac{1}{2}$ . These are suspended partly on the rear axle and partly from the wagon body, one motor being connected through double-reduction gearing to each of the rear road wheels.

The controller or commutator switch is of the iron-clad type, and is placed in front of the driving seat, as shown in both illustrations. Three speeds are provided, viz., three, six, and eight miles per hour. A reversing switch is provided on the driving seat. The switch or controller, the dynamo, and the batteries are connected in multiple, the dynamo and engine thus being driven at a nearly constant load, the current generated being split up between the motors and the batteries in accordance with the variation of the demand. When the demand is light the surplus current is taken to the batteries, and when the demand for power is heavy the battery supplements the capacity of the dynamo.

The steering gear, which is plainly seen in Fig. 2, consists of hand wheel mounted on a shaft, a pinion engaging in a rack attached by steering links to the hubs of the front wheels. Two hand brakes are provided, one being placed on each motor-shaft; these, together with the electric brake, are amply sufficient to control the vehicle. The band brakes are worked by foot pedals on the foot board.

The arrangement for starting the petroleum spirit engine is novel and ingenious. The necessary switches, etc., are contained in a box placed under the driving seat at one side. When it is desired to start the engine the switches are operated, with the result that the direct-coupled dynamo then acts as a motor, taking current from the storage batteries, running up the engine until its designed speed is attained, and it runs by its own power. The switch is then pulled over and the conditions reversed, the engine then actuating the dynamo and causing it to become a generator once more.

Although the vehicle has had some considerable service, our American correspondent has been unable to obtain any positive data as to its cost of working, current consumed, etc. No accurate data has been tabulated owing to the varying conditions of road surfaces, pavings, gradients, and loads carried. Certain tests have been carefully made, but the results of these are not yet procurable for publication. It is said, however, that the consumption of spirit per hour is about  $1\frac{1}{4}$  gallons, but this is hardly valuable without additional particulars.

THE Sunderland Motor-Car Co., Ltd., has just been registered with a capital of £10,000 in £10 shares (400 founders'), to acquire and take over as a going concern the business now carried on by Leonard Hodgson at 71 Suffolk Street, Sunderland, and to carry on the business of motor-car proprietors, carriage, cab, omnibus, and wagon proprietors, cycle makers and dealers, engineers, iron and brass founders, wire-drawers, tube makers, fitters, rubber merchants, tire manufacturers, etc. This is the Company that is running the motor-car service in Sunderland at the present time and that intends extending its operations to other districts in the neighbourhood.

## A New Petroleum-Spirit Motor-Vehicle.

FIG. 1.—THE CROWDEN MOTOR-CAR—SIDE VIEW.

WE illustrate in Figs. 1 and 2 a new petroleum-spirit vehicle recently constructed by Mr. C. T. Crowden, of the Motor Works, Leamington. Details of some parts of the construction are given in Figs. 3, 4 and 5.

It will be seen that the body of the vehicle is of the four-wheeled dog-cart type, having seating accommodation for six persons when carrying a full load, four persons facing the direction of progression and two facing towards the rear. The whole of the controlling and steering apparatus is placed on the right hand of the driver's seat. The motor is of 10 h.p. effective, and is of the twin-cylinder horizontal type. The cylinders are not provided with water-cooling chambers, but the whole of their length is inserted through a large wrought copper tank in such a way that the cylinders are closely in contact with the metal of the tank and consequently completely surrounded by an envelope of water of considerable depth. By this means Mr. Crowden claims to have overcome the difficulties which are so frequently found in regard to the admission of the cooling water to the cylinder chambers by means of an imperfect joint at the cylinder head. The motor is carried at the rear of the vehicle, well off the ground, and above the main frame. The fly-wheel is central with the centre of the car and rotates in the same direction as the vehicle travels—it is claimed that this ensures greater steadiness in running and also contributes to the ease with which the vehicle is steered. The engine is so constructed that, at the desire of the driver, either cylinder can be shut out of action, it being claimed that one cylinder furnishes sufficient power to

propel the vehicle over fair roads at ordinary speeds. Power is transmitted by belts and chain-gear through a differential

FIG. 2.—THREE-QUARTER VIEW OF CROWDEN CAR.

gear shaft to the road wheels. Foreign patents are pending in regard to some of these details, and this precludes us at present from giving further particulars of this mechanism and

some other parts, but we hope to do so shortly. It is claimed that the methods adopted give absolute command of speed without shock or jar and at the same time permit of several variations between the designed speeds. The valves and valve boxes are of very peculiar and ingenious construction,

FIG. 3.—SECTIONAL ELEVATION OF CROWDEN WHEEL AND HUB.

the whole of the valve gear being removable and falling into the hand on the loosening of a few nuts, it being possible to change any part, or the whole, within the space of a very few minutes. Electric ignition is employed, current being supplied to the coil from secondary batteries.

The wheels of the car are of peculiar construction—details are given in Fig. 3. They are of the gun-carriage type, the spokes being double dished, as shown, thus providing a wheel which runs as nearly as possible perfectly upright. Increased stability is ensured by the fact that in wheels of this type double the width of stock is obtained. The chain wheels, or sprockets, instead of being bolted to the spokes of the road wheel as is generally the case, are bolted to a flange provided on the wheel hub. By this means it is assured that the hub and chain will always run true with the axle, which is not the case when the sprockets are bolted to the spokes, as it is well known that wood wheels do not run accurately and true owing to the twisting in the spokes and the differences caused by variations of weather. In the case where the chain sprockets are fastened to the hubs in this manner it is also possible to employ a gear case, whereas this is impossible when the sprockets are bolted to the spokes. The axle boxes are made similarly to the long bolted mail-coach pattern, with a plate at the back of the collar, so that it is impossible for the wheels to come away from the axles unless they are absolutely broken up.

FIG. 4.—PLAN OF STEERING DEVICE.

In the steering mechanism, too, Mr. Crowden has effected improvements. It is the usual custom to actuate the links through a fork, eye and pin, an arrangement which results in very rapid wear on the pins and in the holes, with the result that accidents are liable to happen through the breaking of the worn pins; in wet weather also the lubricant is frequently washed away, and is replaced by gritty mud, causing stiffness in steering. Mr. Crowden's new joint substitutes for this arrangement a weather-proof linkage, of which the lever is provided with a small taper pin. If the motion of the lever is at right-angles, a block is made to correspond, and this is fitted with leather washers and caps in the same way as an ordinary road-wheel axle. This ensures the retention of the lubricant, and prevents it being washed away. Fig. 4 gives a general plan of this steering device, and Fig. 5 illustrates in detail the joint itself. This appears to be an excellent device.

Mr. Crowden by no means restricts himself to the production of petroleum-spirit motor-vehicles, as he has a steam vehicle now on the point of completion, besides several carriages to be fitted with electrical motor and storage

batteries. In fact, Mr. Crowden is evidently making his works a new centre of the industry, having fitted them with

## A SATURDAY'S OUTING.

IT has been remarked that variety is the spice of life, and that if life was all sunshine there would cease to be any pleasure at the presence of King Sol. The Automobile Club as a rule are, or rather have been, fortunate as regards weather in all their outings, and that they were not so fortunate on Saturday—well, those who took part in the run might congratulate themselves the weather was not worse. At all events, the company experienced variety. When the cars failed pedestrianism was resorted to, and, as an alternative, afterwards the locomotive. Five miles of "pad-the-hoof," although the participants were languishing for their mid-day meal, seemed to be thoroughly appreciated, while the three miles walk over fields and down dingles after tea by a party of half a dozen caused the journey home in the carriages of a railway train to be enjoyed. The elements all day were unpropitious, and when the driving rain was not beating in the faces of the party the wind was blowing a furious gale. The roads also were of course extremely heavy, and in some places very greasy.

The following took part in the tour: Right Hon. the Lord Justice Clerk of Scotland, Mr. A. C. Poole, Mr. C. Johnson and Mr. Frentzel in a Mors car; Mr. and Mrs.

FIG. 5.—DETAILS OF STEERING COUPLE JOINT.

the newest and best machinery, and is prepared to manufacture any type of vehicle which custom or fancy may demand.

We are glad to record that a branch of the Motor-Car Club has been formed in Birmingham. Mr. J. W. Stocks has undertaken the duties of hon. secretary and treasurer, and "application for membership" forms can be obtained from him by sending a post card to "Rottingdean," Alcester Road, Moseley, Birmingham. This extension of the Motor-Car Club's operations to the provinces demonstrates the fact that the parent Club, freed from all restraining influences and connections, is running on the right lines to make headway.

SOME OF THE PARTY AT ST. MARY'S, GODALMING.  
From a Photograph kindly sent by R. W. BUTTEMER, ESQ., B.A.

Hodges, Miss Williams, Mr. W. H. Cox (of Dunkeld), Mr. W. H. Taylor (of Mortimer), Mr. J. Taylor, F.R.G.S., and Mr. Julian (of Teignmouth), London Motor-Van and Wagon Co.'s *char-a-bancs*; Mr. Roger Fuller and Mr. Charles Cordingley, Daimler; Mr. Hewetson and Mrs. Bazalgette, Benz; Mr. and Miss Butler, Benz; Mr. Knight (of Farnham), Benz; Mr. Buttemer (of St. Mary's, Godalming), Benz; a Daimler with a party of four on board; Mr. Edge, on a Phœbus; Mr. Capel and Mr. Phillips, on De Dions. The route sheets drawn up by Mr. Johnson were admirable so far as they went. After leaving Col. Davies' house the instructions were "Then on to Frensham Pond Hotel," and most of us succeeding in reaching there, *via* Farnham, and after travelling the narrowest of country lanes. Several traction-engines were passed, one having two trucks behind, and to pass these required the most skilful care on our part, in one instance the car and traction-engine having to be stopped, so narrow was the way. It was only by very skilful manœuvring and a certain element of risk of slipping into a ditch that the cars could pass. Being Saturday afternoon there were numbers of teams of two and three horses returning from labour in the fields, so that travelling was not of the speediest. The hotel was reached just before 3 o'clock.

After luncheon Mr. Fuller continued his journey to Brighton *via* Hog's Back, Midhurst, Chichester, etc., intending to reach his destination that evening. Barring punctures, this should have been accomplished, as the motor was in splendid

condition, running silently and giving no trouble at any part of the journey. We may mention that Mr. Fuller has pneumatic tires on his front wheels and solids at the rear. A bad puncture of the former delayed the car on its outward journey for a long time. Mr. S. F. Edge played the part of good Samaritan, assisting to remedy matters in the pouring rain. This delay prevented some of the party from accepting the hospitality of Colonel John Davies, A.D.C., at Whitmead. The invitation, however, was freely taken advantage of by others, and much appreciated.

The return journey was commenced about 5 o'clock, and after a short but pleasant stoppage at Mr. Buttemer's picturesque residence for tea, London was duly reached.

## CORRESPONDENCE.

### RESTRICTIONS OF LANGUAGE: "MOTOR WORDS."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am pleased you have set your face against such words as "moto-car," "moto-vehicle," etc., words which will never be heard outside your contemporary's office. "Motor" and "motor-car" have come to stay, and it seems that "car" will be gradually dropped, and that "motor" will be used to imply the whole thing. Dozens of people have enquired: "How are you getting on with the motor?" or "I saw you on the motor yesterday." Again, it seems that the word "motor" would have it thus: "Shall you motor or train it?"; "I shall take the motor." Again, "I motored to Brighton last week."

"Stabling" or "docking" the motor will not go down in this country. My opinion is, it will resolve itself into the use of the word "house," thus: "Where did you house the motor?" "After the motor was housed I went," etc. "House" and "housed" are frequently heard in the above sense at the present day, and they imply exactly what is intended, viz., that the article has been lodged in its house.

Yours faithfully,

April 29th, 1899.

ROBERT CROSS.

### THE CARE OF PUBLIC MOTOR-VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Lately, several people have mentioned to me how the motor industry is being boomed owing to the way local 'bus and *chars-a-bancs* services are now being inaugurated.

Now there is no doubt that no method of popularizing automobilism could be better, but there is one thing that seems to me to be wanting, and that is the certainty of the cars themselves being treated properly.

I have had the opportunity of inspecting some cars which have been in use on one of these services for only a very short time, and a more decrepit collection of things called motor-cars I never saw; and all of it was owing to their bad treatment; not that there was really very much the matter with them, but they looked bad, and they "rattled" when in motion.

One method of treating them that seemed to me entirely wrong was that when they were brought in at night, never mind how dirty they were, they were left in their filthy condition until the next morning, and only cleaned just before going out, the result being that after they were washed there was no time for them to dry properly, and directly they got out, if the roads were dusty, the dust stuck to them, and if they were not dusty, the cars dried in a very dirty looking way.

The steering handles, steering gear, and wheels themselves had a tremendous amount of "shake," so that there was considerable rattle and knock, and generally the cars themselves would do the industry much harm instead of good. I am afraid that many of the companies who are starting so gaily just at the moment will, unless great attention is

given to having proper men to look after the cars and driving, suffer very badly in this direction, and will, besides, do harm to automobilism generally.

The private user, however, is just the opposite as a rule. Everything about his car is well kept and well looked after, and he tries to get the best work possible out of it, with the result that people seeing private cars are fairly well impressed, but seeing public conveyances are rather inclined to be prejudiced against such dirty, rattling vehicles.

London,  
April 27th, 1899.

Yours truly,  
S. F. EDGE.

### EFFECTS OF "JARRING" ON RIDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Tuke's letter on the effects of "jarring" upon riders is very opportune, as the use of motor-tricycles is so greatly on the increase in England at the present time. It is a complete mystery to me why the most uncomfortable cycle saddle, with its very slight springiness, should be retained on motor-tricycles. With machines in which it is necessary to use muscular force to gain propulsion, it is quite true that the saddle type of seat becomes inevitable, but when muscular force is used only intermittently, as in the case of a motor-tricycle, it appears ridiculous to retain the uncomfortable saddle. More comfort is certainly required than is obtainable from the saddle seat, and, if I may so describe it, the seating accommodation should be more "restful" and afford greater support to the human frame. In the early day of the tricycle, a seat placed on double fore springs was used; why cannot something similar be used with the motor-tricycle? By drawing the attention of manufacturers to this requirement of users of motor-tricycles you will do a great service.

Leicester,  
April 29th, 1899.

Yours faithfully,  
G. H. M. ROLLASON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—About twelve months ago I was laid up for ten weeks from the effects of jarring the nerves of the spine by cycling on an unyielding saddle over the very bumpy roads of North Wales. I have since procured the most springy saddle to be found, and on this can cover moderate distances without bad effects on the same roads. Possibly Mr. Tuke's difficulty may be similarly removed; but, if this should not prove to be the case, let me most strongly advise him to dispose of his tricycle and procure a car that is capable of being properly and efficiently suspended on easy springs.

It is not wise to take liberties with the nerves of the spine.

Beaumaris, Anglesey,  
April 30th, 1899.

Yours, etc.,  
"PETROL."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read in your last issue an enquiry for a remedy to prevent "jarring" to the spine when riding over lumpy roads, I have much pleasure in giving my experience after riding over 3,500 miles on a motor-tricycle with tube ignition.

During the past twelve months I have had considerable experience with various saddles, having been several long tours over all sorts and conditions of roads, and have found an anatomical pneumatic saddle to suit me the best.

Sheffield,  
May 1st, 1899.

Yours truly,  
ARTHUR J. BLYDE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Tuke's letter in your last issue in regard to the effect of "jarring" on riders when using motor-tricycles, I have found from experience that the effect at first is felt very much the next day, inasmuch as it makes one feel extremely tired all over, but that after a little use, evidently,

muscles form which in a sense minimise this jar, so that no ill-effects are noticed.

I myself frequently now take runs of well over a hundred miles and feel no effect whatsoever, whereas I well remember at first fifty miles made me feel extremely tired.

One thing, however, that helps me very much is that I have 2½-in. tires with very thin sides, and I use them fairly soft, the result being that that dead concussion that one gets when using, comparatively speaking, small tyres is almost entirely done away with.

I think, however, nothing but use will really get over the difficulty Mr. Tuke complains of.

Hart Street, W.C.,  
May 3rd, 1899.

Yours truly,  
S. F. EDGE.

#### A DUTCH MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very pleased to see that in your issue of the 28th inst. you give some attention to motor building in Holland, and have read with some interest on page 127 "A Dutch Motor-Car."

The "Rijwielafabrik Simplex" is well known in Holland for its cycles, but motors and motor-cars are not yet built by this Company.

You write, "The motor and mechanism is on an improved form of the Benz system," and this must give to your readers the idea that all parts of this motor have been built in Holland. The fact is that the motor is a "real Benz motor made in Germany," and that not a single piece of it has been improved or built by the Simplex Company.

Some weeks ago at the Cycle and Motor-Car Exhibition in Amsterdam the Simplex showed a sort of motor-car body, which would probably be in future a delivery van, but it was not finished. The motor to be used in this car will also be a real Benz, "one made in Germany" and not at the Simplex works in Holland.

The Simplex Co. have not, up till now, built a motor, and about that question there was considerable trouble during the said Exhibition between the chief engineer of the Simplex Cycle Works and a first-class cycle and motor repairing firm at Amsterdam. The engineer told everyone that the motor was built at the Simplex works, which he had to contradict some days later on in the *Kampioen*. The Simplex Cycle Works will perhaps have a good future in motor-car building, but then it will be necessary that a better motor than the Benz shall be chosen and used.

To buy motors in Germany and to introduce same as of native make (in Holland there are no patent rights) is not quite fair, and not at all *recht door zee*.

Amsterdam,  
April 29th, 1899.

Yours faithfully,  
W. SCHUTTE.

#### THE N.C.U. AND MOTOR-CAR CONTROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As having a bearing on the recent correspondence between the National Cyclists' Union and Mr. S. F. Edge, also Mr. C. G. Wridgway, my experience with this body may be interesting. In 1897 I competed against Mr. H. O. Duncan in a motor race, in which the machine ridden by Mr. Duncan was not fitted with pedals for the purpose of physically propelling it in addition to the motor. Mr. Duncan was at one time a professional cyclist, but gave up racing ten years ago, and has since lived in Paris. After this race I applied to the National Cyclists' Union for an amateur licence to enable me to compete in cycle races, but they informed me that I had professionalised myself through competing with a professional in a motor race, and that I should have to apply for a reinstatement. I may say that I did apply, and was reinstated some nine months after. At this time there was nothing whatever in the rules of the N.C.U. concerning

motors or anything pertaining to them, and the Union have only recently passed a rule in which they claim their jurisdiction over motor cyclists.

Now, sir, I ask, Why did the N.C.U. professionalise me if they had no rules dealing with motor-cycles, and, if their rules did cover motor-cycles, why have they since passed a fresh rule to enable them to deal with motor-cycling? I may say that the race I had with Mr. Duncan was entirely a private one, and held on a private track, and was not for any money prize.

The ways of the Union to the ordinary mind were always hard to understand, but lately they have excelled themselves in this particular direction. Anyhow, a little light from one of the superior intellects who do understand and are versed in the laws known unto the N.C.U. on these little points will be appreciated by

London, E.C.,  
May 1st, 1899.

Yours truly,  
CHAS. JARROTT.

#### THE QUALITIES OF THE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I cannot understand why so many complaints have been made by purchasers of the Benz car. The following is my experience.

I bought a Benz Ideal in February last, and after two hours' instruction drove the car the following day with two friends about sixty miles without the slightest hitch or difficulty. The car is not used daily—only about twice a week, and generally for long journeys. During Easter I drove the car with two friends, a portmanteau, and a brass container filled with extra petrol from Southsea to Bristol and back. On the return journey we mistook the road twice, once at Westbury and again after leaving Romsey, when we went into Southampton by mistake, thus making the return journey about 100 miles. On this occasion we left Bristol at 6.10 a.m., and arrived at Southsea at 4 p.m. Deducting two hours for stoppages it leaves about eight hours for the 100 miles, which I think good work considering the load.

Altogether I have driven the car over 1,200 miles. As regards repairs the spring of the exhaust valve has broken twice; the cause of this was owing to the spring fitting too tight to the nut on the bottom of the valve spindle. This has been altered, and I do not think it will trouble me again. I have had the spoon brake lengthened with a piece of steel of the same curve as the wheel, and fitting the tire; this is adjustable with four small set bolts, one at each corner of the spoon, and two countersunk bolts through the piece of steel and the spoon. The car is fitted with Connolly tires, which look as good now as they did when the car was new. I have only had to screw up two nuts on the crank shaft bearing. It seems to me that some of those users who grumble have used a file and spanner too often and the oil can not often enough. I quite agree with the user who says that the best made car would be a failure in some men's hands. I notice that one grumbler used vaseline as a lubricant, but this is only fit for a makeshift—it is too soft. Stauffer's lubricant is the best, costing from 6d. to 8d. per lb.; 1 lb. will last for months. I noticed that my car ran much better on some occasions, and a few days ago I saw sparks leaping from the spring which makes the electrical connection across to one of the nuts on the wood adjusting lever. Thinking that the spring was too close to the nut I loosened it and put it further away, and now the car certainly goes much better. I might say that I have not yet adjusted the vibrator or interfered with the sparking plug in any way. The accumulators have been recharged once and the chains taken up twice.

The foregoing is absolutely all that has been done. I am delighted with the machine, and consider the engine an exceedingly simple one and very well made. I am not interested in the sale of the Benz car in any way, and hope that some English firm will be able shortly to make as good a car at the same price or cheaper.

Southsea, April 27th, 1899.

Yours truly,  
J. WHITE.

## ROAD ACCIDENTS BY HORSES AND MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A shocking accident occurred in King's Lynn on Saturday last, resulting in the death of a little mite aged seven, and another little fellow aged two and a half years being run over and seriously injured.

A horse attached to a heavy tumbril from some unexplained reason took fright and bolted. Dashing along a narrow thoroughfare abounding with small children at play, great consternation was caused. According to one eye-witness, a brave woman ran into the roadway and dragged three tiny mites on to the pavement as the mad animal galloped past. At the end of the row it came in contact with the kerb, where the tumbril rebounded on to the two children, who were just leaving or had just left a shop at the corner. The little girl's left thigh was completely severed, and only held together by a piece of skin, whilst the little fellow was badly injured on the head. The mad career of the animal was only checked by one of the wheels coming off the vehicle against a stone bridge.

Now, sir, one can only read or think of such a case with horror, and yet how many of the British public will ever hear of this awful and serious catastrophe—and how many sensational “penny a liners” will even take the trouble to chronicle the same? Whilst expressing extreme sympathy with the parents of the two children, the terrible thought rises in my mind, “If” such a case had occurred with one or another of my faithful and well-beloved motor-cars, what would have been the consequence and public opinion? God forbid that such cases should even appear to occur with more frequency than they do, but if it were possible for the public to see a complete record of the deaths and disablements caused by horses in this country alone in one year and then compare with a similar motor-car record, the fact would be admitted that the latter are at least safe, if not all that the average public desire.

I have wondered whether any distinct case can be quoted of anyone having been run over by a motor-car, in this country especially.

Motor and Cycle Works,      Yours faithfully,  
King's Lynn.                      FRANK MORRISS.

## MORS v. PENNINGTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On April 14th Messrs. Pennington & Baines challenged the Mors car for a straightaway run, commencing ten miles south of the summit of Shapfell. They then said, “For this match we will enter our two-cylinder motor-car carrying two passengers—the Mors car to carry the same number; but we are indifferent as to whether their car has a 10-h.p or even a 16-h.p. motor, and has two cylinders or four.” Clearly and distinctly, without using any circumlocution or raising any objections, we accepted.

In reply, Messrs. Pennington & Baines have sent a letter to you in which they again alter the challenge originally issued—firstly trying to restrict us to the use of a four-cylinder Mors, secondly trying to mix up this challenge with a new one they are issuing for tricycles, and lastly objecting to a customer of theirs and of ours following the contest.

The shifting ways of Messrs. Pennington & Baines are wonderful indeed—so wonderful that our patience is exhausted. On April 21st we warned them that their challenge of the 14th was the last one we would accept, and to this decision we shall adhere. If Messrs. Pennington and Baines mean to run the race on the lines laid down by them on April 14th we are still willing to do our part, but we flatly refuse to further lend our name to transatlantic advertising of a firm of whom the world so far has seen nothing beyond—words.

Yours faithfully,  
THE AUTOMOBILE ASSOCIATION, LTD.

## SCOTTISH NOTES.

## Motor Pacing.

ON Saturday last the motor-bicycle was seen in Scotland for the first time as a “pacing” instrument. In spite of the inclement weather some 15,000 people turned out to witness the long programme of cycle and other events at the Celtic Park, Glasgow. It was advertised that Messrs. Chase and Platt-Betts would run off a ten-mile match with “motor pacing.” When the motor-tandems turned out for a trial canter it was evident that the vast crowd assembled were keenly interested in the new machines, and motors were proving an “attraction.” The track was wet from the recent rainfall, and we were doubtful if the “motors” would successfully negotiate the highly-banked corners, especially at a slow speed. Our doubts were confirmed when at the northern corner the first motor had a “spill.” Further trials were confined to the inside flat cinder track, where of course only a moderate pace was obtainable. The result was that the promised match fell through, and the spectators had to be satisfied with merely a motor-car parade on the “cinders.”

## A Stirling-Leyland Bus.

A STEAM omnibus to seat eighteen to twenty passengers, built by Stirling's, of Hamilton, and engined by the Lancashire Steam Motor Company, has this week been going through its preliminary trials, and I learn that it has acquitted itself in the most satisfactory manner. The design of the body is exceedingly graceful and well proportioned. The engine and boiler are placed in a front cabin which is furnished with the driving-seat and all the appointments necessary for the control and management of the bus. The vehicle is roomy inside, well ventilated, and extremely comfortable. The windows, which are large and give a light and airy appearance, are made movable. They are hinged at the top and can be opened or closed as required, or they can in summer be entirely removed from the vehicle. The carriage therefore can be used either as a closed bus or open brake or *char-a-banc*. The bus has been built to the order of the Dundee and District Tramway Company, to whom it will, I understand, be delivered in the course of a week or so.

## Motor Dust-Cart for Glasgow at Last.

FOR several years the Cleansing Department of the City of Glasgow have had under consideration the introduction of motor dust-wagons, and a few months ago I believe invitations were issued to the makers of heavy motor-cars throughout the country to submit tenders for a dust-cart to carry a load of four tons. I understand that the well-known makers of the various steam wagons which took part in the Liverpool trials last year were among those to send in offers. From a minute of the sub-committee submitted to the Council on Monday, it appears that it had been agreed to accept the offer of the Motor-Car Syndicate, Ltd., Glasgow, to provide an electric wagon at the price of £532. It is interesting to note that the Committee have selected an electrically-propelled wagon for their work, and I have little doubt the decision will be received with considerable surprise by many who have been watching the growth of heavy motor traffic. The Lord Provost, I observe, intimated that it was merely an “experiment,” and I am afraid the vehicle to be built must be so regarded. I sincerely trust that the electric wagon when put into the hands of the Corporation will do all that is required of it, as after waiting so long it would be a great disappointment if it failed. It would certainly have been a safer course for the Committee to have selected, to begin with, a vehicle built on a system which had been tried and proved; for example, the Lifu or Leyland steam carts, which have made such satisfactory performances elsewhere.

**The  
Scottish  
Club.**

THE meeting in connection with the formation of a Motor-Car Club for Scotland held on Wednesday was well attended. This gathering was, of course, purely preliminary. The project was fully discussed, and arrangements made whereby another meeting would be held at an early date, at which Mr. Johnson, Secretary of the Automobile Club, would be present. Of this event due notice will be given in these columns.

**Edinburgh  
Again.**

FROM the activity and interest manifested in the Scotch metropolis just now in motor-cars, it would appear that Edinburgh is a splendid field for enterprising people who wish to make money. The tramway service in most places is inadequate and slow, and I understand petitions are being signed in more than one district requesting the concerns now running motor-cars in the principal streets to extend the service to others. The Edinburgh Autocar Company, I believe, have more business offered them just now than they can overtake. There is, I think, a good opening here for introducing motor-buses capable of accommodating fifteen to twenty passengers to suit this traffic.

"BROWN HEATHER."

THE Vienna local authorities have given permission for fifty motor-cabs to ply for hire in the Austrian capital.

THE Val de Travers Asphalte Co., of Bishopsgate Street Without, E.C., are desirous of purchasing one or more wagons to carry three tons, at a speed of five miles per hour. Will makers kindly communicate with them?

AT Kenilworth on Wednesday, Mr. Ambrose Valentine of 4 Heath Terrace, Milverton, was summoned for driving a motor-car at Kenilworth which did not display a red light behind as required. The magistrates imposed a fine of £1, including costs.

THE trustees of the Duke of Bridgewater, who have established a successful dairy business at Eccles and Worsley, are now using motor-cars as vehicles for distributing the milk in the two districts. The sight of these novel milk carts, which are quite artistically furnished, in the streets of Eccles has naturally created no little interest.

DR. COLOHAN, of Blackrock, Co. Dublin, who has undertaken to run his car from Dublin to Galway (135 miles) within a period of twelve hours, is having a special Benz car sent to Dublin to enable him to accomplish this ride. This car, it is rumoured, can take hills 1 in 4. Dr. Colohan is himself very confident of success, and, given that there are not many inclines of 1 in 4, there is no reason why he should not be so.

THE Coventry employés of the Motor Manufacturing Company held a concert at the Coventry Cross Hotel on Friday evening last. The concert was arranged for the purpose of presenting Mr. T. H. Norris, who had been employed during the last two years at the Company's works as a foreman turner, and who is severing his connection with that firm, with a watch as a tribute of his fellow-workmen's good wishes. Mr. W. Tipler presided over a gathering of about eighty, and Mr. E. Preston was in the vice-chair. In making the presentation, Mr. G. Barrett said he was only expressing the feelings of the fellow-workmen when he wished Mr. Norris every success in his future career. He then handed the recipient the watch, which bore the inscription, "Presented to Mr. F. H. Norris, foreman turner, by the employés of the Motor Manufacturing Company, as a mark of esteem towards him on resigning that position.—Coventry, May 1st, 1899." Mr. Norris briefly returned thanks, remarking that the present had come as a complete surprise. The remainder of the evening was devoted to songs, etc.

## H. J. LAWSON'S LATEST MOTOR-BICYCLE.

UNDETERRED by the non-success of a large number of both French and English experimenters, Mr. H. J. Lawson has devoted his energies for some long time past to the production of a satisfactory motor-bicycle. Mr. Lawson seems to attach infinite importance to the solution of this problem, holding that on its being solved there will be a boom in motor-bicycles similar to that lately existing in the palmiest day of the "safety." Many, of course, do not agree with Mr. Lawson, and those who have previously endeavoured to produce a satisfactory motor-bicycle have, in the majority of cases, given up the problem in despair of its being successfully solved.

In Mr. Lawson's latest production, the motor, as will be seen from the accompanying illustration, is placed on one side of the back wheel, its fly-wheel balancing it on the other. The motor is stayed by being fixed to two brackets fastened to the back wheel. The crank shaft, of course, passes through the rear wheel, and the speed reduction is attained by means of epicyclic gearing connected up to the inside hub by a clutch. The motor is designed to develop  $1\frac{1}{4}$  h.p., the bore of the cylinder being 4 millimetres and the stroke  $2\frac{1}{4}$  inches. Ignition is by an incandescent tube heated by a burner supplied from an independent tank fitted with a pressure pump. The brakes are powerful and so coupled to the carburetor that at the time of their application the supply of explosive gases is automatically cut off from the motor. The tank carried at the rear of the saddle is oval in shape and fulfils a four-fold purpose. It contains the supply of spirit, a special carburetting chamber, a lubricating oil chamber, and a pressure tank fitted with pump for the supply of spirit to the burner. Speed is regulated by the coupled brake and mixture control device, and also by varying the air supply. By the release of the clutch, controlled by a small screw-handle placed on the head of the machine, it is possible to cut off the power transmission from the bicycle. It then runs without the motor working at all, so that the machine can be pedalled quite easily without having to work against the motor when this is cut out; this device can also be used when coasting, etc.

A DE DION motor-tricycle with trailing car has made its appearance in the Phoenix Park, Dublin, and as this is the first of its kind in Dublin it has caused quite a sensation. The rider was one of Lord Ardilaun's sons, the Hon. R. Guinness, who has also been seen steering a beautiful motor-wagonette carrying six persons through the principal streets in Dublin. Sometimes also he has been seen in difficulties with a Bollée voiturette.

# Motor-Vehicle Contests at the Crystal Palace.

DIAGRAMMATIC VIEW OF COURSE FOR CONTROL CONTESTS.

THE Motor-Car Club's "fête" at the Crystal Palace, Sydenham, on Saturday next promises to be the most important "meet" of motor-vehicles yet held in this country. We are informed that if all the promises are kept there will be considerably over 150 motor-vehicles in attendance, and although all these will not take place in the preliminary "meet" on the Thames Embankment, yet a large number will certainly attend.

The committee, with whom the Crystal Palace authorities are working most heartily, have been eminently successful too in securing entries for the "control contests," no fewer than 63 entries having been received. The classes and entrants are as follows:

Class A.—Motor-tricycles that can be assisted by pedalling; 14 entries, viz.: Rowland Winn, J. W. Stocks, F. F. Wellington, E. Sinclair, H. Clark, Motor Manufacturing Co. (2 entries), R. A. Bauer, C. Rush, C. Jarrott, E. A. Gorton, F. Whittaker, Automobile Association, Ltd., and Hon. C. S. Rolls.

Class B.—Motor-cycles that cannot be assisted by pedalling; 10 entries, viz.: F. Watson, Motor Manufacturing Co. (2 entries), G. Dederich, A. Barker, G. Riches, F. F. Wellington, G. Ibbetson, C. H. Schofield, and C. Jarrott.

Class C.—Light carriages, weighing over 4 cwt. and under 10 cwt.; 11 entries, viz.: Hewetson's, Ltd. (2 entries); G. D. Barnes, G. Dederich, Daimler Motor Co., R. W. Buttemer, C. Rush, J. O. Seyd, M. Cappeleot, Hon. C. S. Rolls, and Automobile Association, Ltd.

Class D.—Motor-carriages, weighing over 10 cwt.; 24 entries, viz.: Hewetson's, Ltd., G. H. Fell, E. Estcourt, C. Machine, S. F. Edge, E. C. Muir, F. F. Wellington, F. H. Butler, E. K. Purchase, Motor Manufacturing Co.

(4 entries), C. Friswell, Daimler Motor Co. (3 entries), G. Soames, C. Parker, H. J. Lawson, E. H. Clift, C. Jarrott, Automobile Association, Ltd., and Hon. C. S. Rolls.

Class E.—Delivery vans under 2 tons tare; 4 entries, viz.: F. F. Wellington, Motor Manufacturing Co. (2 entries), and Ormiston and Glass.

The course, over two miles long, is shown in the accompanying plan. It has been arranged so that all classes of roads, turnings, and ascents and descents are included, and compulsory stopping places are provided in different parts of its length, in order to demonstrate the ability of the drivers to control their vehicles and to bring them to rest and start them again at the word of command.

The entries for the five miles motor-tricycle invitation race are, we are informed, very satisfactory, and the match, over five miles on the track, between such old antagonists as S. F. Edge and C. G. Wridgway, will doubtless be watched with considerable interest by those who appreciate track racing.

It is evident that, given fine weather, the meeting will be an interesting one, and the Motor-Car Club is to be congratulated on the success promised to this its first organized meet since its emancipation from the control of Mr. H. J. Lawson.

A COMPANY under the name of G. F. Smith, Limited, was registered on April 22nd, with a capital of £25,100 in £1 shares, to acquire the business carried on by G. F. Smith at Paragon Ironworks, South Parade, Halifax, and to carry on the business of machine tool makers, ironfounders, engineers, cycle manufacturers and dealers, motor-car builders, brassfounders, etc.

## MOTOR-CARS ON THE CONTINENT.

### Electric Vehicles for the Paris Fire Brigade.

ELECTRIC motor traction has been successfully tried and will shortly be put into use by the Fire Brigade in Paris. A motor-car has been constructed to carry the escape ladders, cords, and other appliances, and eleven passengers. The vehicle is provided with an electric motor, the accumulators being placed underneath the body of the carriage in which stands the fire escape. When put through its trials the new car, fully equipped and conveying the engineer, the brigade officer, his orderly, and eight firemen, behaved very well, keeping up a speed of fifteen miles an hour and negotiating inclines, which in Paris are considerably more steep than in London, without difficulty. It was also ascertained that the vehicle could be brought to a dead stop in a few yards. The new motor-car will be put into use at the headquarters of the Paris Fire Brigade. It is expected that all the stations of the city will be provided with similar vehicles in due course.

### Speed of Motor-Cars in Paris.

THE Paris correspondent of the *Daily Telegraph* remarks that "motor men as a rule no longer rush at full speed through the streets of Paris, for a salutary check has been put on their destructive tendencies by strict police regulations. They are evidently determined to obtain some compensation for this by trying to run down people in the Bois de Boulogne. Some of the avenues in that wood, which, owing to the arrival of fine weather, is now crowded daily, are used by the motor men in quite a proprietorial manner. Horseless vehicles dash along in every direction, heedless of hapless pedestrians, grazing the sides of horses or the legs of the people riding the same, and occasionally coming into collision with a carriage or a cab. The rangers of the Bois maintain that they are powerless to stop the veritable brutes who pound along the leafy avenues utterly careless about grinding the life out of some unlucky man, woman, or child on foot. Bicyclists can easily be called to order, but the motor people are out of sight in a moment, and the rangers pant after them in vain. The Comte de Cossé Brissac, who has witnessed in the Bois some narrow escapes from collisions between motor-cars and persons in the saddle, has written a strong protest to the Prefect of Police. It is possible therefore that efficient measures will soon be taken in order to compel the fast-increasing crowd of motor men to slacken their speed along the avenues of the wood, as well as in the streets, where they are compelled to obey the regulations."

### The Lyons Motor-Car Club.

ON the 29th ult., at 8.30 p.m., a meeting was held at the Café de La Bourse, Lyons, in reference to the foundation of the Lyons Motor Club. At this meeting thirty-eight *chauffeurs* accepted the club rules and became members. They subsequently elected their managing committee. M. Collin has been elected the president for the current year.

### Automobilism at Calais.

THIS year, owing to the generous and energetic impulse of M. Gustave Cordier, who is one of the first *chauffeurs* in Calais, an Automobile Club is to be founded. The committee entrusted with the work of elaborating the regulations of the Club is formed of the most prominent men of the locality, with M. G. Cordier at their head. It is receiving new applications every day, and it is said that already more than one hundred gentlemen have applied to become members of the Automobile Club Calaisien. We learn that the promoters intend to do great things. They

have already secured a large private house, containing salon, smoking and reading rooms, etc., on the first floor, as well as a large hall on the ground floor, where carriages can be placed. We wish the Automobile Club Calaisien every possible success.

### The "Turin Cup."

As previously mentioned, the Italian Automobile Club organized, for the first time this year, a contest called the "Turin Cup." This competition took place on the 1st inst. between Turin (Porte de France) and Bussolino Suse and back. The weather was splendid and the meeting quite fashionable. Gasté gave a brilliant performance, covering the 100 kilometres, over very bad roads, within 2 h. 24 m. 5s., the second competitor being Willaume, and the third, Velox. The cup will remain in the charge of the I.A.C., and inscribed to the effect that Gasté is the champion over 100 kilometres for 1899. A diploma of honour is awarded to the builder of the winner's motor-cycle. Gasté will have the right to the cup if nobody surpasses his record during this year.

### Paris-Bordeaux Race.

THE race between Paris and Bordeaux, through Chartres, Chateaudun, Tours, Poitiers, Angoulême, will be held on May 24th, the course being 565 kilometres long. Seventeen carriages and nine motor-cycles have been already registered, and the contest promises to be very interesting. The race is organized by our contemporary, *Le Velo*, with the support of a few Bordeaux sportsmen. The competitors have to be at Suresnes bridge on the morning of the race at 2 a.m., in order to sign the controlling book. Ten thousand francs will be awarded as prizes to winners, as follows:—In the motor-carriages and voiturette class—first, frs. 4,000; second, frs. 1,500; third, frs. 1,000; fourth, frs. 500; fifth, frs. 300. In the motor-cycle class—first, frs. 1,500; second, frs. 500; third, frs. 300; fourth, frs. 200; fifth, frs. 200. The strict conditions are laid down that prizes to be awarded to motor-carriages and voiturettes will not be, under any circumstances whatever, distributed to motor-cycles should those last arrive before vehicles of the former category. The Bordeaux Organizing Committee has had the good idea on this occasion of opening in Bordeaux a large exhibition of automobiles and cycles. Bordeaux will see, in fact, three races within a few days, viz., the Paris-Bordeaux contest, the Bordeaux-Paris race, and the Bordeaux-Perigueux-Bordeaux race. The exposition will be opened on Friday, May 19th, and be closed on the following Friday, May 26th. It will take place in Les Quinconces Square. It will be certainly both interesting and instructive to be able to examine and compare the different types of the victorious carriages in these three contests. Among the entrants for the Bordeaux-Paris race are Mr. S. F. Edge and Mr. Charles Jarrott, both well-known English motor-cyclists.

### High-Speed Motor-Vehicle Contests.

THE tremendous speed of 65½ miles per hour has been attained last Sunday by M. Jenatzy, the untiring antagonist of the Count de Chasseloup-Loubat. The Count's records were not, in fact, easy to surpass; these were: 38½ seconds for one kilometre, with a flying start, and 48½ for one kilometre with a standing start. Of course, this could not have been done by the aid of any accumulator in the past, but by the improvement in scientific construction Jenatzy has broken these easily. The new champion of electric carriages has covered the first 1,000 metres within 47½ seconds, which is only a little less than Count Loubat. But it is to be noticed that M. Jenatzy starts comparatively slowly, in order that his speed at the finish may be extraordinary, as the last 1,000 metres have been covered within the wonderful time of 34 seconds, which beats every record

of the world for any kind of road locomotion, and gives an average of  $65\frac{1}{2}$  miles per hour! It is really astonishing that such a speed could be obtained. Surely M. Jenatz's performance of rushing through the air with his torpedo-shaped monstrosity, by courtesy termed a carriage, at this enormous speed will be permitted to stand indefinitely without further seeking to break this marvellous record. In spite of uncertain weather there was a crowd who gathered at Achères to assist the spectacle, among these being Baron H. de Rothschild, Messrs. Charron, De Kuyff, De Chasseloup-Loubat, De Santos Dumont, etc. At three p.m. sharp the Jenatz's carriage is in line ready to go. Jenatz is evidently anxious and nervous, but waits the starter's orders with patience. The starter cries, "Beware! be ready . . . and go!" and the "Torpedo" flies between two rows of human beings, who applaud Jenatz's cool skilfulness with all the excitement peculiar to the French nation. A very interesting calculation has been made in regard to this wonderful performance. M. Jenatz drove a carriage mounted upon wheels of 80 centimetres diameter. The wheels had therefore a circumference of 2.50 m., and had to make 400 revolutions in completing the kilometre. Thus the road wheels had to make twelve revolutions per second! Such performances are certainly astonishing, but they are none the less ridiculous and unnecessary.

#### Motor-Car Workmen in Paris.

THE companies formed for the manufacture of motor-cars who have constructed extensive factory buildings in the west of the Paris suburbs, notably at Suresnes, Puteaux, Courbevoie, and Levallois-Perret, are in a curious state of deadlock. The reason is that the skilled mechanic and engineer declines to leave the Ménilmontane quarter where he has been accustomed to reside for generations, and the journey to and from the western suburbs involves too great a loss of time and wages. The consequence is that several of the great motor-car manufacturing houses, among others MM. Clement et Cie, propose to abandon their present factory buildings, constructed at a vast cost, and to remove nearer to where their best workmen live. The pecuniary loss involved by this necessary measure threatens to cause a crisis.

#### New Motor-Car Clubs in Germany.

MOTOR-CAR clubs are beginning to spring up in all the large towns in Germany. One is in course of formation at Stuttgart, to be known as the Wurtemberg Automobile Club, while at Aix-la-Chapelle the West German Automobile Club has just been started, with Herr Küpper as first president. The last-named club has soon got to work, for we learn that it is organizing a race for motor-cars and cycles between Aix-la-Chapelle and Coblenz, a distance of ninety miles, to be run off on Sunday, the 14th inst.

#### The Berlin Motor-Car Exhibition.

IT is announced that the whole of the available space at the International Motor-Car Exhibition, to be held in Berlin this summer under the auspices of the Mid-European Motor-Car Club, has already been applied for. Arrangements have been made with the German Customs authorities providing for the free importation of foreign vehicles intended for the Exhibition.

#### Public Motor-Car Services in Austria.

IT is currently reported that quite a number of applications have been made to local authorities in Austria for permission to start public motor-car services in different parts of the country. Among others, such services are projected between Aspang and Hartberg, between Kernhof and Mariazell, and between Baden and Mödling.

## PETROLEUM MOTOR-VEHICLES.\*

By JAMES D. ROOTS, A.M.I.M.E.

IT is not the intention of the author to touch upon the history of motor-vehicles at the early period when they were exclusively steam driven, nor to deal with their construction at that time. For not only has their history but also their construction been most thoroughly dealt with in various journals and papers since the Locomotives on Highways Act of 1896 came into force. During that early period there can be no doubt that most effective road carriages were built and were in daily operation. It must be remembered, to the credit of the workers in the early stage referred to, that the steam engine itself was in a state of infancy, and that the road locomotive was progressing side by side with its brother, the locomotive of the rail.

If the blindness and unwisdom of the Legislature in conjunction with popular prejudice and unreasoning conservatism, the objection to anything new, had not strangled the infant of the road, it would have been by now as matured and powerful an adult as its brother of the rail, or, to drop metaphor, road locomotion by steam and other sources of power would have been as perfect, as complete, as reliable and as advanced as locomotion by rail. To understand what this would have effected for us in cheapness of locomotion, comfort and convenience of internal communication, we have only to reflect what our condition, and indeed the position of civilisation, would be to-day if rail locomotion had also been hampered and prevented by the unwisdom of our law makers and the prejudice of the public. If we try to realise what the world would be at the present day without rail locomotion, we can then grasp in some measure what a loss there has been to the world and civilisation by the strangulation of road locomotion shortly after its inception and inauguration.

Consider what the position of road locomotion would have been if, as we may fairly assume, the same number of engineers had devoted their time, thought and energy to the improvement of the road locomotive as in each generation since 1830 have employed themselves in the furtherance, improvement and development of locomotion by rail. The high, and in some cases prohibitive, freight charges upon certain railways would now be impossible. The transport of all goods would have been cheaper, thus lessening the cost of country produce and market garden stuffs and other goods to a great extent, especially in large cities. Cheapness of transport will naturally cheapen the cost of all the necessities of life; cheapness of transport by road would have cheapened freight by rail. Moreover, our roads would be better and wider, and would not be allowed to get into the bad condition we now find them in every autumn and winter, and it would be a finable offence on the part of any local authority to put down granite or stones on the roads without immediately rolling them in. It would equally be an offence to allow any road to get below a certain level of standard excellence. Travelling and inspecting surveyors would ere this have been appointed by the local governing body in each county, and if any road should be found by an inspector to be below a predetermined standard of excellence, the local authority in whose district they were should be summoned to answer the charge before the Quarter Sessions. Permitting a bad road should be made a punishable offence, and it will be made so in time.

Between the years 1835 and 1886 various sporadic attempts were made with steam to resuscitate the road motor movement in this country and to reintroduce a motor-vehicle, but being promptly sat upon by the absurd law in force, these attempts never attained maturity; indeed, they were never allowed to get beyond the experimental stage. The progressive movement of road locomotion was, however, born again in countries where the legislative restrictions were

\* A paper read before the Society of Engineers, May 1st, 1899.

fewer than in ours, or were non-existent, and where prejudice was less supreme.

In the year 1885, Daimler, at Cannstadt, Wurtemberg, commenced work upon the problem of road locomotion, and in September of that year he took out in this country a patent for a motor-propelled bicycle. The specification is No. 10,786, September 11th of 1885, and it is entitled "Improved Vehicle propelled by a Gas or Petroleum Motor-Engine." The construction illustrated, as indeed might be expected of one of the pioneer attempts, is very crude. It is like the old bone-shaker with a petroleum motor placed

FIG. 1.

FIG. 2.

between the two wheels, with two small trailing rollers, one each side, to prevent the bicycle falling over when not in motion. Figs. 1 and 2 are reproduced from the specification above referred to. Fig. 1 is an elevation and part section of this machine, and Fig. 2 is the plan.

A is the steering wheel, B is the driving wheel, C is the crank shaft of the motor, D the crank chamber, E the cylinder, F the exhaust valve, operated by the rod G, which makes half as many reciprocations as the crank shaft makes revolutions. H is the admission or inlet valve, I the ignition

FIG. 3.

tube, J the burner, and K is the outlet of the exhaust pipe which has been passed through the carburettor to raise the temperature. It will be seen that this motor is somewhat similar in arrangement and appearance—except that it has a single cylinder—to the Daimler car motor of the present day.

On the crank shaft C is the pulley L having the endless cord or band M passing round it. This also passes round the pulley N fixed on the driving or back wheel. The grooved jockey pulley O is fitted to the end of a lever, and by

twisting the steering handle Q in one direction and tightening the connecting cord this jockey pulley was raised and the belt tightened, so that the motor drove the driving wheel. If the steering handle was twisted in the opposite direction, the jockey pulley was lowered and the belt slackened, so that the belt ceased to drive. But while the jockey pulley was being slackened, the handle was tightening the continuation of the same cord which is attached to the brake R, thus bringing it into contact with the rim of the driving wheel. The inventor of this machine had the curious idea of warming up the bicycle seat by means of the exhaust gases. The small rollers S were for steadying the vehicle in the vertical position, presumably when stationary, for they would not be of much use when the bicycle was in motion.

There had been one or two specifications filed in the British Patent Office before the date of the Daimler specification relating to petroleum vehicles, mostly for tramways, but the author does not know if these were ever made or tried. Louis Hardaker, of Leeds, also took out a patent for a tricycle propelled by a gas motor. This is probably the

FIG. 4.

FIG. 5.

first light vehicle of the cycle description propelled by an internal combustion engine. The patent is No. 2,290 of 1880, and dated June 7th. The author has not yet been able to discover whether a tricycle was actually made or not, and has therefore given Daimler the first place.

Fig. 3 shows the Hardaker motor-tricycle. A is a reservoir in which explosive gases are stored under pressure. B is the cylinder in which the charge is exploded, the piston driving by means of a connecting rod (not shown) attached to a crank which forms part of the main axle C. The charge is stated to be fired by electricity, and the motor was clearly intended to be started by means of the pedals. The description is vague, and the author does not think that, as described, it could have been a practical machine. It is, however, interesting as being probably the first internal combustion motor light road vehicle or cycle, but it was intended to use gas as a motive agent.

Except in the cause of Hardaker and for the reasons stated, the author will endeavour to deal with the other vehicles approximately in their chronological order. Carl Benz, of Mannheim, was, the author believes, the next in order of date to attack the problem of petroleum locomotion. Fig. 4 is an elevation and Fig. 5 a plan of a Benz car, as shown in the specification, No. 5,789 of 1886. A is the jacketed cylinder of the motor, B is the crank-shaft placed vertically, C the fly-wheel placed horizontally. The idea of

this arrangement was that a fly-wheel placed in the usual way vertically would by gyrostatic action interfere with the steering of the vehicle. *D* is a counter-shaft driven by the bevel gearing *E*. The shaft *D* carries the pulley *F*, which is fixed on the shaft. *G* is the spirit tank, *H* is a water cooler connected to the jacket, consisting of a series of pipes arranged parallel with the axle, which is not shown in the plan.

*I* is the counter-shaft carrying the pulleys *J* *K*. *J* is a fixed pulley driven by belt on the pulley *F*, and *K* is a loose pulley. *L* is the operating lever which shifts the belt from the fixed to the loose pulley. *M* is the mechanism used for shifting the strap from the fast to the loose pulley. *N* is a brake pulley. *Z* *Z* are the two chain wheels driving by means of the chain and chain wheels on the vehicle back wheels. Differential gear is attached to the shaft *I*. *O* is the steering link connected to the front wheel, and operated by means of the rack and pinion at the foot of the steering-rod *P*.

(To be continued.)

### MOTOR-CARS AND THEIR SPEED.

ARCHIE MILLERSHIP, a respectably dressed young man, of 36 Highfield Road, Birmingham, was summoned at the Bournemouth Petty Sessions for furiously driving a motor-car at Bournemouth on April 9th. Mr. C. J. Lacey defended. P.C. Burgh stated that on Sunday, the 9th ult., at 10.45 a.m., he was on duty at the Lansdowne, when defendant came along from Boscombe with a motor-car in which were two other gentlemen. The car was being driven at a furious rate, from sixteen to twenty miles per hour. He went down the Old Christchurch Road. Witness stepped in front of the car, held up his hand, and shouted for him to stop. Witness could not say whether defendant saw him, but he took no notice, and did not stop. There was a lot of people about the street, as it was just before church time. After the car had passed several complaints were made as to the furious driving. On the following day witness saw defendant at Westbourne, and asked him whether he was aware that he was going at a furious pace on the previous day? Defendant said he was aware he was going at a brisk pace, but did not think it was furious. He said as the accumulators were fixed he did not think he could travel at more than eight miles an hour. Witness told him he should report him for furious driving.

In cross-examination, witness said there were a number of persons crossing the road when the car came along. He did not see any one absolutely in danger, although two gentlemen had to run to get out of the way. Witness was a bicyclist, and could judge of pace.

P.C. Ansell said he was on duty at the Arcade when the motor-car passed, coming from Lansdowne. It was going at a furious pace, and witness shouted to defendant to stop, but he took no notice of the warning. There were a lot of pedestrians about the paths and roads at the time. Witness walked down to Tyrrell's corner, but by that time the car was out of sight. It went past like a flash of lightning. In cross-examination, witness said he did not see any one endangered. Witness was accustomed to horses, and had driven twelve miles in fifty minutes. The car was going a long way faster than a horse travelled.

George Rathew, cab driver, of Wyndham Road, Springbourne, said he saw the car pass through the Lansdowne, and it would have been impossible for them to have pulled up if they had wanted to prevent an accident. He considered it was going at a pace of seventeen or eighteen miles an hour. In reply to Mr. Lacey, witness said he was a cabman, but did not object to motor-cars if they kept their right side and did not go too fast. In this case the car was going faster than any race horse. Mr. Lacey: Come, yours is a good horse. It could have kept up with this?—Witness: Well, you know better than I do.

Mr. Lacey submitted that no person was endangered, nor did defendant risk an accident. He submitted that the car was not travelling at a greater rate than the twelve miles an hour allowed by the Light Locomotive Act, 1896. Defendant was only working on the accumulators, and at a moderate pace, to prevent breaking his chain. He could have pulled up within three yards on the morning in question, owing to the stout brakes.

Thomas Carpenter, commercial traveller for cycles, of Coventry, stated that he knew this car. It could be stopped in three yards, or even in a yard. They could stop "dead" and throw all the passengers off. (Laughter.) On the morning in question he was riding with defendant from Boscombe. At no time was there any danger to foot passengers. They did not see any police officer. They were afraid to use the car at more than a moderate pace—from ten to twelve miles an hour—as they were afraid of an accident to the chain, and they had to ride back to Birmingham, which they did. There was no indicator. The average speed was about ten or twelve miles. It might be five miles going up hill, or greater coming down. The Chairman: You might drive it eighteen miles down hill, I suppose? Witness smiled, and said he supposed so. By Superintendent Foster: The weight of the car was about 19 cwt.

The Chairman said the Bench considered defendant was driving too fast, and there were points about the case which made it rather serious. The practice must be checked, and they hoped that the penalty inflicted would act as a deterrent; if not, they must impose a heavier penalty next time. Defendant would be fined £1, including costs.

### A PROPOSED MOTOR-CAR COMPANY.

BEFORE Mr. Justice Day and a special jury the case was heard, on the 1st inst., of *Cock v. Elieson*. This was an action brought by Mr. John Cock against Mr. C. Prosper Elieson, an electrical engineer, of West Kensington, for specific performance of a contract dated July 30th, 1897. In the alternative plaintiff claimed damages for breach of contract. Mr. Jelf, Q.C., and Mr. D. Stewart Smith were counsel for the plaintiff, while Mr. Carrington represented the defendant. It appeared that the defendant had patented certain improvements in relation to the driving gear and accumulators of motor-cars, and in July, 1897, he entered into an agreement with the plaintiff, who was the nominee of Mr. Martin Fradd, a financial agent, to transfer his patents to a company to be called the Elusin Lamina Accumulator Company, Limited, in consideration of his receiving £100 down, £900 out of the sale of shares, and 10,850 fully paid-up £1 shares in the company, and being appointed managing director of the company for five years at a salary of £600 a year. Plaintiff's case was that after the defendant had received the £100 and his salary at the rate of £600 per annum for something like fifteen months he refused to transfer the patents. Defendant said he had always been ready and willing to carry out his part of the agreement if the plaintiff had performed his by paying him £900 and getting the company to transfer to him 10,850 fully paid-up shares and to appoint him as managing director at a salary of £600. The defendant further said that the company had offered 12,000 shares to the public, but only £10 was subscribed. The jury found a verdict for the plaintiff for specific performance, and also awarded him £50 damages. Judgment accordingly, with costs.

### FAST DRIVING OF A MOTOR-CAR.

At Lancaster on the 29th ult., Arthur K. Haythornthwaite, a music professor, was fined 40s. and costs for driving a motor-car on Caton Road, the Bradford-Morecambe record course, at greater speed than twelve miles an hour, shortly after 1 a.m. Two police-officers timed defendant, who covered a mile in three minutes and twenty-five seconds. Will Brash a local cycling champion, said the speed did not exceed ten miles, and a motor-car engineer corroborated.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, MAY 12th, 1899.

[No. 10.]

Published by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

SOMETHING of a sensation was caused at the Crystal Palace last Saturday by the rumour that the Hon. Cecil Rhodes was amongst the visitors, and while the gentleman mistaken for that celebrity was talking to Mr. Cordingley quite a big crowd assembled. There is no doubt Col. Gourrock, for that was the gentleman's name, is a double, both in features, breadth, height, etc., of the better known celebrity, and his riding "get-up" caused the excusable mistake. Col. Gourrock, we believe, was formerly partner with Mr. Edison, and is now connected with the Edison and Swan Company.

### The New Benz 8-h.p. Car.

THE new 8-h.p. car which Hewetsons, Ltd., are placing on the market appears to be a thoroughly satisfactory vehicle in every way. We had the pleasure of journeying on this car from Westminster to the Crystal Palace on Saturday last, and were extremely pleased with its performance. It ran quite silently and at a very high speed, whilst not one of the hills encountered proved any obstacle to the use of top speed. It carried four heavy people with ease, and we are satisfied that it will prove an ideal car for those who desire to travel at a high speed on the level and to have at the same time a strong reserve of power for hill-climbing.

### The Mors-Pennington Challenges.

FROM the correspondence appearing in other columns of this issue it will be apparent that at last there is some appearance of the complicated series of Mors and Pennington challenges being brought to a final conclusion within a reasonable period. From a telegraphic dispatch received from Messrs. Pennington & Baines we learn that they have fallen into line with the Automobile Association, and have accepted the propositions made in our columns last week. It has now been agreed that each party to the challenges shall nominate two gentlemen to act as representatives, who shall formulate the conditions under which the contest shall be run, and make all arrangements for the time at which the event is to take place, and to generally settle the details. We have received from the Automobile Association the names of two gentlemen whom they have asked to act on their behalf, and we now only await their consent to this appointment before arranging a meeting with the two gentlemen whom Messrs. Pennington & Baines are nominating. At their first meeting these four gentlemen will be called upon to jointly nominate a fifth, who shall act as chairman of the control committee and be referee in case of disputed points arising. We fail to see how the contest can be run off in one day. It will be remembered that the course laid down starts ten miles south of the top of Shapfell. The vehicles are to mount this practically continuous gradient twenty-five times, and to do this it will of course be necessary for them to descend at least twenty-four times. Thus the total length of the journey

must be practically 500 miles, and cannot be less than 490. Even if a start be made early in the morning, we do not think it would be possible for the contest to be completed in two days, as the vehicles are not permitted to run down the gradient at a speed greater than that at which they ascend it. And in view of the fact that speed is not likely to exceed a reasonable limit, three days will probably be necessary. All these matters, however, remain to be settled by the nominees of the contestants and the referee. We will take care that our readers are duly acquainted with the progress of arrangements as they are made, and we hope in our next issue to announce the definite date on which the challenges will be fought out.

### "Motor Words."

AN American contemporary offers some suggestions in regard to the creation of an automobile vocabulary which should be of considerable value to those of our contemporaries who desire to lead in this movement. It holds that "automobile" is much too cumbersome for ordinary use in the English language, and suggests that it might be decapitated and curtailed with advantage, so that only "tomo" should remain. We can imagine the surprise of an automobilist when asked whether his "tomo" was in good running order! Elaborating on its ingenious but none the less ridiculous ideas, our American contemporary suggests that a vehicle fitted with an explosion or impulse engine should be termed a "plotomo," presumably tacking on the middle syllable of explosion; that a vehicle propelled by electricity taken from storage batteries should be termed a "batomo"; and that one propelled by steam should take the symbol for water ( $H_2O$ ), and be called a "hotomo." Will these suggestions be adopted by our contemporaries? For our part we shall rigidly eschew their use, and we think the automobile world generally will do likewise.

### Motor-Tricycle Track Racing.

WE are informed by the officials of the Motor-Car Club that they have made arrangements with the Crystal Palace Co. to hold a series of motor-cycle races on the track on Whit Monday. The contests are open to any type of machine of bicycle or tricycle formation fitted with motors, whether pedals are fitted or not, and will comprise the following events: A twenty-mile scratch race for machines capable of running a mile in under two minutes; a ten-mile scratch race for machines not capable of running a mile in two minutes; a one-mile handicap for machines capable of running a mile in under two minutes; and a one-mile handicap for machines not capable of running this distance in two minutes. It is also probable that at least one match will be arranged, as there are several gentlemen who are desirous of cutting down Mr. C. Jarrott's record of Saturday last. Indeed, from all we can hear this will be done without much difficulty, as several new machines specially constructed for the purpose will appear on the track on the next occasion. These contests will be run under the Motor-Car Club's track-racing rules, and will be timed by the Club's official timekeepers.

# Liverpool and New Brighton

## Motor-Vehicle Service.

THE FIRST PUBLIC MOTOR ROAD VEHICLE IN THE LIVERPOOL DISTRICT.

WE illustrate the above vehicle not because it in itself presents any very novel or peculiar features, not for the reason that its passengers are persons of the *haut-ton*, and not for the reason that it has accomplished any very extraordinary task or performance. We give this engraving solely for historical purposes. The first passenger railway in the kingdom was inaugurated in Lancashire, and although that county cannot lay

claim to being the first in which public motor-vehicle services were established, yet it will, at some period of history, be desired to know what type of motor-vehicle was first employed in the Liverpool district for public service. Hence our engraving. This car is one of eight vehicles which are being put upon the road immediately, on routes on the Cheshire side of the Mersey, the car illustrated travelling between New Brighton and Seacombe, making a junction with the ferries from Liverpool. As quickly as they can be completed, other vehicles will be put in service on the Liverpool side of the river, as will also a service of electric cabs on the Oppermann system. On the Cheshire side of the river, the routes selected cover practically the whole of the peninsula, and in addition to including the New Brighton Tower and several well-known hydropathic establishments, services will also be

formed between New Brighton and Chester, and to several favorite Dee-side resorts as well.

The constructors of this service of vehicles are the Motor Manufacturing Co., and we wish the syndicate who are controlling these services every success in their endeavour to furnish one of the most important centres in the kingdom with an adequate service of public automobile vehicles.

It was agreed at the Trades' Union Congress, on the motion of Mr. S. Fair, Dundee, seconded by Mr. R. Handy-side, Glasgow, that the Congress should urge upon its delegates the necessity of supporting the United Kingdom Union of Coachmakers in their efforts to supply qualified workmen at the trades union rate of wages in the manufacture of motor-cars or electric tram-cars.

INFORMATION has come to hand this week of the formation of two new German motor-car companies. The first is the "Centaur" Automobilbau Gesellschaft, formed in Berlin with a capital of £5,000 to construct motor-vehicles, while the other is the Allgemeine Betriebs Gesellschaft für Motorfahrzeuge, registered at Cologne with a capital of £30,000. The object of the last-named is to establish motor-car services in different parts of the country.

## Motor-Car Club's Meet.

VIEW ON THE EMBANKMENT, LOOKING WEST.

**A** BRIGHT morning inspired those who motored their way to the Thames Embankment on Saturday with hopes of a fine day and a great success for the meet of the Motor-Car Club. And if the cabmen laughed and bus-drivers jeered, what matter? For with steady constancy from start to finish the clerk of the weather smiled graciously, and the climatic conditions were most favourably inclined for the enjoyment of such a gathering. The

start from Big Ben had been announced for noon, and nearly an hour before the crowd had been assembling to criticise in a general way the vehicles that came whirling alongside the river, until they made a goodly stream, establishing the advent of the motor-car in a most unmistakable way. Mr. H. J. Lawson's Daimler brougham was one of the earliest arrivals, and faced towards Westminster, being rapidly succeeded by several of Messrs. Hewetson's Benz vehicles, in which rode many patrons of the automobile industry. Mr. R. Winn's motor-cycle attracted the attention of the curious, and the Motor Manufacturing Company had five vehicles of the English Panhard type in the display, Messrs. Gretton, Robinson, Buckea, Burgess and Richardson driving. Messrs. E. J. Coles and C. Cordingley were on an 8-h.p. Benz, Mr. E. Estcourt was on a Daimler phaeton, and Mr. Van Toll, Mr. Altree and Mr. Instone drove Daimler Co.'s vehicles. Mr. E. K. Purchase was on a Daimler phaeton, Dr. Lehweß drove a Mors car, and Mr. Frank Morriss of King's Lynn had a large party in his wagonette—the only type of vehicle for the conveyance of passengers that was present. Herr Dederich's tricycle and

trailer afforded considerable scope for the comment of the crowd, as did some of the dozen motor-cycles, including two of the Beeston Co.'s ridden by Messrs. F. Eason and L. Kennedy. Among others who motored to the Palace were Messrs. G. D. Barnes, Buttemer, S. Atkins (Koch), Frentzel, Zacharias (and Mrs. Zacharias), C. Critchley, Mackenzie, Campbell Muir, F. O. Seyd, Capeller, Wridgway, E. A. Bauer, F. F. Wellington (with 3 cars), S. F. Edge, C. Jarrott, C. H. Schofield, J. W. Riches, C. Crowdus, F. D. Butler, C. Friswell, E. H. Clift, and the Hon. C. S. Rolls on his Panhard racing car.

It would be impossible to chronicle all who were present at the Palace, nor even those who took part in the parade on the Embankment, for no sooner did the cars arrive than small groups were formed, passengers from other vehicles turning the event into quite a social gathering, all being so intermixed that anything like a complete census was impossible. And then, when at twenty minutes past twelve the procession moved off those in the fiftieth car saw nearly a score of other vehicles rushing along the Embankment to the urgent promptings of the drivers of horse-drawn vehicles and the plaudits of the spectators.

### THE JOURNEY TO THE PALACE.

A sharp turn to the left brought us on to Westminster Bridge, where we were soon in the midst of a very miscellaneous traffic, the ordinary vehicles being supplemented by the cabs and wagonettes of the thousands who were on their way to the races at Kempton Park, so that for the first twenty minutes of the journey the drivers had a fine exercise, which tested their capacity quite as keenly as the ability of

the cars to mount gradients was tried when nearer the Palace. Some of the complications that ensued were interesting. At one point an omnibus was surrounded with cars—a car in the front of it, another behind it, and one on each side—in a way that would probably have inspired the present Poet Laureate to re-echo his predecessor's famous "Charge of the Light Brigade": "Boldly they drove, and well"—right through the crowded traffic and on the splendid Kennington and Brixton roads, where the less congested state of the streets enabled many of the cars to make the pace for cable trams and the other methods of locomotion that were met with. Policemen stood idly at street corners, with a resigned expression of countenance, as though the motor-car opened up visions of other trials to be patiently borne. Horses remained equally stolid as the long line of cars—there were eighty in all that crossed over Westminster Bridge—passed on, and while some raised their heads, most of those standing at ease went on feeding, as though they recognised in the motor-car a friend and brother likely to save them many long journeys and hours of weary toil in the future. Evidently many of the dogs we met were strangers to the idea of motor locomotion on common roads, and some rushed at the rear of the vehicle, to be much surprised if it happened to emit an unfamiliar snort at that moment. One, an inquisitive collie, renewed the attack, rushing to the front of the car to find the horse; unsuccessful in the search it sullenly went to the kerb to await the next vehicle, and probably renew the investigation.

From windows and pavement we were observed by many inhabitants as we went along, but as the cars reached the Brixton Station something resembling enthusiasm prevailed, large crowds lining the pavements and overflowing into the roadway. The cabmen, forgetting the annoyance of the taximeter, condescended to grin, and, omitting to speak in their own peculiar language, were humorously polite. Further along the Brixton Road, a group of farriers, with a modern Sir John Falstaff among them, welcomed us with invitations to have the horses shod, their merry faces and well-favoured bodies wearing a prosperity that may ultimately wane as the progress of the motor-car continues. If they are wise, they will consider the changing fashion of the time and recognise that in repairing cars and sending motorists on their way renewed may be developed a business likely to vie with the farrier fraternity in its usefulness and profit. So far not a single car had been overtaken, and as we turned to go up the hill on the south side of Streatham Common half a dozen were seen ascending the stiff elevation. They bore the strain well, and, as we followed in easy style, the beautiful view added to the enjoyment of the ride. One car at the bottom, however, required coaxing, and the driver having dismounted and gone to the rear we saw him no more. But there was a suspicion that he was helping his vehicle along and putting his shoulder well to the work. Perhaps he will confess, and then his fame as an imitator of what would have been necessary in the case of a horse-drawn vehicle carrying a similar load will become noised in the motor-car world.

Quite uneventful as had been the first part of the journey, the remainder was similarly unexciting save, of course, for the novelty experienced in the quicker rate of travel with its exhilarating tendency and pleasurable sensations. Our wagonette with its eight passengers—all, save Mr. C. G. Wridgway, men of round proportions and heavy weight—traversed the whole distance with an absence of vibration and an easy running that well established its merits. On nearing the Palace a nasty bit of road was encountered—for a distance of about twenty yards it was being made up; but this caused no delay, and we reached the Crystal Palace in sixty-five minutes from the start. Considering the traffic through which, in the earlier part of the trip, the cars had to be manœuvred, the outing must be regarded as a complete justification of the motor-car—complete in every particular. In speedy transit over variously made-up roads and up stiff and long gradients the

cars did uniformly well, and while each has its own particular merits the general work of some eighty vehicles showed that the day of the motor-car has arrived.

#### STARTING THE CONTESTS.

The work of marshalling the contestants increased in difficulty with each class. It certainly proved no playful task, and had to be very seriously regarded by those responsible for bringing the cars into line for the Starter's pistol. The motor-cycles were quickly arranged in Indian file according to the order on the programme, but the motor-cars in Class C having passed the rope that divided the marshalling ground from the starting point made it necessary to identify each competitor just before starting; and the fact that the fifteen vehicles in Class D were manipulated in such a small space so that each was on the starting-line at the proper moment speaks well for the perfect control which each driver possessed over his vehicle. Everything was in admirable order, and not one false start was made, the cars all commencing their journeys with precision and ease.

The contests themselves were arranged to take place over a course of two miles, in the grounds attached to the Crystal Palace. A diagrammatic outline of this was given in our last issue. The course itself presented every feature likely to be encountered in ordinary tours. In some sections the roads were purposely made loose, and the inequalities caused by the passage of heavy wagons, incidental to the carrying out of the great improvements now in progress by the Crystal Palace Company, were in every case included in the route. The gradients encountered in the course were varied and in some cases severe, whilst ascents and descents were encountered in all parts of the main route. The starting and the finishing points were arranged on the lower main terrace, and as this was beautifully even, although somewhat dusty, the cars had a fair road for starting and concluding their runs. The course would have been an ideal one for the purpose had it not been that necessity compelled that the cars on the return journey should join the route of those on the outward journey. It was not possible to avoid this, however, for the reason that there is only one carriage road entrance on to the lower terrace. As a result it became necessary to have a "control station" or "special stop" close to the point of junction. Here the outgoing vehicles were detained until the course was clear of cars, the time of detention being taken and deducted from the recorded results of the timekeepers at the starting and judging points. In addition to this "special stop," five other stopping places were arranged at different points on the course. The contests were designated as "control competitions," and these stopping places were in some cases arranged at spots that made it a necessity that the cars should be kept well in hand. The turns in the course, too, embraced some very awkward "V" turns, the cars having practically to turn back in their own course. The conditions laid down were onerous, but certainly not impossible of fulfilment. Stopping places were defined by white flags placed exactly twenty feet apart, and the cars had to be brought completely to rest within the limits of this space without any preliminary stop and without backing. Drivers who failed to fulfil this condition were disqualified, it being essential that no part of the car should project beyond the flag posts either in a forward or rearward direction. Cars stopping at any other point of the course were disqualified, as were also those from which a passenger alighted during the continuance of the trial.

The entries received in each class were far beyond the number expected by those responsible for organizing the contests. It was imagined that entries would be restricted to members of the Club and their immediate friends, but that this was not the case is proved by the list published in our issue of last week. So numerous were the entries that in several classes members of the committee entrusted with the control of these tests refrained from starting their vehicles, in order that the programme might be brought to a conclusion in a reasonable time.

VIEW ON THE EMBANKMENT, LOOKING EAST.

The actual starters in the various classes were as follows:—

Class A, motor-tricycles assisted by pedals: No. 27, Motor Manufacturing Co.; No. 31, R. A. Bauer; No. 8, Rowland Winn; No. 17, Ernest Sinclair; No. 14, F. F. Wellington; and No. 54, C. Jarrott.

Class B, motor-tricycles unassisted by pedals: No. 33, W. Dederich; No. 49, Southern Motor-Car Co.; No. 47, A. Barker; and No. 9, F. Watson.

Class C, light motor-cars exceeding 4 cwt., and not exceeding 10 cwt. in weight: No. 42, the Daimler Motor Co.; No. 46, R. W. Buttemer; No. 3, Hewetson's, Ltd.; No. 4, Hewetson's, Ltd.; No. 68, Automobile Association, Ltd.; and No. 5, G. D. Barnes.

Class D, heavy motor-cars weighing over 10 cwt.: No. 15, Hon. C. S. Rolls; No. 67, Automobile Association, Ltd.; No. 32, C. Friswell; No. 21, F. W. Butler; No. 2, Hewetson's, Ltd.; No. 52, Harry J. Lawson; No. 31, Motor Manufacturing Co., Ltd.; No. 39, Motor Manufacturing Co., Ltd.; No. 43, Daimler Motor Co., Ltd.; No. 41, Daimler Motor Co., Ltd.; No. 22, E. K. Purchase; No. 48, Charles Parker; No. 19, F. F. Wellington; No. 7, Ernest Estcourt; No. 63, Daimler Motor Co., Ltd.; and No. 18, E. Campbell Muir.

Class E, motor delivery vans: No. 37, Motor Manufacturing Co., Ltd.; No. 44, Ormiston & Glass; and No. 13, F. F. Wellington.

There were very many disqualifications in all classes, and although several protests were lodged, and the protesting parties were permitted a second run over the course, the Marshals were able in every instance to bring sufficient evidence to prove that the disqualifications were correct. The second runs of some of the vehicles were interesting in several ways. In Class B, No. 47 was permitted a second run on a protest, but his net time at the finishing point was in excess of the "reasonable time" laid down by the Handicapping Committee for covering the course. In this case the limit time of thirteen minutes was exceeded by a few

seconds, and we are informed that, this being the case, no second award was made in this class. In Class C one vehicle was disqualified by the Marshals for not coming to a complete rest before starting off again, and one of the riders also alighted to argue the matter; therefore, this car was doubly disqualified, as it did not carry its complete load over the whole course. In this class, also, two competitors failed to bring their vehicles to the starting point at the time allotted for carrying out the tests of vehicles of this class. On lodging a complaint that they were not aware of the rule necessitating the vehicles being brought forward at the allotted time, they were both permitted to run over the course at the termination of another class. On investigation of the matter, however, we are informed that the Handicapping Committee decided that no excuse could be accepted for non-adherence to this cardinal rule of all sporting events; and reports were in addition brought forward by the Marshals which further supported the Committee in their decision to request the Judges to allot the prizes to the vehicle running in its proper turn which had been found to cover the course in the best time.

In Class D two vehicles were permitted, on protesting against previous disqualification, to run over the course a second time. On this second run one vehicle was again disqualified, and not only refused to permit the Marshals to remove the official number from the car as a mark of disqualification, but nearly ran over one of the Marshals who endeavoured to fulfil his duties. In the case of the other vehicle, the committee found that the previous disqualification was justified, so that its second run was disregarded. We are informed that in no case could this car have taken an award, as its time was much too slow as compared with many other competitors.

In Class E one vehicle lodged a protest against disqualification, and on investigation the protest was upheld.

In Class D the Crystal Palace Company offered awards for the best net times over the course, but the Handicap

Committee felt that, in view of the varying horse-power of the cars entered and the varying weight of the vehicles, as well as that of the load carried, it would be advisable to handicap the cars in this class. On consideration, however, it was thought that as the entries had been made without any notification of a handicap, it would be unfair to the competitors to make the awards on a handicap basis. The awards were therefore made on the lines laid down by the Crystal Palace Company, for whom the Handicap and Control Committee acted. The Handicap Committee, however, formed a handicap of the cars entering, and the Crystal Palace Company were so interested in the result that they decided to give an extra silver medal to the winner of the handicap.

We have been furnished with the following table shewing in detail the results in each class:—

| Class     | No. | Time at Start. | Time at Finish.    | Gross Time.         | 1st Stop Detention Time Allowance. | Handicap Allowance. | Net Time.            | Name of Entrant. | Award.       |
|-----------|-----|----------------|--------------------|---------------------|------------------------------------|---------------------|----------------------|------------------|--------------|
|           |     | h. m. h. m. s. | m. s.              | m. s.               | m. s.                              | m. s.               | m. s.                |                  |              |
| A.        | 54  | 2.44           | 2.49.26            | 5.26                | 10 $\frac{1}{2}$                   | 5.15 $\frac{1}{2}$  | Charles Jarrott      | Gold Medal       |              |
| A.        | 27  | 2.38           | 2.44.47            | 6.47                | nil                                | 6.47                | Motor Man. Co., Ltd. | Silvr. Medal     |              |
| B.        | 49  | 2.54.3         | 5.58 $\frac{1}{2}$ | 11.58 $\frac{1}{2}$ | nil                                | 11.58 $\frac{1}{2}$ | Sth. Motor-Car Co.   | Gold Medal       |              |
| C.        | 53  | 3.10           | 3.19.51            | 9.51                | 1.28 $\frac{1}{2}$                 | 8.22 $\frac{1}{2}$  | G. D. Barnes         | Gold Medal       |              |
| C.        | 33  | 3.6            | 3.14.34            | 8.34                | nil                                | 8.34                | Hewetson's, Ltd.     | Silvr. Medal     |              |
| D.        | 32  | 3.37           | 3.43.32            | 6.32                | nil                                | 6.32                | Charles Friswell     | Gold Medal       |              |
| D.        | 2   | 3.45           | 3.52.0             | 7.0                 | nil                                | 7.0                 | Hewetson's, Ltd.     | Silvr. Medal     |              |
| D.        | 21  | 3.40           | 3.48.8             | 8.8                 | nil                                | 8.8                 | F. W. Butler         |                  |              |

| E.        | 44  | 4.41           | 4.51.5             | 10.5                | nil                                | 10.5                | Ormiston & Glass     | Gold Medal       |              |
| E.        | 13  | 4.43           | 4.55.28            | 12.28               | 29 $\frac{1}{2}$                   | 11.58 $\frac{1}{2}$ | F. F. Wellington     | Silvr. Medal     |              |

The principle adopted by the Handicapping Committee in Class D was to take the highest horse-power car with the lightest tare weight and weight of load, and to place this at scratch. They next decided that the limit of the handicap should be five minutes. The weights of the cars as declared by the contestants and the weight of the load to be carried were then added together and the result divided by the horse-power. The resulting ratios were tabulated, the limit vehicle found, and the maximum allowance made thereto. As the total load propelled in relation to horse-power diminished, so the time given was reduced until the scratch vehicle was reached with the highest horse-power and the lightest total weight. From an examination of the whole of the results in Class D it appears that the handicap was a very satisfactory one.

#### THE TRACK CONTESTS.

At the conclusion of the control contests the greater number of the cars on the ground proceeded to the cycle track to view the five-miles invitation scratch race and the Edge-Wridgway match over a similar distance.

The entrants for the invitation race were as follows:—C. Jarrott, E. A. Gorton, C. G. Wridgway, Hon. C. S. Rolls, S. F. Edge, W. F. Hicks, G. Whitaker, J. W. Stocks, H. E. Zacharias (nominee), J. Buck, and Morgan Donne.

The starters were C. Jarrott, C. G. Wridgway, J. W. Stocks, and H. E. Zacharias' nominee, C. Jarrott riding a high-gear 1 $\frac{1}{2}$ -h.p. De Dion tricycle of French manufacture, C. G. Wridgway a Phœbus tricycle made by Noé Boyer and Co., of Paris, and fitted with an Aster motor, J. W. Stocks an Ariel motor tricycle, and H. E. Zacharias' nominee a Barrière motor-tricycle. A capital start was effected, Wridgway getting away first. He was, however, soon overhauled by Jarrott, who took the lead in the first turn on meeting the banking, and adhered to it throughout the contest.

The race practically settled down to a match between Jarrott and Wridgway, Stocks and Zacharias' nominee being lapped before two miles had been run, and being over a mile behind at the conclusion.

The pace of the leaders was terrific, and it soon became apparent that the English record would be pulled down very considerably. Notwithstanding constant efforts on Wridgway's part, he failed to obtain the lead, and after a really magnificent struggle, Jarrott eventually won in the record time of 8 minutes 22 $\frac{3}{5}$  seconds, Wridgway being four yards behind, easing up. This record is from a standing start, that from the flying start being 8 minutes 14 $\frac{2}{5}$  seconds. The previous best public time in England was just inside 10 minutes on the Crystal Palace track on Easter Monday last in the Wridgway and Rigal match. In a private trial, however, Wridgway accomplished the distance in 8 minutes 41 $\frac{2}{5}$  seconds. Records are claimed by Jarrott for the lap, flying quarter-mile, flying mile, and the flying and standing mile, two miles, three miles, four miles and five miles.

The following are Jarrott's times:—

| Lap. | Time.              | Time per Lap.    | Time per Mile.     |
|------|--------------------|------------------|--------------------|
|      | min. sec.          | sec.             | min. sec.          |
| 1    | 44 $\frac{4}{5}$   | 44 $\frac{4}{5}$ |                    |
| 2    | 1.16 $\frac{2}{5}$ | 31 $\frac{3}{5}$ |                    |
| 3    | 1.49 $\frac{4}{5}$ | 33 $\frac{2}{5}$ | 1.49 $\frac{1}{5}$ |
| 4    | 2.20 $\frac{1}{5}$ | 30 $\frac{2}{5}$ |                    |
| 5    | 2.53 $\frac{4}{5}$ | 33 $\frac{3}{5}$ |                    |
| 6    | 3.25               | 31 $\frac{1}{5}$ | 1.35 $\frac{1}{5}$ |
| 7    | 3.57 $\frac{1}{5}$ | 32 $\frac{1}{5}$ |                    |
| 8    | 4.30               | 32 $\frac{2}{5}$ |                    |
| 9    | 5.3 $\frac{2}{5}$  | 33 $\frac{2}{5}$ | 1.38 $\frac{2}{5}$ |
| 10   | 5.36 $\frac{1}{5}$ | 32 $\frac{4}{5}$ |                    |
| 11   | 6.10               | 33 $\frac{4}{5}$ |                    |
| 12   | 6.42 $\frac{4}{5}$ | 32 $\frac{4}{5}$ | 1.39 $\frac{2}{5}$ |
| 13   | 7.15               | 32 $\frac{1}{5}$ |                    |
| 14   | 7.49 $\frac{1}{5}$ | 34 $\frac{5}{5}$ |                    |
| 15   | 8.22 $\frac{3}{5}$ | 33 $\frac{5}{5}$ | 1.39 $\frac{1}{5}$ |

| Two Miles.         | Three Miles.       | Four Miles.        |
|--------------------|--------------------|--------------------|
| min. sec.          | min. sec.          | min. sec.          |
| 3.25               | 5.3 $\frac{2}{5}$  | 6.42 $\frac{4}{5}$ |
| 3.13 $\frac{3}{5}$ | 4.53               | 6.32 $\frac{4}{5}$ |
| 3.17 $\frac{4}{5}$ | 4.57 $\frac{3}{5}$ |                    |
| 3.19 $\frac{1}{5}$ |                    |                    |

The programme of contests was completed by the five-miles match between S. F. Edge and C. G. Wridgway. Edge rode a De Dion high-gear 1 $\frac{1}{2}$ -h.p. machine, and Wridgway the same machine as in the previous contest. Unfortunately, trouble with the quality of the petrol, and also some in regard to the sparking plug, caused Wridgway's machine to become unreliable, and although three attempts were made Wridgway only rode a short distance before he had to retire, Edge finishing alone in 8 minutes 28 seconds.

The Control Committee having the arrangements in hand and acting on behalf of the Crystal Palace Company and the Motor-Car Club were Messrs. S. F. Edge, C. Jarrott, W. Munn, A. MacCormack, P. Richardson, C. H. Schofield (*Motor-Car Journal*), B. C. Wotton, and F. F. Wellington, Mr. F. W. Bailly (hon. superintendent of the Crystal Palace cycle track and hon. secretary of the Motor-Car Club) acting as hon. secretary to the Committee of Control. The Time-keepers were Messrs. J. F. Bidlake, J. Price, J. F. Ramsay, and Morgan Donne.

The Judging was originally undertaken by Messrs. H. L. Clarke, C. Cordingley, H. H. Sturme, and H. J. Swindley,

but the two latter retired after finishing the judging of the motor-tricycle control contests, at the desire of the Control Committee. It was held that this course was advisable as these gentlemen, after agreeing to act as Judges, had on the ground announced their intention of refraining from judging the contests on the track, owing to the fear of some conflict with the N.C.U., both gentlemen being prominent members of this body. Mr. H. L. Clarke, however, stuck to his guns, although he is the chairman of the Norwich centre of the N.C.U., and the Judges' work was carried out by him in conjunction with Mr. C. Cordingley. No less than fifty members of the Motor-Car Club, as well as a considerable number of their friends, very kindly undertook the responsible and rather unpleasant duties of Marshals of the Course.

The full times are as under :—

| Lap. | Time.              | Time per Lap.    | Time per Mile.     |
|------|--------------------|------------------|--------------------|
|      | min. sec.          | sec.             | min. sec.          |
| 1    | 44                 | 44               |                    |
| 2    | 1.15 $\frac{1}{2}$ | 31 $\frac{1}{2}$ |                    |
| 3    | 1.49               | 33 $\frac{1}{2}$ | 1.49               |
| 4    | 2.20               | 31               |                    |
| 5    | 2.53               | 33               |                    |
| 6    | 3.27 $\frac{2}{5}$ | 34 $\frac{2}{5}$ | 1.38 $\frac{2}{5}$ |
| 7    | 4.0                | 32 $\frac{3}{5}$ |                    |
| 8    | 4.35 $\frac{4}{5}$ | 35 $\frac{4}{5}$ |                    |
| 9    | 5.6 $\frac{3}{5}$  | 30 $\frac{4}{5}$ | 1.39 $\frac{1}{5}$ |
| 10   | 5.39 $\frac{4}{5}$ | 33 $\frac{1}{5}$ |                    |
| 11   | 6.12 $\frac{1}{5}$ | 32 $\frac{2}{5}$ |                    |
| 12   | 6.46 $\frac{3}{5}$ | 34 $\frac{2}{5}$ | 1.40               |
| 13   | 7.20               | 33 $\frac{2}{5}$ |                    |
| 14   | 7.54 $\frac{1}{5}$ | 34 $\frac{1}{5}$ |                    |
| 15   | 8.28               | 33 $\frac{3}{5}$ | 1.41 $\frac{2}{5}$ |

| Two Miles.         | Three Miles.       | Four Miles.        |
|--------------------|--------------------|--------------------|
| min. sec.          | min. sec.          | min. sec.          |
| 3.27 $\frac{2}{5}$ | 5.6 $\frac{3}{5}$  | 6.46 $\frac{3}{5}$ |
| 3.17 $\frac{3}{5}$ | 4.57 $\frac{3}{5}$ | 6.39               |
| 3.19 $\frac{1}{5}$ | 5.0 $\frac{3}{5}$  |                    |
| 3.21 $\frac{2}{5}$ |                    |                    |

In the evening an "informal" dinner was held, about eighty being present.

This, the first undertaking tackled by the Motor-Car Club since its reorganization, was undoubtedly a great success, although several points in connection with the arrangements made might have been very considerably improved. Mr. Baily informs us, however, that the gathering so far exceeded the Club's expectations that they were in a measure unprepared. In further extenuation of certain small shortcomings, it must be mentioned, too, that no such meeting as took place on Saturday last had ever been held before in this country. The Club, therefore, had nothing to guide them in regard to making the required arrangements, and bearing this in mind, as well as the fact that the undertaking was under a divided control, we think the Club is to be congratulated in having attained, on its first attempt, such a creditable success. The Marshals in charge of the parade on the Embankment inform us that eighty-three cars left there for the journey to the Crystal Palace, whilst the Sydenham authorities state that 153 motor-vehicles of all types entered the Palace grounds on Saturday last. This, therefore, holds the record as the largest meet yet held in England.

THE Glasgow Corporation have entrusted the terribly named "Mo-Car Syndicate" with an order for an electrical vehicle for use in collecting the city refuse. The cost is to be £532.

## SCOTTISH NOTES.

—8—

### A Saturday Outing.

DURING the brilliant weather of the past few days Scottish motorists have been enjoying their machines to the full. Several days in succession there has been no rain, and the sun has been shining in a cloudless sky, and many delightful excursions have been undertaken. One took place on Saturday last, and a correspondent who was fortunate to be one of the party has sent me the following report of the trip, and Mr. John E. Naismith, of Hamilton, has forwarded me a few photographs taken *en route*: "On Saturday afternoon a number of Scottish motorists met in Hamilton (the home of the Scottish motor industry) and drove off in company for a run up the beautiful Clyde Valley. The "horseless procession" created no little interest and stir as it passed through the ancient town in the direction of the well-known Lanark road, a road famous to automobilists on account of its ups and downs (with no particularly stiff ascent except Kirkfieldbank brae) and to tourists for its charming scenery,

A SCOTTISH MOTOR-CAR MEET.

the nature of which has won for it the suggestive appellation of the "orchard of Scotland." Seven vehicles took part in the run—four Stirling-Daimler wagonettes, a Daimler dog-cart, a Benz sociable, and a Beeston tricycle. The carriages, which in most cases were driven by the owners themselves, looked particularly well on starting, though the dust which lay thick on the otherwise splendid roads was soon flying in all directions, and obscured the high finish of the cars, as also in several cases the optical organs of some of the passengers. Up hill and down dale on the delightfully undulating road the procession "hummed" merrily on, with here a peep of the silver Clyde as its threaded its way to its noble Firth, and there a glimpse of blossom-laden fruit trees, the pears gleaming snow-white and the apples blushing rosy-pink in the shimmering sun. Mr. John Stirling, who was astride his motor-tricycle, acted as guide, philosopher, and friend to the party—one moment forging rapidly ahead and overtaking the fast cars, and at another retracing his ground to see that no stragglers were in difficulties. At Garrion Bridge, a charming little spot on the Clyde, a halt was called, and the photograph fiend let fly at the inoffensive motorists. We seized the fiend's camera, with the result as herewith submitted. A start was soon made, and once more the procession was in full swing. Some mild racing was indulged in, various cars in turn forging to the front, the *chauffeurs* cleverest in the manipulation of their speed levers being usually the winners. The sleepy little village of Crossford was aroused from its lethargic condition by the sudden appearance in its midst of seven motor-cars, which 'midst the warning "tootle" of the sweet (?) sounding horn were suddenly "drawn up" in front of the Tillietudlem

Hotel. Here refreshments were served, and after a stay of about an hour the cars were faced homewards again. A run of some four miles brought the party to Mauldslee Castle (the residence of Lord Newlands), where the party were again photographed by the ever-present photographic fiend, whose camera was again annexed, with the result that No. 2 of our illustrations was furnished. No time was lost in getting under way again. The little Benz car ran a good horse, to use a sporting expression perhaps not applicable to automobilism, but the 'motor vocabulary' is limited. Beyond frightening a few horses in a mild degree there were no untoward incidents. Some horses appeared to shy at motor-cars on principle, for one was noticed 'kicking' at the motors which were quite stationary in front of the hotel. The return home through the busy streets of the town in the evening

A SCOTTISH MOTOR-CAR MEET.

was again a source of interest to the onlookers, although it stands to reason that in a motor-manufacturing town like Hamilton they are much more common objects than in the country districts. The outing was a great success in every way, the cars all running splendidly. The smoothness of their running may be taken for granted when I mention that an infant of some ten months took part in the drive." From the above description it is evident that the outing was much enjoyed by all who took part in it. From the photographs I observed the faces of more than one gentleman well known in the Scottish motor-car world. My correspondent informs me that it is intended to repeat the outing on Saturday, and I am promised reports of same, with some snap shots, in due course.

"BROWN HEATHER."

A SPANISH correspondent informs us that El Sindicato Fundador de la Industria de Automobiles en España, of Madrid, has just imported a Columbia electrical vehicle from America. This is said to be the first electrical motor-vehicle in the Spanish capital.

ONE of the principal features of next month's electrical show in Madison Square Garden, New York, will be the display of electric vehicles. The Pope Manufacturing Company of Hartford, Conn., the Riker Electric Motor Company of Brooklyn, and the Woods Moto-Vehicle Company and the American Electric Vehicle Company of Chicago, have all secured spaces in the central part of the hall.

AT a meeting of the Council of the Liverpool Self-Propelled Traffic Association held on the 1st inst., the following were appointed a sub-committee to conclude the arrangements for the forthcoming Trials of Motor-Vehicles for Heavy Traffic, viz.: Messrs. J. A. Brodie, M.Inst.C.E., S. B. Cottrell, M.Inst.C.E., Dr. H. S. Hele-Shaw, M.Inst.C.E., Henry H. West, M.Inst.C.E., J. Walwyn White, Hon. Tres., and E. Shrapnell Smith, Hon. Sec.

## CORRESPONDENCE.

### PENNINGTON v. MORS CHALLENGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As we are, and have been, most anxious that this contest should come off, we wired the Automobile Association early last week, asking them what day would suit their convenience to meet us at Shapfell and run off the race. Two days afterwards we received a letter stating that our telegram was "entirely incomprehensible." On May 6th we wrote them a letter, of which the enclosed is a copy (which please publish), and we have not since received any reply.

We leave the public to draw their own conclusions; but clearly, if the contest does not come off it is from no lack of willingness on our part to bring the matter to a conclusion.

London, Yours faithfully,  
May 9th, 1899. PENNINGTON & BAINES.

(Copy of Letter from Messrs. PENNINGTON & BAINES TO THE AUTOMOBILE ASSOCIATION, LIMITED.)

GENTLEMEN,—In last week's issue of the *Motor-Car Journal* we accepted your proposition, namely, to run a race against your "Mors" car (which can have either two, four, or any other number of cylinders and any number of horse-power) up Shapfell twenty-five times. In all these matters of challenges, as acknowledged by your Mr. Atkins when here, your challenge was not meant for us, but for the Daimler Company, and, as Mr. Atkins stated, you were surprised that we accepted; but, nevertheless, we did accept each and every challenge issued by your company, the Automobile Association; and when our cars were in Manchester we tried in every way known to us to get up an impromptu race here quietly, and, as stated before, there was always something the matter: either the tire had burst, the electric current was defective, or some part had not arrived from France to replace a broken one, and so on. Anyhow, from one excuse or another, we were never able to get you out on the road to run off a friendly contest. We expected with each mail to receive a letter stating that you would meet us on a certain day at Shapfell. We noticed that you had made your challenge for thirty days, and we did not wish to give you an opportunity to crawl out. Having no such letter we telegraphed as follows:—

"Since we have accepted your proposition have heard nothing from you. We are ready at any time. What day will suit you to meet us at Shapfell for the race?—PENNINGTON."

We regret that in these days of intelligence such a telegram is "entirely incomprehensible." We wish to say further that this is the second letter we have had from you, and in both letters the only prominent character was the word "incomprehensible." It seems strange that you cannot comprehend so clear and straightforward a telegram as the one given above; and we wish to call your attention to the fact that we hold ourselves in readiness to meet you at Shapfell with any type of car (from your four-cylinder up to your 16-h.p. racing-car) you may wish to enter against us for the race up this hill twenty-five times against our double-cylinder car, each car to carry two people. We wish to tell you that we are doing our business with our customers on business lines, and never have we in any case cried down the ability of the "Mors" car or any other car. On the other hand, we have statements in writing to show that you have devoted much time and energy in crying down our make of car; and we wish to point out, and are willing to prove, that we have sold fifty cars where you have sold one "Mors." And why? Because we devote our full time to telling the qualities of our own car, and not running down the quality of any other.

Yours faithfully,  
PENNINGTON & BAINES.

P.S.—We await your telegram saying when you can meet us at Shapfell.—P. & B.

### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are much obliged to you for informing us of the contents of Messrs. Pennington & Baines' letter. On May 9th we replied to these gentlemen as follows:—

"We are in receipt of your letter of the 6th inst. We have made our position quite clear in our letters published on the 14th ult. and 6th inst., and we now note with pleasure that you are willing to adopt our propositions made therein. To come to as speedy a termination of the contest as possible, we believe the best means is the carrying out of the suggestion made by the Editor on page 129 of *The Motor-Car Journal*. We have written to the latter to this effect, and trusting that you are of our opinion,

"We are, yours faithfully,  
"THE AUTOMOBILE ASSOCIATION, LTD."

As you will see by this we have done everything to ensure the speedy coming off of the contest and refrained from replying to the many other points which Messrs. Pennington & Baines have seen fit to raise, and which are as

untrue as they have little to do with the challenge. Lastly, we should like to express our surprise at the extraordinary postal arrangements which prevented Messrs. Pennington and Baines from getting on the 10th our letter posted here on the 9th inst.

Yours faithfully,  
May 11th, 1899. THE AUTOMOBILE ASSOCIATION, LTD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your suggestion on page 129 of your valuable paper, we think the same a very good one indeed, and shall be only too pleased thus to end this paper feud. We are sorry that we had to ask to so often intrude on your valuable space, which was very much to our dislike, as we are business people, and old-fashioned enough to believe that "the only proof of the pudding is in the eating" and not in the talking about it.

Yours faithfully,  
THE AUTOMOBILE ASSOCIATION, LTD.  
Prince's Road, Holland Park Avenue,  
London, W., May 9th, 1899.

### EFFECT OF "JARRING" ON RIDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I have space to reply to those correspondents who have taken the trouble to note my former letter on "Jarring"? The letters of Messrs. Rollason and "Petrol" confirm my complaint that some better system of seating is required on a motor-tricycle than an ordinary saddle. I have tried one of the Automobile Association seats as pictured in your last issue, but do not like them any better than, even if as well as, a good saddle. I have been designing a special padded seat which I am getting made, and when I have tried it I will give my experience of it.

Mr. Blyde recommends pneumatic saddles. I have tried these, and consider them the most uncomfortable saddles made—they seem to get so hot and ride dead.

Mr. Edge puts me down as a novice suffering from the natural stiffness of a first ride. I may say that I have been riding motor-tricycles now for two years and a half, have covered many thousands of miles, and often run eighty miles in the day. I should be fairly well seasoned by now, and yet, as I said before, a fast ride on a lumpy road seems to have more effect on the spine than 100 or 150 miles' ride on an ordinary bicycle.

Yours truly,  
Bradford, May 8th, 1899. JAS. EDW. TUKE.

### THE WORKING OF BENZ CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In accordance with my promise last week, I hasten to give your readers the result of a further trial of the new Benz cars. I went up to London on Saturday evening and made arrangements to leave on Sunday morning with a new No. 2 "Ideal." I was so confident that she would turn out all right that I did not even start the motor until the car was in the street ready to start for Birmingham.

I may say that I had with me a gentleman anxious to experience a long run, and we were accompanied some distance by a friend with his two-speed "Ideal," weighing some 2½ cwt. lighter than my car.

We left Messrs. Hewetson's premises at 10.30 a.m., and reached Barnet about 12.0. After "oiling" we started for St. Albans (ten miles), and reached there at 12.55, twelve minutes before the lighter car; leaving again at 1.20, we ran to Dunstable (2.20), making a long stop there, just outside the town, as our companion had to return to London.

At 4 p.m. we started again, my friend returning to London (have since heard that he reached Oxford Street at 6.30 without a stop) while we went on to Stony Stratford, where we had tea. At 5.25 we started again, and our next stop was Coventry (thirty-nine miles), which was reached at 8.50.

We took in water here, and, leaving at 9.10, we arrived at Birmingham at 10.15, after a most enjoyable day.

Now, as regards "little adjustments," I can only repeat what I said last week. Not a tool of any kind (except oil can) was touched the whole way, and upon inspection at home I found everything all right—not a nut or bolt loose. Of course, I used the oil can at every stop and felt the bearings over, but found nothing get warm. Our average was about fifteen miles per hour. The roads were good, though we had a stiff head-wind most of the way and plenty of dust. My "passenger" was delighted, and there is now one more proud owner of a Benz car.

Acocks Green, Birmingham, Yours faithfully,  
May 9th, 1899. A. J. ALDRED.

### THE JUDGING AT THE MOTOR-CAR MEET.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In case there should be the slightest misunderstanding in regard to my Committee's action in reference to their relieving Messrs. Sturmev and Swindley of their duties as judges on Saturday last on the occasion of the motor-car meet at the Crystal Palace, I would like, for the benefit of your readers, to fully explain the Club's position in this matter.

On April 19th we received a letter from the Secretary of the National Cyclists' Union (London centre) saying that anybody taking part in our competitions must hold a N.C.U. amateur or professional cyclist's licence, and, further, that unless this was the case no Union official would be permitted to act without suffering punishment.

We at once communicated this to the Press, together with a copy of the letter of protest which we addressed to the N.C.U.

In the face of this, four gentlemen, namely, Messrs. Clark, Cordingley, Sturmev, and Swindley, were kind enough to act as judges at our meet, although fully realising that according to this N.C.U. they ran the risk of suffering some terrible punishment.

At the last moment, however (even so late as after judging the motor-tricycle control time contest), Messrs. Sturmev and Swindley became frightened, and expressed their intention of not judging some of the competitions set down for decision.

As the Committee could not understand why these gentlemen should wish to withdraw from a portion of the duties accepted by them, they, of course, at once relieved them from any further responsibility, and the judges' work and duties were carried out by Mr. H. L. Clark (chairman of the Norwich centre of the N.C.U.) and Mr. Charles Cordingley.

My Committee would like it clearly understood that they have no ill-feeling in the matter so far as Messrs. Sturmev and Swindley are concerned, as they recognise that these gentlemen acted in perfectly good faith from their own point of view; but at the same time the Club maintains emphatically that automobilists shall not be governed by or interfered with in any way except by a properly constituted body formed from their own ranks. They feel that gentlemen acting in any capacity in relation to motor-car contests must be prepared to act entirely from an automobilist's point of view, and not throw in their lot with nor support the views of this cycling body who are desirous of taking under their control a new form of sport. There is no doubt that motor-vehicle contests are rapidly displacing cycle racing—at any rate, amongst those who wish to participate in a sport which, at the present time at any rate, is entirely confined to amateurs, and is free from that class of competitors which the N.C.U. appears to spend its life in trying to eradicate with such poor success.

Of course, the public can appreciate quite well that it is possible for a person to be a professional cyclist or runner without his becoming *ipse facto* a professional in automobilism, yachting, driving or shooting. Yours truly,  
May 10th, 1899. F. W. BAILY, Hon. Sec.

# Leaders in Mechanical Road Locomotion.

## IV.—MONSIEUR LEON SERPOLLET.

CONTINUING our series of illustrated biographical sketches of those who are entitled to be termed leaders in the revivification of the movement for providing motor-vehicles for mechanical road locomotion, we give this week a portrait and a few biographical details of Monsieur Leon Serpollet, one of the most indefatigable of the many workers in this complicated section of mechanical engineering. Mon-

sieur Serpollet is no new adherent to the automobile movement. From his youngest days the problems connected with it have exercised a charm over him that, fortunately for the industry, he has ever found it impossible to destroy. His furnaces and boilers for motor-vehicles on rails have, of course, a world-wide reputation, but although applied in the first instance to vehicles on rails, the research resulting in their production was primarily undertaken with a view of providing satisfactory boilers, etc., for vehicles travelling on the ordinary road surface. These investigations were commenced when the subject of this sketch was 18 years of age, and it was at this period that he commenced to construct in his father's workshops the first of those pieces of apparatus which have led him to become a master in the problems connected with the construction of steam motor-vehicles and the provision of a boiler which should have enormous power and yet be under perfect control.

It was not until 1888, however, that his first steam road vehicle was constructed, and in that period it may be confidently averred that no day was passed without his spending some portion of it in the endeavour to perfect his system and master the difficult problems presented. We do not seek to convey that this labour was incessant, for numerous other problems claimed his attention. He even afforded relief to himself by writing poetry; but no problems undertaken had ever such an attraction for him as mechanical road locomotion. Although his attention was withdrawn from this subject occasionally, either by claims of business or by mere force of will, yet he always returned to his first love, and grudged no labour in becoming intimately acquainted with its many phases.

Everyone who has had the pleasure of being on terms of acquaintance with Leon Serpollet will acknowledge that his temperament is an ideal one for such labours as he has undertaken. His enthusiasm for steam as a motive power is only

equalled by his enthusiasm in motor road locomotion generally. In temperament equable, persevering, and undespairing, no difficulties encountered have been sufficient to shake his determination to conquer or to dissipate his enthusiasm. Never boasting, and always open to appraise true criticism at its proper value, the results of his labours have always been advances. Those things which experience or criticism have proved to be undesirable he has willingly sacrificed, with due acknowledgments to the critic; but, no matter how severely just the criticism, he has never despaired and never lost heart or temper, applying himself with diligence to a search for some method of disarming the critics.

Those who examine the results of his labours from his earliest days to the present moment must perforce acknowledge that there has been no backward step; every change has been towards advancement, and every variation of an original conception an improvement. Monsieur Serpollet is no believer in, or worker by, "guesswork," everything he does is founded on a close study of scientific and mechanical laws; he is never hasty, but always calm and deliberate; full of energy, but never a chaser of "will-o'-the-wisps."

His researches in connection with the utilisation of the best fuels for automobile vehicles has led him in turn to adopt coal, coke, anthracite, and at last liquid fuel or petroleum. His labours to find a satisfactory burner for liquid fuel have been immense; but, as is now well known, he considers that the last two years' study have brought him to finality—for the present, at least. His burner is now silent, ensures a perfect combustion of the oils, or rather their gases, and is, moreover, under such perfect control that automatically, on the demand arising, his "fires" are increased synchronously with the provision of additional water for evaporation. He is, of course, a

rigid believer in the use of super-heated steam for automobile vehicles, and no one could discuss this matter with him without becoming convinced of the truth of his arguments and of the immense and exact knowledge which he brought to bear in discovering a satisfactory means of generating, controlling and utilising it.

By his steadiness of application, by the thoroughness of his work, and by his intimate knowledge of the intricacies involved, Monsieur Leon Serpollet has the right of being placed amongst the pioneers in the automobile movement. It was to him that the first licence was granted for driving an automobile through the streets of Paris; this was in 1888. Apart, then, from his labours, he has a right to be included in the illustrious group containing Gottlieb Daimler, Emile

MONSIEUR LEON SERPOLLET.

Léonard, Count de Dion, and Armand Peugeot, whose works have so considerably contributed to the success of the horseless vehicle of the present day.

His peregrinations through the Paris streets in 1888, and his subsequent journeys with his friend Monsieur Archdeacon from Paris to Lyons and Lille in his then certainly roughly-constructed and crude vehicles, are a matter of history. But in the light of present improvements such journeys must be regarded as being mere "promenades," and from confidential information afforded us, which we are at present unable to publish, we are convinced that the Leon Serpollet vehicles to be exhibited at the forthcoming Exhibition in Paris will demonstrate most fully that all the difficulties previously encountered in constructing a small steam pleasure carriage have been overcome, and that they will mark a new advance in the solution of the problems connected with automobile locomotion.

As we have stated, Monsieur Serpollet holds that for the present at least his researches are finished. His recent improvements have brought his vehicles to a point where success is certain and assured, and we tender our best wishes (which we know will be re-echoed by all automobilists) to Monsieur Leon Serpollet, and his financial supporter, Mr. Gardner, who have each in their respective spheres rendered it possible for an automobilist to possess a thoroughly satisfactory steam motor-vehicle.

## MOTOR-CARS ON THE CONTINENT.

### The Paris-Bordeaux Race.

THE route taken for this race, in which it is anticipated that several English riders will take part, is via Paris, Versailles, Chartres, Cheateaudun, Vendome, Tours, Châtellerault, Poitiers, Ruffec, Angoulême, Barbezieux and Bordeaux. The total distance is 565 kilometres. As already announced, an exhibition of the vehicles taking part in this and the two other events down for decision at this period will take place in the Quinconces Square.

### The Turin Race.

THE Turin-Pignerol-Turin contests were run off in most glorious weather. Of the huge number of entries no less than forty-eight signed the control book and faced the starter. The results were as follows: Class 1—Two-seated carriages: 1st, Gras, in 1 h. 59 m. 20 s.; 2nd, Chauchard, 2 h. 2 m. 37 s. Class 2—Four-seated carriages: 1st, Gondouin, 2 h. 26 m. 12 s.; 2nd, Clerissy; 3rd, Le Tainturier. Class 3—Motor-tricycles: 1st, Bugatti, in 1 h. 39 m. 7 s. Several competitors had to give up owing to accidents, but these were not of a very serious character. The exhibition which followed the contest was well attended, and appeared to create very considerable interest.

### Motor-Vehicles in the Haute-Loire District.

THE Compagnie Lyonnaise, which devotes itself entirely to providing public motor-vehicle services, has received the consent of the authorities to set up steam vehicle services on the following routes, namely: From Puy to Fay-le-Froid, from Puy to Monastier, from Puy to Saugues, and from Puy to Langogne. We are also informed that additional routes are now under consideration as follows: From Mendez to Langogne (Lozère), from Mendes to Florac (Lozère), from Florac-Sainte-Cécile in connection with the P.L.M. Railway, and from Tay-Le Cheylard (Ardèche). The Company is a very energetic one, and in addition to establishing the services above mentioned it is proposed to undertake others in adjoining districts so soon as the necessary vehicles can be procured. The Scotte road train is employed in all the Company's services, and as the districts in the sections selected are very poorly provided with means of inter-communication, those who are in a position to judge hold that the services will be well patronised and become commercially successful.

### The Paris Automobile Betting Luncheon.

THE Parisian automobilist is always on the look-out for new means of providing that excitement upon which the French appear to thrive so well. The latest institution is the Betting Breakfast or Luncheon. At this the members assemble, and as the spirit moves them make more or less rash bets. In the past, dirigible balloons have been matched to alight on the terrace of the club house of the Automobile Club. Various other apparently ridiculous challenges have been laid down, and have found ready acceptors, in the majority of cases the stakes taking the form of champagne luncheons. Last week further progress was made in these somewhat braggart and foolish schemes. A Monsieur Noel bet that the kilomètre record of Count de Chasseloup-Laubat (38½ seconds) will be beaten before the end of the present year by a carriage actuated by a petroleum-spirit motor. The bet was accepted by Monsieur Thévin, who apparently does not possess so great a faith in the coming capabilities of petroleum motor-vehicles as the proposer of the bet. Another of these series of events was that Monsieur Santos-Dumont contended that in the dirigible balloon contest the smallest balloon will travel farther than the largest ones. Monsieur Monnier accepted the bet, holding a contrary opinion.

### The Races at the Parc des Princes.

THIS race, which was held on Sunday week last, embraced a contest for motor-cycles over a distance of 20 kilometres. This contest, although open to motor-bicycles and motor-tricycles, was, as a fact, restricted almost entirely to motor-tricycles, only one Bollée voiturette being entered. At the start, Giraud on his Bollée gained 50 metres start, but by dint of pedalling the tricycles were enabled to pass it very soon, and the voiturette was left 100 metres behind the other competitors. The Bollée, unluckily, made a violent lurch at a sharp turn and was thus put out of the race, the steering device being strained. Then the tricycles only remained on the track. Rivière, who drove a motor-tricycle fitted with a twin-cylinder engine, was at first rather slow in starting, and ultimately nearly suffered a spill. The contest was thus reduced to a match between Vasseur and Beconnais, who from the beginning followed each other very closely. Beconnais tried again and again to pass, but Vasseur resisted, and the two runners finished as they started. During that time Rivière, who had started again, passed Girardot and reached the third position. The results were as follows:—First, Vasseur, in 21 min.; second, Beconnais, a wheel's length behind; third, Rivière, 1½ wheel behind; fourth, Girardot, 2½ wheels behind. The one hour contest with self-propelled cycles proved once more the insufficiency of the power fitted to the petroleum tandems, their working being far too irregular for trials of this kind. Out of a dozen tandems only three or four worked well, the others having frequent breakdowns and making a deafening noise. After the meeting, M. René de Knyff with a four-seated carriage, and Giraud with a two-seated one, went down on the track and drove for about ten minutes. It is quite certain that if the track were wider, one could organise carriage contests thereon. At any rate this trial shows the possibility of an automobilodrome, but unless the speed was unnecessarily high we should not care to drive a motor-carriage on a banked track.

### Rallie-Papiers of the "Vie au Grand Air."

OUR contemporary, the *Vie au Grand Air* has organised for decision on May 21st an automobile paper-chase competition open to the members of the A.C.F., T.C.F., and to the subscribers and guests of our contemporary. There will be three classes; A, carriages; B, motor-cycles; and C, carriages driven by a lady. The course will be about thirty kilometres.

**Draguignan Race.**

ON May 21st the Draguignan, Traves, les Arcs, Vidauban, Lorgues, Draguignan race will take place. Two classes are comprised in the contest—carriages and motor-cycles (under 200 kilos.). An obligatory display will be held on May 22nd on the boulevard Bernard-Trans.

**Motocyclettes Criterium.**

OUR contemporary, *Le Vélo*, is organizing, under this heading, for July 11th next a 100-kilometres contest, restricted to motor-bicycles weighing under 50 kilos. in driving order. The voiturette contest inaugurated by the same paper for vehicles of the small carriage type weighing under 300 kilos. will be run on June 6th.

**The Tour de France.**

OUR contemporary, *Le Matin*, has just published the route to be followed in the competition which it has organized. It is as follows: First day, July 16th—Paris, Fère-Champenoise, Saint-Dizier, Toul, Nancy, about 300 kilometres; start from Champigny at 8 a.m. Second day, July 17th—Nancy, Langres, Gray, Dôle, Lons-le-Saunier, Bourg, Amberieu, Culoz, Aix-les-Bains, about 450 kilometres; start from Nancy at 5 a.m. Third day, July 18th—Rest. Fourth day, July 19th—Aix-les-Bains, Chambéry, Grenoble, Romans, Tournon, St. Etienne, Roanne, La Palisse, Vichy, about 400 kilometres; start from Aix-les-Bains at 5 a.m. Fifth day, July 20th—Rest. Sixth day, July 21st—Vichy, Clermont-Ferrand, Ussel, Tulle, Brive, Périgueux, about 300 kilometres; start from Vichy at 6 a.m. Seventh day, July 22nd—Périgueux, Ruffec, Bressuire, Nantes, about 350 kilometres; start from Périgueux at 6 a.m. Eighth day, July 23rd—Nantes, Angers, Le Mans, Alençon, Argentan, Falaise, Caen, Cabourg, about 350 kilometres; start from Nantes at 6 a.m. Ninth day, July 24th—Cabourg, Lisieux, Evreux, Saint-Germain, about 200 kilometres; start from Cabourg at 10 a.m. The whole distance is about 2,350 kilometres, and twenty-four Departments are passed through in the tour. None of the roads that we have mapped out, says *Le Matin*, except the part included between Lisieux and Saint-Germain, have yet been the scene of automobile contests. Nancy in the east, Clermont-Ferrand in the middle, Nantes in the west of France, are important centres interesting to visit, and at which the contestants will be joyfully received. In a few days the itinerary in all its details will be published, and the exact topography. Some of the roads announced are very well known, and there are veritable race-tracks on some of them on which the highest speeds can be realised without any danger. The greater part of the western itinerary, all the distance from Périgueux to Paris, is, we are told, also over very fine roads.

**LONDON ELECTRICAL CAB COMPANY.**

MR. JUSTICE BYRNE had before him an application in the matter of this Company for relief under the Companies Act of 1898 in respect of certain fully paid-up shares. The vendors of the patent rights under which the Company worked agreed to sell the patents, to be paid in cash or shares. The vendors had received a certain amount in cash from two issues of shares, and in 1898 they agreed to take the balance (some £24,000) in fully paid shares. These were allotted, but no sufficient contract had been filed, and the applicants, the holders of shares, have asked that a memorandum in writing might be filed with the Registrar of Joint Stock Companies. Mr. Justice Byrne directed the filing of a memorandum in a form to be approved in chambers, and directed that on its being filed it should operate as a sufficient contract.

EIGHT hundred and thirty-two motor-car drivers have presented themselves to the Paris police for licences during the past five months. This number includes one hundred cabdrivers.

**SOME NEW WATER - CIRCULATING PUMPS FOR PETROLEUM-SPIRIT MOTOR-CARS.**

IN order to keep up a rapid circulation of cooling water to the cylinders of petroleum-spirit motors a pump of some description appears to be an absolute necessity, troublesome though some of these attachments have proved. Several new types of pumps, said to be specially suitable for application to motor-vehicles owing to their simplicity and relative small size, have recently made their appearance on the market. Among these is the "Abeille" centrifugal pump shown in Fig. 1, lately introduced by Messrs. Dalifol and Thomas, of 183 bis Faubourg Saint-Honoré, Paris. As will be seen, it comprises but few parts. On the shaft is a disc *D*, provided with projecting vanes. The shaft and disc are rotated by means of the small pulley driven by the motor, either by means of a strap or by frictional contact with the

FIG. 1.—PUMPS.

fly-wheel. The principal claim made for the "Abeille" pump is the facility with which it can be taken apart without interfering with the connections of either the inlet or outlet pipes *A B*. To remove the cover *C* with the disc *D* and shaft from the body of the pump it is only necessary to unscrew four bolts.

FIG. 2 AND 3.—PUMPS.

Another improved rotary pump has lately been devised by M. Julien and made by M. G. Benoit, 119 Rue St. Maur, Paris. It is illustrated herewith by the two sectional views, Figs. 2 and 3. The piston forms the essential feature of the new pump; it comprises a short screw *b*, on which the thread or direction of one half is contrary to that of the other half. The screw is mounted on the rotating shaft *e*, which runs in suitable bronze bearings. The screw is cast in one piece with a circular wall *g* which divides the cylinder into two portions, each part having communication with the admission and outlet pipes *b c*. Extending through the cylinder walls on each side of the dividing wall *g* are two special flat-faced bolts *i*, the use of which is to prevent the rotation of the water at that portion of the cylinder. When the pump is put in operation the heated water is drawn in from the walls of the cylinder of the motor, and driven towards the centre of the pump cylinder, at a pressure proportional to the speed of the rotation of the pump. When the water meets the dividing wall *g* its direction is diverted, and meeting the pieces *i* it is

caused to pass upwards through the outlet pipe *c*. The pump can also be run in the reverse direction, and employed in maintaining a supply of cold water to the water jacket of the motor. It will also, it is claimed, work equally well with heated water, even up to a temperature exceeding 100° C. At a speed of from 2,000 to 2,400 revolutions per minutes, and a difference in height of 3½ ft., a pump with a 60-mm. diameter cylinder will, it is stated, circulate from 500 to 600 litres of water per hour. The pump only weighs about 8½ lb., and by the use of aluminium in certain of the parts M. Julien hopes to reduce the weight to less than 4½ lb.

## PETROLEUM MOTOR-VEHICLES.\*

By JAMES D. ROOTS, A.M.I.M.E.

(Continued from p. 144.)

Fig. 6 is a sectional elevation of the Butler tricycle, which was made in this country, but which, from all the author can gather, was not a very successful attempt to apply a motor to a tricycle. Its inventor, however, displayed much ingenuity and perseverance in his endeavours to solve the problem of light road locomotion, and he certainly deserved to have been more successful. His patent for this motor-tricycle is No. 15,598, November 15th, 1887.

FIG. 6.

A is one of the motors, for two were fitted to the tricycle, B the piston, C a guide, D a connecting rod conveying the power directly to the crank E, attached to the axle of the rear driving wheel. The other motor was fitted and connected to a similar crank on the other side of the rear driver. The two front wheels were steerers, and were connected together in a somewhat similar way to the Ackerman steering arrangement. F is the rear driving spindle of the back wheel G. H is a chamber, packed with wire gauze to prevent back fires, in which the explosive mixture was stored under pressure, an arrangement that under certain circumstances might become dangerous. I is a rotary admission and emission valve for the front end or pump end of the cylinder A, the piston rod of which worked through a gland. In the front end of the cylinder the piston B, through the rotary valve I, drew in its charge of mixed air and petroleum spirit and delivered it under pressure through the same valve to the pressure chamber H. When the rotary valve J, which is the distributing valve for the combustion end of the cylinder, was in the correct set position, the charge under pressure flowed into the combustion end of the cylinder from the chamber H, until the piston had travelled one-fifth of its stroke. The rotary valve J was then closed, and the charge was fired by an electric spark at the terminals K. The carburettor does not appear in this view. L is a chamber in which the air to be used in the cylinder was heated by the exhaust products. M is the spirit tank, N the water tank. Z is a roller intended

to serve as a brake, and to lift the back of the tricycle from the ground to start it.

There was an explosion impulse only at every alternate stroke, and this impulse was very seriously affected as to efficiency by the fact that the charge was fired only after one-fifth of the stroke had been completed. The effect of this would be to reduce the power of the motor in comparison with the ordinary De Rochas cycle by considerably more than one-fifth. Many other losses affecting the general efficiency would follow from this arrangement, but no doubt it was essential at that time to make some considerable departure from the Otto construction, as the patent for that engine was still in force.

All the vehicles hitherto considered used petroleum spirit as their fuel for propelling purposes, the vapour of which, mixed with its due proportion of air, was exploded either by an electric spark or by a hot tube in the motor cylinder. Up to the year 1892 no attempt had been made, so far as the author is aware (at all events he has not found any record of any such attempt in the Patent Office), to make a petroleum motor-vehicle of any kind to work with petroleum oil instead of spirit.

In the year 1892 the author commenced work upon the problem of road locomotion, in preparation for what he then believed to be the sooner or later inevitable repeal of the restrictions upon that class of locomotion. The specification No. 23,786 of 1892 describes and illustrates the small motor-vehicle he made in that year, using petroleum oil in preference to spirit, although it is an easy matter to make a spirit motor work successfully and a very difficult matter to make an oil motor do so, for he perceived clearly that history would repeat itself in this matter, and that if the public could get an oil motor at only approximately the same price as a spirit motor there would be no longer a sale for the latter. This is, in fact, what occurred with the fixed motor or stationary engine, and what will occur in the immediate future with the vehicle motor. A certain number of benzolene spirit engines—three, the author thinks—were on the market in 1888, when Messrs. Priestman produced the first oil engine that was exhibited for sale. The author does not mean by this the first oil engine that was successfully running, for in 1886 he had an oil engine on the De Rochas cycle at work. Not very long after the introduction of the Priestman oil engine, spirit engines for stationary purposes gradually ceased to exist. There was no longer any sale for them. The public were fully aware of their danger in comparison with the safety of the oil engines, and when they could purchase the latter they refused to have the former. Moreover, the author believes that sooner or later—probably sooner—the Government will be compelled to re-impose the former restrictions, i.e., those in force before the passing of the Act, in 1896, upon the sale and storage of petroleum spirit—mineral spirit are the official words—or even make them more stringent. For as the motor-vehicle becomes more widely used, and more in the hands of the general public, accidents owing to carelessness in the use or storage of the spirit must become more and more frequent.

Figs. 7, 8, 9 and 10 illustrate the motor and motor-tricycle made by the author in 1892. Fig. 7 is a side elevation; Fig. 8 is a section; and Figs. 9 and 10 are a plan and sectional elevation of this motor-tricycle. These figures are taken from his specification No. 23,786, dated December 24th, 1892, and except for some small details they are fairly accurate. This motor is an "impulse every revolution" engine of the compression class 2 and type 4, in which the opposite face of the working piston is used as a pump to pump the air for the next charge to the combustion side of the piston. Air is drawn through the valve G to the crank chamber B during the upward stroke of the piston E, and compressed by the downward stroke of the piston in the chamber B into the tube L, the channel M, the tube N, the vaporiser H, until the piston E uncovers the exhaust port K in the wall of the cylinder F. The exhaust products of the previous combustion flow through the port K, until at or

\* A paper read before the Society of Engineers, May 1st, 1899.

about the end of the stroke or dead-point. The pressure in the cylinder *F* on the inside or upper side of the valve *J* now falls below that of the lower sides of the valve, and the air mixed with vaporised oil from the feeder flows—in manner to be presently discussed—through the valve *J* into the cylinder, displacing more products of combustion until the commencement of the stroke of the piston has closed the port *K*. The new charge is then compressed by the upward stroke of the piston, and is fired by the tube kept red hot within the vaporiser. The working stroke then takes place during the downward stroke, until the exhaust port *K* is uncovered by the piston, when the series of operations just described re-commences.

FIGS. 7 AND 8.

Fig. 10 shows the method of fixing the motor to the tricycle. The power of the engine is transmitted to the driving axle of the velocipede (or it may be a bath-chair or other vehicle) by means of reducing gear consisting of a bevel pinion *M* and a large bevel wheel *N* which is so arranged upon the driving axle with the friction clutch *Z* that it may run loose upon it when it is desired to stop the machine, or when going down hill, without necessarily stopping the

FIGS. 9 AND 10.

engine; but when the power of the engine is to be communicated to the driving axle, bevel wheel *N* transfers its motion by means of the friction clutch *Z* through the balance gear to the driving axle of the machine, and is under control of the driver by the lever *P*. The usual chain and pedal motion may be added when desired. From the water tank *h* a circulation of water is maintained from the jacket of the motor by the tubular frame of the tricycle, the upper tube *f* taking the water from the jacket to the tank, while the flow to the

jacket takes place through a tube to the frame *g*. The motor is carried by means of the tube *g* and tubes *k* *h*.

It will be seen that, except for the use of a bevel for the ordinary pinion and wheel and a friction clutch, the arrangement is similar to that now in use on the De Dion tricycles. This motor was attached to a tricycle of the Coventry Machinists' make, but it was not very successful, for the motor would occasionally fire the new charge directly after it entered the cylinder and during compression, and this had the effect of reversing the tricycle and running it backwards. It was tested repeatedly for some months in Holborn, at about 2 o'clock in the morning, but as the author could not cure the motor of the liability to reverse it was taken off with the intention of changing the cycle to the De Rochas.

A small vertical motor which the author made in 1893 gave rather over 1 brake horse-power, and weighed complete only 90 lb. It worked upon the ordinary De Rochas cycle, and was constructed especially for vehicles, but was controllable by hand only and had no governor. The speed was 420 revolutions. The oil tank was fitted at the top as in the earlier tricycle motor. The crank chamber was completely enclosed and air-tight, and the crank worked in an oil bath. A few of these were sold in 1893 and 1894, some on the Continent. This motor was exhibited at the Stanley Show of 1894. The vaporiser and oil feeder were very similar to those used at present on the Roots motor. The exhaust valve was operated by skew gear as shown, the second or half-speed wheel being placed eccentrically upon its pin, in this way operating its rod, which pushed open the exhaust valve. The fault of this engine was the absence of a governor. It was intended to be controlled by hand, by simultaneously throttling the admission valve and reducing the stroke of the oil feed spindle. This was effected by a small hand lever on an eccentric pin, but it was not done sufficiently effectively to prevent the motor increasing speed unduly when not driving, and when this occurred misfires followed, making the exhaust smoky. The author was informed that one of these motors was fixed in Genoa to a tricycle, and when running and driving worked satisfactorily without smoke after it had got hot, but the absence of a governor made the motor give off a considerable amount of smoke when running free and not driving the tricycle. This motor, however, ran more satisfactorily than any other attempted oil vehicle motor the author has since seen or heard of.

In August, 1895, the author, conjointly with his partner Mr. Venables, commenced the construction of the first motor-carriage propelled by a petroleum motor made in this country. There had been small and light vehicles of the tricycle type, such as those which have been described, built before, but none, so far as the author is aware, with a carriage body of ordinary construction. Fig. 12 shows this vehicle; it was fitted with a vertical oil motor on the Roots principle of vaporisation and feeding of oil, and was of  $2\frac{3}{4}$  brake horse-power and of  $3\frac{1}{2}$  indicated horse-power. The method of steering is the cycle head and fork, with the addition of a heavy coil spring fitted inside the head, which permitted the fork spindle to slide vertically within the head. When the carriage was first tried in February of 1896, the motor had a friction clutch or drive attached to the crank shaft, so adjusted that if more resistance than the equivalent of  $2\frac{3}{4}$  brake horse-power were placed upon the clutch it would automatically slip. In practice, this slip only took place when starting, when changing speed from slow to quick, and when on the steepest hills. A chain from the friction clutch drove the outer casing of a box of gear providing two speeds, a maximum of eleven and a slow speed of four miles an hour. It was first tried with a speed of thirteen miles an hour, but the side slip or skidding of the single front steering wheel made the steering, when going at this speed on a greasy road, very erratic and even dangerous. The reduction to eleven miles an hour, together with the addition of weight over the steering wheel, completely surmounted this difficulty. The weight of the car was about 13 cwt.

About 18 gallons of water were carried in a tank beneath the floor of the car. A large copper cooling coil was placed in front of the petro-car behind the louvre slats. The water was pumped through the jacket round the coil and into the tank. The governing was effected by an inertia governor operating upon the exhaust valve and the oil feed. This was not found to be perfectly satisfactory, because the dropping of the vehicle wheel in a depression in the road or going over an obstruction would act upon the weight of the governor, throwing it out of position when not at excess speed, so that a rough road would sometimes slow down the motor. The body had ordinary plate springs to attach it to the frame, while the frame rode upon coiled springs fitted to blocks sliding in guides, in a similar way to tram-car springs.

FIG. 12.

The box of gear for changing speed was not found to be very satisfactory, and early in 1896 this was taken off, and the transmission effected by belting and toothed wheels. Two pulleys were fitted to the crank-shaft and two others on a counter-shaft, the bearings of which were fitted to the same slide block moving vertically in guides which carried the ball bearings for the axle, so that the centres of the two shafts were always relatively at the same distance from each other. A large gear wheel on the axle geared always with and was driven by a small pinion on the counter-shaft. The straps

FIG. 13.

connecting the crank-shaft pulleys with the counter-shaft pulleys were both normally loose, and whichever speed it was desired to use, one of two jockey pulleys tightened the one strap and still further slackened the other.

Fig. 13 shows the motor used on this vehicle. This was a single-cylinder vertical motor of very simple construction. The cylinder was  $5\frac{1}{4}$  in. diameter and 6 in. stroke, and was tested frequently in the shop before fixing to the vehicle frame. It gave about 2.75 h.p. on the brake at 400 revolutions, and ran with great steadiness and freedom from smoke or smell. It required some months of the closest attention and labour to make it run in the same way on the car. No doubt the power was the same, but the vibration of the vehicle, and the giving of the springs, affected the accuracy of the measurement of the oil feed, and in this way prevented that perfect combustion in the motor which was obtainable when bolted to a solid foundation. The most careful attention and adjustment also were required to make the inertia governor behave in about the same way on the vehicle as when working stationary. These difficulties were, however, surmounted, and the vehicle ran very successfully for two years, and covered some thousands of miles. From the running of this carriage, the author came to the conclusion that rather less vibration would be caused by a horizontal motor than by a vertical one, which opinion was afterwards justified in his adoption of the horizontal form.

## SOME AMERICAN STEAM-DRIVEN MOTOR-VEHICLES.

By HORACE L. ARNOLD.

CAN a steam boiler and engine be so applied to a mechanically-propelled carriage for use on common roads as to produce a light, commodious, speedy, and elegant vehicle for the transportation of two or four persons?

This question the writer, who has had an intimate personal acquaintance with steam boilers and engines of high and low degree for about half a century, and who has given a large part of his time for the past three years to a consideration of the many varied and perplexing problems involved in the production of the satisfactory motor-vehicle, has always answered confidently in the negative. The bulky and heavy boiler, the constant and large supply of water, and the large, hot fire demanded by a steam engine of sufficient power to drive a motor-carriage strongly, seemed to form unfavourable and wholly unavoidable conditions of steam road wagon driving of such magnitude as to place the steam engine outside the list of possible contestants for popular favour in this service.

It was therefore with the greatest surprise that the writer examined a group of steam motor-cars recently developed in Boston and its immediate vicinity, and found them to exhibit, collectively, all the essential features of the ideal automobile.

These essential features may be specified as follows:—Light weight, small demands on the attention of the driver, total absence of noise or odour of any kind, abundant driving power, and perfect ease of management.

No single one of these Boston steam-vehicles embodies all these ideal features, but there is no apparent reason why each of them should not have all the virtues possessed by any one of them.

The four of these Boston and the vicinity steam carriages which are here illustrated and partly described were made as follows: By George E. Whitney, East Boston, who began work on steam motor-vehicles in 1885, partly built one machine, and then let the matter rest until 1895, when he began again and had his first carriage (weight 650 lb.) on the road in October, 1896, and has since built and sold several others—no two alike, and all considered highly successful; by William B. Mason, founder of the Mason Regulator Company of Milton, Mass., who began his first steam carriage in 1885, sold it when partly completed, and began the car here shown

in July, 1897. This was placed on the road October 4th, 1898: by the Stanley Brothers, the well-known and extensive manufacturers of photographic dry plates, Newton, Mass., who began the construction of the vehicle here shown July 6th, 1897, and had it on the road in October, 1897. They have nearly completed a second wagon for four passengers, and have undertaken orders for a large number of vehicles: and by A. T. Cross, the well-known pencil-case and stylographic pen manufacturer, of Providence, R.I., who began the construction of his steam carriage in October, 1897, and first ran with it on the road in March, 1898.

So far as the writer is aware, H. S. Roper, of Boston, was the first to build a steam road-carriage in or near that city. Roper began perhaps as early as 1870, or even before that time, to experiment with automobiles. He used coal for fuel and built one very successful steam car, weighing 410 lb., having a vertical tubular boiler only 10 in. diameter, coal fired, which attracted much attention and ran in some races against horses. Roper brought out many inventions, and was a very skilful and ingenious machine constructor. He began making a steam bicycle in 1895 or before, and fell dead from this machine in a friendly speed contest with the cyclist Nat Butler on the Charles River cycle track, June 1st, 1896, at the age of 72; his death was due to heart failure. As Roper fired with coal he was unable to closely regulate his steam pressure, and when he had a fire started he was forced to run his carriage or blow his steam off at the safety valve; he was also forced to stop his car and alight to mend the fire. While the Roper carriage lacked many essentials of the ideal motor-vehicle, it was light, quick, and powerful. His steam bicycle ran the mile inside of two minutes, and is said to have weighed about 186 lb.

Whitney, as a young mechanic, did some work for Roper on his motor-cycle boiler, and was very familiar with all that Roper did in the way of steam carriage construction. Whitney afterwards went into business for himself as a yacht engine constructor, and thus became an expert in light steam boiler and engine designing. Whitney and Mason were young mechanics together and intimate friends, and each owned a steam yacht, and it was quite natural that both should begin the construction of steam motor-vehicles in 1885. More serious duties claimed their attention, and the production of a complete steam carriage was long delayed by both.

The Stanley Brothers are not practically trained engineers, but have wealth, mechanical instincts of the highest type, energy, and self confidence, and established an extensive factory so soon as they fully decided upon their model carriage. Their idea is to furnish two passenger vehicles weighing 400 lb. empty, at 600 dols. each. Whitney has so far made all his wagons to order, at prices varying up to 2,000 dols. His inventions are covered by patents which are in the hands of a strong company, and the Whitney steam carriages are expected to be soon placed in commercial manufacture. Mason built his carriage, which is a model of elegance in form and finish, for his own amusement. It weighs about 425 lb., and has cost about 1,200 dols. Cross also built his steam vehicle for his own pleasure. His carriage weighs about 1,800 lb., and cost about 1,500 dols.

The writer has ridden on the Cross, Whitney, and Stanley carriages, and can speak with confidence of their performances. As the Mason car has a Stanley boiler, built by Stanley, and a Stanley burner, it will probably give about the same results on the road as the Stanley carriage, its weight being about the same. Whitney's vehicles are much heavier than the Stanley and Mason cars, and show their weight in hill climbing. The Whitney, Mason, and Stanley boilers are all practically equal, having shells 14 in. diameter, fitted with something over 300 half-inch copper tubes, each 13 in. long, very thin No. 20 B. and S. gauge. The Stanley and Mason burners use vaporised gasoline for fuel, and the fire is controlled by the Mason regulator, which is actuated by the boiler pressure, and holds it practically constant, the regulator operating on less than half a pound of boiler pressure variation.

Some of Whitney's vehicles have had the fire under the control of the Mason regulator, but that on which the writer rode did not have the regulator, and the boiler was fitted with a pop safety valve, which frequently operated. The Stanley boiler, designed by Stanley, is extremely strong, testing to 1,000 lb. hydraulic pressure. Stanley and Mason carry steam to about 130 lb., and their safety valves are set at 150 lb., being prevented by the regulator from ever operating. If the regulator should fail, then the safety valve would of course become useful.

(To be continued.)

## MOTOR-CAR ACCIDENT NEAR LANCASTER.

AN accident, alleged to be due to the negligence of a drunken driver of a motor-car, took place on the Lancaster and Kendal highway at Slyne, three miles from Lancaster, on Sunday evening. The driver, James Robinson, belonging to Leeds, in the employ of the Lancaster and Morecambe Motor-Car Company, was brought upon Tuesday on a warrant before the Lancaster County Magistrates and charged with having been drunk whilst in charge of the motor-car. Superintendent Cocker stated that on Sunday evening the prisoner was in charge of a car containing eight young Lancaster men, which was returning after an outing from Carnforth. On passing through Slyne village it was noticed that the car was travelling at a furious speed, and that the driver was drunk. The car went down Slyne Brow at the rate of from eighteen to twenty miles an hour, and there is a dangerous turn at the bottom of the hill. In the opposite direction, Mr. W. Jackson, mace-bearer to the Lancaster Corporation, was walking with his wife and three children, the youngest, an infant, being pushed in a basinette by Mrs. Jackson. The motor-car came suddenly around the corner and ran on to the footpath, colliding with the basinette, which was smashed to pieces. The baby was knocked over its mother's head a distance of four yards. The child was severely cut about the face, and Mrs. Jackson was bruised about the shoulder and arm, and suffered from shock. Both were conveyed home and medically attended. The motor-car was brought into Lancaster by another driver, and information given to the police, who arrested the prisoner at the railway station on Monday. Evidence having been given, the prisoner was remanded until Saturday, bail being allowed in the prisoner's own recognisances of £25 and one surety of £25.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

**A**S the time for the opening of the great International Exhibition at the Agricultural Hall, Islington, on July 3rd next approaches, so it becomes more and more certain that the success prophesied for it will be fully reached and even surpassed in some measure. Practically the whole of the space on the ground floor has been allotted already, and there remains only a few small scattered spaces, which are all under consideration by various firms, and are certain to be finally allotted. In the galleries the allotting of spaces is also well forward, and new applications continue to be received daily. Practically the whole of the British manufacturers of motor-vehicles have secured space, and several interesting novelties in the form of new vehicles and new motors will be exhibited.

Foreign firms, especially French houses, will also be well represented, although the unfortunate clashing of the French Automobile Exhibition has prevented the attendance of some firms who originally intended to have their vehicles on exhibition in this country.

### Our Commercial Efficiency Tests.

THE series of commercial efficiency trials to be carried out in connection with the Agricultural Hall Exhibition is being received with great favour. Entries are coming in daily in every class, and there appears every probability that the whole of the fourteen classes will be well represented, whilst the 15th division for the longest "non-stop" run on one charge has received a very large number of entries. It is undoubted that the public are becoming tired of mere motor-car "parades." They look upon these gatherings simply as a means of enthusiasts meeting to display their vehicles before the critical eyes of their fellow-enthusiasts. The public as a body learns little or nothing from such a gathering; they may be interesting to the enthusiasts who take part, but such displays do little to educate the public up to the fact that motor-vehicles are not fads but furnish practical means of carrying passengers or transporting goods at rates far below those ruling for similar services by horse-drawn vehicles. It is for this reason that our "commercial efficiency trials" have been projected. We hope by these trials to demonstrate in a manner appealing to all commercial men that motor-vehicles will accomplish tasks day by day, without repairs or breakdowns, that are utterly beyond the capacities of horse-drawn vehicles.

### The Speed of Motor-Cars.

UNLESS some of the most enthusiastic automobilists are extremely careful their present practice of proceeding at high rates of speed through towns and villages will so bring automobilism in disrepute that further laws restricting

their rate of progression will become inevitable. We are not amongst those who hold the opinion that the rates of speed at present allowed are sufficiently high under every circumstance, but as the Legislature lays down a restriction on the speed we do hold that such speeds should not be exceeded. Notwithstanding the fact that the Automobile Club make public announcements that they deprecate drivers proceeding at greater speeds than those within the legal limits, fairly loud whispers have lately been heard that these limits have been far exceeded on several occasions on the Club's tours, and that on more than one occasion actual racing, with all its concomitants of bent heads to avoid wind pressure, has been carried out between several of the cars. The desire for greater and greater speed is the natural result of taking part in motor-vehicle touring; this has been proved in the past in France, and English automobilists are now passing through a similar feverish state. We have lately been assured by several makers that their recent customers are all demanding vehicles capable of progressing at much higher speeds than those formerly demanded. For the advantage of all concerned it would be better to considerably moderate these speeds until the Legislature is induced to enlarge the present limits of speed; even then, however, those automobilists who have the welfare of the industry at heart would do well to reduce their speed to the lowest convenient limit when passing through closely inhabited districts.

### A Loss to English Automobilism.

AT the present moment there are far too few gentlemen in England connected with automobilism either as a business or as a pleasure that the loss of one of their number, even temporarily, can be looked upon with equanimity. English automobilists will therefore regret to hear that one of the most respected of their body is leaving England for some time, let us hope with a view to his ultimate and not too long delayed return. Mr. C. J. M. Instone, in his official capacity as secretary of the Daimler Motor Co., has secured the respect of all who have been brought into contact with him on business matters; his strict commercial integrity and invariable courtesy and politeness transformed the transacting of even a disagreeable business matter into a pleasurable undertaking. In his private capacity, as an enthusiast in automobilism, his pleasant personality endeared him to all who had the privilege of his acquaintance; his knowledge and experience were always at the service of those less experienced or in a difficulty, and if a breakdown occurred Mr. Instone was always ready to sacrifice his own pleasures and comforts in the endeavour to help forward a brother-automobilist. For reasons into which there is no occasion to enter, Mr. Instone has thought it best to resign his official position in the undertaking of the Daimler Motor Co., and has determined to spend some time in France amongst the best motor-car manufacturers in order to increase his already extensive technical knowledge. Let us hope that his return may not be unduly delayed; but whenever it may occur he is, we are convinced, assured of a ready welcome from the large body of English automobilists who value his acquaintance and esteem his friendship.

**Clean Cities.**

THE *Engineering Magazine*, one of leading technical journals published in the United States, views automobiles from the point of view of the sanitary efficiency arising from their use. In a recent issue our contemporary remarks:—"The development of the automobile, accompanied with the increasing use of asphalt paving, is leading to serious discussion of the possibility of maintaining clean streets in great cities by preventing the accumulation of dirt rather than by removing it after it has been permitted to collect. By far the larger part of the dirt which fouls the streets of a city, creating a frequent nuisance, and impairing the health of the residents, is due to the presence of the horse. It might be an interesting experiment to forbid all horses for a given time upon certain asphalted streets, permitting only automobiles and bicycles, in order to observe the length of time which might safely be permitted to elapse before cleaning. It is not at all improbable that the time may come when horses and other animals will be forbidden in the streets as rigidly as they are now barred from public and private gardens; all the transportation in cities being accomplished mechanically and the horse being relegated to the country, to the great advantage of both man and beast. The clean city could doubtless thus be secured, not by cleaning it, but by preventing it from ever becoming dirty."

**A New Utilisation of a Motor-Car.**

THE constant increase in the number of mechanically-propelled vehicles in the streets of the French capital have suggested new uses to which they can be put, both of the tragic and felicitous order. We read, for instance, that an attempt at suicide has just been recorded, the rashly-disposed person throwing himself under the wheels of one of these vehicles driven at full speed along a little-frequented road. The result of this attempt, however, was absolutely the contrary to what might have been anticipated, since the would-be suicide received not the slightest injury, whereas the unfortunate occupant of the car, which was upset, was thrown a considerable distance and severely injured. It appears that when the author of the accident picked himself up, in presence of one or two bystanders, he expressed savagely his annoyance at having failed to kill himself, and even greater annoyance at being arrested on a charge of attempting to cause the death of the gentleman in the motor-car.

**Restrictions of Speeds of Motor-Vehicles.**

THE Eastern District Committee of the County Council, meeting at Falkirk on the 11th inst., decided to consider their powers with a view to the regulation of the speeds of motor-vehicles in their district. A member of the council stated that it was a matter for surprise to him that there had been no serious accidents in the district from this cause. He stated that whenever the cars came to a declivity they ran down as if they were tobogganning, and it really became a serious matter both to pedestrians and people driving on the country roads. Several members substantiated Mr. Hunter's statements, and pressed for an immediate inquiry into the committee's powers in the matter in order that the likelihood of the occurrence of accidents should be avoided by the issuing of restrictive regulations. At Whitechurch (Reading) the Rural District Council have decided to recommend the regulating of the speed of motor-cars through their district to eight miles per hour. Is this the result of the Automobile Club's visit to this district on its Easter tour? At Basingstoke, on the other hand, the proposal to restrict the speed of cars to eight miles per hour was received with ridicule and ultimately rejected, one member of the council remarking that restricting them to eight miles per hour was nonsense, and would result in their extinction! Bravo, Basingstoke!

**Motor-Car Accident.**

AN extraordinary motor-car accident happened at Egham Hill about 5.20 on Friday evening, by which Dr. William Playfair, the eminent obstetric physician, of 38 Grosvenor Street, W., was injured. The car was a four-wheel dog-cart, driven by a Benz motor, and was being taken for a trial trip to Dr. Playfair's country house at Winchfield, with a view to ultimate purchase. The doctor was in front with the driver, and his daughter and his niece, Miss Lucy Playfair, daughter of Lord Playfair, sat behind. When part way up Egham Hill, and just opposite the residence of Dr. Beresford, a local practitioner, the driver found it necessary to change to the lower gear, but upon doing so from some cause the mechanism failed to act, and the car commenced to run back. The light brake was first applied, but, proving inadequate for the gradient, recourse was promptly had to the more powerful one. This stopped the back wheels so suddenly that the front part of the car reared straight up, and shot all the passengers into the road. Fortunately, the driver was little the worse for his spill. The ladies sustained no harm beyond a bruise or two, and were able to lift the car and drag Dr. Playfair and the driver from under it. The doctor received such a hurt to his back that it gave him great pain to be moved. He was carried into Dr. Beresford's surgery, where he was attended to by the assistant, Mr. Sherwen. It appearing, from a cursory examination, that no bones were broken, a rubber-tired cab was procured, and the patient, with Mr. Sherwen accompanying, was conveyed to his own home. The motor-car was but very little damaged. It was ascertained that Dr. Playfair's injuries were not serious, and he expects to be all right in a few days.

**Motor-Cycle Racing at the Crystal Palace.**

THE Crystal Palace Company have promoted a series of motor-cycle races on the track for decision on Whit-Monday. The programme includes a 20-miles scratch race for those riding machines capable of running a mile under two minutes; a 10-miles scratch race for those riding machines outside the mile in two minutes average; a 1-mile handicap for the riders of machines of the first-mentioned class; and a similar event for those riding machines of the lower speed. Gold, silver, and bronze medals will be awarded for each event. The Crystal Palace Company, recognising that the Motor-Car Club is the only body officially controlling motor racing on the track, is running the meeting under the Club's Racing Rules, have entrusted the handicapping to the Handicapping Committee of the Club, and are employing the Club's official timekeepers. We are informed that the entries are numerous in each event, and that it is confidently expected that the records created at the Motor-Car Club's meet on the 6th inst. will be broken. The employment of the Club's official timekeepers at these meetings is, of course, necessary, as the Club refuses to recognise records unless claimed by its official timekeepers and made at meetings run under the Club's rules.

**The Motor-Car Club's Summer Runs.**

THE Motor-Car Club's week-end summer runs commence, we understand, on June 3rd. We are informed that programmes have been drawn up, so that those participating can take part on the Saturday only, or can continue their tour with those enthusiasts who prefer to extend their journey over Sunday. We understand that thirty cars will take part in the first run. The Club is also promoting a motor-vehicle paper-chase. This event is not intended as a road race, as the Club does not countenance such performances, but is simply designed to take the competitors over an unknown and not previously determined course. The trail will be laid by a gentleman whose knowledge of main roads and their numerous diverging by-roads is particularly extensive, and we understand that medals will be given to

those competitors who traverse the whole course without over-shooting any turn therein.

#### The Automobile Club's Tour.

FROM information received from Mr. Johnson, the secretary, we understand that the Whitsuntide tour promoted by the Automobile Club is likely to be one of the most successful of the Club's many excursions at holiday periods. It is to

be hoped that the participants will be favoured with better weather than was the case with the lately-held tour to Frensham, and also that greater success will attend it. In relation to this tour we are informed that, with the exception of Mr. S. F. Edge on his car and Mr. Capel on his De Dion tricycle, no vehicle succeeded in completing the out-and-home journey. Certainly the conditions of weather and roads were execrable, but this should not account for the large number of vehicles failing to complete the journey. We understand that those taking part in the Whitsuntide tour are as follows: Mr. Alfred Bird and Mr. Roger W. Wallace, Q.C. (Chairman); Mr. Frederick R. Simms (Vice-Chairman), Mr. Bryan Donkin, Mr. Hankinson and Mr. E. Lefebure; Mr. F. H. Butler and Miss Butler; Earl Russell; Mr. Estcourt and Mrs. Estcourt; Mr. Michael and Mrs. Michael; Mr. Lyons Sampson and Mrs. Lyons Sampson; Mr. S. Beevor and Mrs. Beevor; Mr. R. W. Buttemer and Mrs. Buttemer; Mr. H. H. Sturmeay and friends; Mr. J. A. Holder and Mr. R. B. Bird; Mr. John R. Hargreaves, J.P., and Mrs. Hargreaves; Mr. W. P. C. Wills and Mrs. Wills; Mr. William Hurst; Mr. Robert E. Phillips; Mr. Campbell Muir and friend; Mr. Staplee Firth, Mrs. Staplee Firth, Mr. Andrew W. Barr, Mr. A. C. Poole, Mr. H. F. Julian, Mr. C. Johnson (Secretary), Mr. Montagu Pilcher, Mr. G. H. Warne and Mr. Worby Beaumont; Mr. and Mrs. C. Cordingley and Miss Pursehouse; Mr. Mayhew and friends; Mr. J. A. Gretton and friends; and Mr. Capel.

#### The N.C.U. and Motor Racing on the Track.

THE fight between the Motor-Car Club and the N.C.U. in regard to the desire of the latter to control or license riders in motor-cycle or motor-car racing, has resulted in the N.C.U. retiring from the untenable position

which it first assumed. Motor-carists generally had no wish to interfere with the N.C.U. in its control of cycle races when the riders were *paced* by motor-vehicles, as this was simply utilising the employment of mechanical power in order to get as much as possible out of the muscular developments of riders of ordinary cycles. But the Motor-Car Club was the first in the field to protect the large, growing body of motorists from the overpowering kindness of the N.C.U. in endeavouring to control the sport of motor-racing on the track, or in carrying out time tests. It is by its endeavours, and by plainly showing that it would submit to no interference from the N.C.U., that the latter body has receded from its former position. In its work of seeking to restrain the N.C.U., we are informed that the Motor-Car Club politely approached the Automobile Club with a request that the two bodies might work in unison, but that no satisfactory reply was received, excepting an intimation that the Automobile Club was "conferring" with the N.C.U. on the matter. Whilst the Automobile Club was "conferring," the Motor-Car Club was "conquering," and by its action brought about some amelioration of the conditions which the N.C.U. wrongfully sought to impose. There is no doubt that this was appreciated by the Automobile Club, for we have received from the secretary the following communication, with a request for an allusion to it in our columns:—

#### THE AUTOMOBILE CLUB AND MOTOR RACING.

Considerable correspondence has recently appeared in cycling and automobile journals as to a proposal by the National Cyclists' Union to control motor racing.

The committee of the Automobile Club, after a conference with the representatives of the National Cyclists' Union, took this matter

into careful consideration, and arrived at the decision that as the mechanical element is undoubtedly the most important factor in the propulsion of motor-driven vehicles, the use of muscular power in races or time tests of every type of motor-vehicle cannot bring the vehicle within the definition of a cycle. It was thereupon resolved that the Automobile Club of Great Britain and Ireland, with which is incorporated the Self-propelled Traffic Association, being the only independent authority in this country recognised by public officials and the Continental Automobile Clubs, constitutes itself as the recognised authority to regulate and control all automobile races, competitions and time trials in Great Britain and Ireland. In accordance with this decision a letter has been addressed by the Automobile Club to the National Cyclists' Union stating that, in accordance with the suggestion of the representatives of the National Cyclists' Union at the conference held at the Automobile Club on March 16th, the Committee of the Club have decided that the Club should take upon itself the responsibility of regulating and controlling motor races, competitions, and time trials. The Automobile Club will now proceed to prepare rules affecting motor racing, and they invite all those interested in this matter to submit by letter addressed to the Secretary at the Automobile Club, 4 Whitehall Court, London, S.W., suggestions for the consideration of the Committee.

We are, as is well known, quite in accord with the general aims of the Automobile Club, and recognise that some head authority is necessary to look after the interests of the automobilists of the kingdom. We regret that we cannot support, however, the position which the Automobile Club has sought to take up in regard to the control of motor racing. It assumes that it is the only independent authority in the country, but this is most certainly not the case. Apart from the Motor-Car Club, there is a large body of automobilists who are not members of the Automobile Club, and the Club's endeavour to constitute itself the *sole* authority, without appeal, is an assumption of authority which it does not possess. On looking over the list of members of the Automobile Club we cannot find that it includes more than two gentlemen who are track racers, and on examining the names of those constituting its committee we fail to find more than a similar number who are in truth properly qualified to frame rules for track racing. The position of the Automobile Club is untenable, and we are sure that the large body of track-racing automobilists beyond its membership will not consent to be bound by any rules which the Club may frame on its own initiative. If the Club desires to partake of the work in controlling motor-cycle racing, it must consent to work with other bodies. In this connection we may mention that the Motor-Car Club has already formulated its rules for governing this class of sport, and several races have already been run under these rules, and champion performances recorded. If the Automobile Club desires to assist in controlling this sport, as it has a perfect right to do, its better course would be to form a Motor-Car Racing Union with those bodies and persons who are not amongst its members. It is only by such a course that satisfaction can ultimately be given to all concerned. Another point in the Automobile Club's circular shows how weak is the Club's position in this matter. After announcing that the Committee has decided to draw up rules, it proceeds to intimate that this body will be glad to receive suggestions for these rules *from those interested*. This confession and acknowledgment that the Club desires to receive the help of outside persons emphasizes the untenability of the Club's assumption that it can control all automobilists in the kingdom.

AN electric cab company has been formed in Toronto by Geo. A. Cox, H. H. Fudger, A. E. Ames, and others, which will build horseless carriages in the shops of the Canada General Electric Company, Peterborough, Ont., under the Fischer patents.

IN connection with their extensive dairy farm at Worsley, near Manchester, the trustees of the Duke of Bridgewater have commenced a service of motor-cars for the distribution of their milk in Manchester and the surrounding districts. The motive power is petroleum spirit, and the experiment is proving highly successful.

## London's Electrical Cabs.

FIG 1.—GENERAL VIEW OF THE COMPANY'S VEHICLES PARADING IN STREETS ADJOINING DEPÔT.

ALL Englishmen concerned in the motor industry are willing to concede to France the premier position in the revivification of the self-propelled vehicle; but, at the same time, it is frequently overlooked that in regard to vehicles propelled by means of electric current taken from storage batteries the credit for the first vehicles commercially successful is properly due to England. Both France and America soon afterwards produced electrically-propelled vehicles, but these did not reach ultimate success until some time after many of England's capitalists had recognised the probable success of electrical vehicles for "hackney" services. In America their utility for this purpose was recognised soon after England had led the way; and the productions of the brains of native inventors, Messrs. Morris and Salom, were made use of to demonstrate the fact. In no other country, however, have the electrical vehicles of native invention been used as commercial hackney carriages. In France the inventions of Englishmen are used, as is also the case in Germany; the vehicle of one French inventor has, however, been granted a licence to ply for hire as a hackney vehicle, but these cabriolets of Monsieur Jeantaud are, we believe, only two in number. In Berlin, as in Paris, the Bersey and Brougham English inventions are used, whilst the Oppermann system is also employed in the German capital. London was the first in the field in regard to motor-vehicles plying for public hire, and to England's capital is due the credit of first utilising an industry commercially, which, although much more advanced in France, had hitherto been restricted to providing carriages for private owners.

The London Electric Cab Company, Ltd., was the pioneer concern in providing the public with motor-cabs. Many prophecies were made that the Company's operations would not result in a financial success, and many recent observations in the press would lead the public to believe that the Company's vehicles had been withdrawn from the streets because they were both imperfect and were operated at a heavy monetary loss. As a matter of fact, however, the success of the Company is assured, as it was from the first, given good management and reasonable utilisation of acquired knowledge. The difficulties of inaugurating a service of public

vehicles were many, and we are afraid were not sufficiently appreciated either by those responsible for the early working of the Company nor by those critics who expected that an entirely new departure could at once be brought to a stage of earning profits, when, as a matter of fact, those guiding the new undertaking were practically working in the dark and without the illumination to be gained from the light of other persons' previous experiences. The undertaking was new, the difficulties encountered and to be overcome were new, and the whole of the servants employed in the carrying on of the work were entirely new to the work. Experience was impossible; there existed no field in which experience could be gained. Therefore, although the Company's first year's work was conducted at a loss, it is not surprising that this was the case, and moreover its possible success was discounted from the fact that it was unable to use a sufficient number of vehicles to reduce the standing or establishment charges to a reasonable limit *per capita* owing to the impossibility of securing them.

The Company was inaugurated on "Motor-Car Day," November, 1896, but it was not until August, 1897, that it was able to place a finished vehicle on the streets. Difficulties were experienced in obtaining deliveries from the coach-builders, who on their parts had an entirely new type of vehicle to design, which had to withstand strains and shocks practically beyond any experience gained in designing other types of vehicles. Battery makers were unable to give immediate delivery of cells capable of giving the output and possessing the necessary length of life, and the makers and patentees of the motors were unable to deliver them in sufficient quantities. Wheel makers were unable at first to produce a wheel with sufficient strength, whilst tire makers, notwithstanding their specious arguments, were utterly unable to produce a tire having a reasonable life even though it had but a low efficiency.

On August 19th, 1897, Mr. W. H. Preece, C.B., F.R.S., presided at the gathering of 5,000 persons which collected to see the sending out of the first fourteen vehicles. Within two months twenty vehicles were on the streets, and a little later thirty were plying for hire. No sooner were the

FIG. 3.—CHANGING A CAB'S BATTERIES AT THE DEPOT OF THE LONDON ELECTRIC CAB CO.

FIG. 4.—ONE OF THE LONDON ELECTRICAL CAB CO.'S BATTERY CHARGING GALLERIES.

FIG. 5.—CONTROL SWITCHBOARD IN THE LONDON ELECTRICAL CAB CO.'S CHARGING GALLERY.

FIG. 6.—A GLIMPSE OF THE LONDON ELECTRICAL CO.'S GENERATING MACHINERY.

cabs on the streets and in constant hard work than difficulties and unexpected flaws commenced to be developed. Perhaps the greatest difficulties arose from the tires. Almost every description of tire was tried and all were found wanting. Pneumatics were of no use owing to the weight they had to carry and the heat consequently generated, which impoverished the rubber on the inside of the tire. Solid tires of several makes and mixtures of various materials were tried one after the other, but with no satisfactory results until recently. The driving chains connecting the road wheels to the power shafts gave trouble owing to their pinions becoming clogged with dust mixed with the lubricating agents employed. Wheels proved faulty, lacking ability to withstand the heavy strains, whilst the batteries, by reason of inherent defects and inadequate charging facilities, also gave considerable trouble.

The non-success of the initial efforts of the Company were, therefore, primarily due to three causes: 1st, imperfect wheels; 2nd, imperfect tires; and 3rd, imperfect batteries and means of charging the same. The original arrangements for charging the batteries were eminently unsatisfactory. The Company at first arranged to take their current from the London Electric Supply Co.'s mains as a "day load." For this purpose two sets of Thomson-Houston motor-generators were employed to transform the alternating current supplied by the Lighting Company into continuous current for charging the batteries, it being thought that the transformation of the 2,400 alternating current to low-pressure continuous current could be effected with an efficiency of about 86 per cent. The result was disastrous, as the "day load" of the Company only existed between the inconvenient hours of 2 a.m. and 10 a.m.,

consequently it was always necessary to use a large amount of current at the higher price of 4d. Even the "day load" charge of the Corporation for current was 3d. per unit, and as the motor-generators did not prove to operate at the supposed efficiency, the cost of current was increased to 4d. per unit.

Then, again, the drivers of the vehicles gave some considerable trouble. Originally they were paid a wage of £2 per week, and were supposed to pay in the whole of their takings, bonuses and prizes being offered for the highest sums paid in. This did not answer well; the drivers may have paid in all their takings, but in most cases these takings were small. Subsequently the cabs were let out to the drivers at rates per day corresponding to the Asquith rules applying to Hansom cabs, but even this did not prove quite satisfactory owing to difficulties previously mentioned in regard to giving the batteries a full charge, and, as a consequence, drivers were quick to take advantage of this known defect, and were continually returning to the yard with a tale to the effect that "their batteries were exhausted, although they had only run to the extent of (say) six shillings in fares"! Strikes, too, were frequent, and the first officials of the Company being unused to the specious wiles of the London cabman, the Company suffered financially accordingly.

Ultimately, a considerable number of these difficulties were overcome, and some experience having been gained as to the success likely to accrue under the new conditions, a bold step was decided on. This was no less than the calling in during March last of all the Company's vehicles then on the streets. Immediately this was done the daily newspapers, and also some of the technical journals, were filled with

FIG. 7.—PUMPS FOR FURNISHING HYDRAULIC POWER AT THE LONDON ELECTRICAL CAB COMPANY'S DEPÔT.

paragraphs anent the withdrawal of the vehicles owing to the Company's non-success in working. It unfortunately was not recognised that it was only on the Company's becoming assured of the success of its future operations that this step was taken; it was taken solely with a view of improving the vehicles and their equipment, and so correcting defects that the public could hire a really perfect vehicle, and with a further view to "commission" fifty new vehicles, constructed on the improved principles developed by past experiences. These are now quite ready. The fifty new vehicles, together with the thirty partially reconstructed cabs will on Wednesday next parade the West End and City streets to prove that, although the Company has been quiet, it is not yet dead, nor has it been sleeping.

It is thought that at last a satisfactory tire has been secured, together with a wheel sufficiently strong to withstand the strains experience has proved to be customary. Stronger springs have also been fitted to all vehicles, and the rim brakes previously adopted re-inforced by band or drum brakes. The method of steering has also been improved, and several important general improvements effected in the cabs as a whole.

The whole of the depôt and charging-station arrangements have been completely re-modelled, extended and improved. The inefficient motor generators have been removed, and the unsatisfactory arrangement of obtaining current from the lighting authority's mains discontinued. The Company now generates its own current, a complete equipment of the highest-known efficiency having been installed. This comprises two independent sets of generators, which can be worked together if necessary; the equipment consists of two Babcock and Wilcox boilers of 300 h.p. each, and two sets of 200-h.p. Willans' engines direct-coupled to General Electric

Co.'s continuous current dynamos. These are shown in Fig. 6. In addition, a Parson's turbo-generator of 12 h.p. is used as a day plant when the large installation is not running, and this also furnishes current for lighting and shop power. The large plant is capable of charging one hundred sets of batteries at one time, and, as instance of the economy effected, the cost of current per B.T.U. is now 1d., as against 4d. under the old method of supply.

The depôt itself has been more than doubled in size. It previously afforded accommodation for fifty batteries of cells, it now has two galleries which can accommodate one hundred batteries at one time. The ground-floor space has been more than doubled, and there is now storage room for 150 vehicles. The means of transferring discharged batteries from the cabs to the charging galleries and for conveying and attaching new batteries to the vehicles are also increased twofold.

It will be remembered that the battery of cells furnishing current is carried, on links attached to compression springs, under the body of the vehicle. The method adopted in removing the discharged battery from a vehicle and replacing it with a new set is illustrated in Fig. 3 and is as follows: The cab with its discharged cells is run into a "dock," the floor of which is a hydraulic lift slightly less in width than the wheel gauge of the vehicle, and somewhat longer than the wheel base. This lift is capable of rising only the few inches which exists between the ground level and the bottom of the battery tray. A wheeled trolley is run on to the lift, and this being in a position exactly under the tray of batteries the lift is raised until the trolley comes in contact with the battery tray, and the whole battery is thus lifted until it no longer rests on the links from which it is ordinarily suspended. The link-pins are withdrawn, and the lift immediately descends to the floor level carrying the batteries on the wheeled

truck. The truck with its burden is then run on to another hydraulic lift; this conveys the batteries up to the charging floor, as is shown in the illustration, Fig. . On reaching the charging floor the truck carrying the batteries is run transversely on to another wheeled truck which travels on the rails shown in Fig. 4, depicting one of the charging floors. It is then conveyed to its proper station, the first wheeled truck travelling over the short transverse rails shown on the raised platforms on each side of Fig. 4. A full set of batteries on its truck is then placed on the gallery trolley and conveyed to the gallery lift, which descends to the ground floor with its burden. The battery on its truck is next conveyed to the "dock" lift under the cab, and this lifts it to its required height and position under the cab; the links are attached to the tray by the pins, the dock lift descends, and the vehicle is then ready for another run of thirty-two miles. Each battery consists of forty cells of the E.P.S. type with a capacity of 150 ampère hours, and carrying current at eighty volts. These batteries when fully charged have a guaranteed mileage efficiency of thirty-two miles. Each cab is provided with two sets of batteries.

The hydraulic power for operating the lifts is furnished by a set of electrically-driven pumps shown in Fig. 7. There are two sets of three-throw pumps, one set by Waygood and the other by Easton and Anderson, Ltd. They are driven by a 7-h.p. shunt-wound motor, current being furnished either by main plant or from the day plant when the former is not running. Both sets of pumps are connected up to a pressure accumulator, having a 6-in. ram with 8-ton load for maintaining pressure. One of the switch-boards for controlling the charging of the various batteries is shown in Fig. 5. It has 100 sets of switches, meters, and resistances, the charging of the whole 100 sets of batteries being controlled by one man.

A complete workshop has been fitted at the dépôt, all machine tools being electrically driven. The Company do the whole of their fitting and repair work, except heavy castings.

The cabs are equipped with  $3\frac{1}{2}$ -h.p. motors of the Johnson-Lundell type; by grouping the cells in series, and in parallel, five forward speeds and one backward speed are provided. In addition to the band and rim brakes, the use of which cuts out the current, an electric brake is also provided as an emergency brake. The series-parallel control switch and the general arrangement of the mechanical details of the vehicle are manufactured under the Bersey and Brougham patents.

When originally constituted the directors of the Company were the Hon. Evelyn Ellis, the Hon. Reginald Brougham, and Messrs. H. H. Mulliner (chairman), H. R. Paterson, and J. H. Mace, whilst Mr. Walter C. Bersey was manager. In October, 1898, Mr. Bersey resigned his position as manager, his place being taken by Mr. J. G. Statter, whilst Mr. Bersey became consulting engineer to the Company. In January of the present year, at the special invitation of the then directors, the Hon. Reginald Brougham, Capt. W. Simpson, and Messrs. G. A. King and J. H. Mace, Mr. Bersey accepted the position of chairman and managing-director, the services of Mr. Statter being dispensed with, and the whole business being worked under Mr. Bersey's personal supervision.

Of the eighty cabs which will be put in service on Wednesday next several will be kept for private hiring and will not bear the ordinary police-license plates. These are specially and luxuriously fitted as private carriages and will be hired out for the hour, day, week, or any other period desired. The remainder will be licensed vehicles and will be rented to drivers at the ordinary Asquith award rates for horse-drawn Hansom cabs. Amongst the vehicles reserved for private hiring are several Victorias. One of these is illustrated in Fig. 2. Fig. 1 gives a general view of the eighty vehicles of the Company formed up in line before starting on their parade through the London streets.

Experience has proved that with the new arrangements the cabs can be run at a profit, and the Company's officials

state that, given the possibility of securing the services of licensed cab-drivers, there is now no fear of the Company's ultimate financial success. We cordially wish these pioneers in public motor-vehicles the success which their undertaking deserves, and as the directors and their friends have personally taken up the greater part of the recently issued debentures it is quite evident that they are willing to back their beliefs in the venture by thus investing substantial sums in the undertaking. All difficulties appear to have been surmounted, and so far as human foresight and experience can provide, the success of the undertaking is assured.

## MOTOR-CARS ON THE CONTINENT.

### Public Motor-Conveyances in France.

A NEW public automobile service for the conveyance of passengers and goods has just been authorized by prefectural order between (1) Hyères and Giens, following the great communication road, No. 42, and its junctions; (2) Hyères and the seashore, following successively the great communication road, No. 42, and the ordinary parochial road, No. 11, of Hyères parish; (3) Hyères, Toulon, and Ollioules; and (4) Hyères and the following localities: La Londe, La Valette, Sainte-Marguerite, Le Peadet, La Tarède, Solliès, Pont and Cuers.

### Paris-Zurich Record.

OUR contributor, M. Dick Farman, proposes himself to establish before long the touring record from Paris to Zurich. He left Paris on Thursday, May 11th, at 8 a.m., and covered the following itinerary: 1st day—Paris, Melun, Sens, Croyes, Bar-sur-Aube, Chaumont; 2nd day—Chaumont, Langres, Vesoul, Belfort, Bâle; 3rd day—Bâle, Zurich.

### The Swiss Automobile Club.

HAVING in view the fact that the Swiss Automobile Club has only been organized six months and a half, the state of its membership shows that the institution is thoroughly prosperous. At a recent sitting of the Committee it numbered 13 honorary members, 109 active members, and 50 foreign members. The Club accepts ladies as members, but the Committee has recently decided that only the wives, mothers, sisters, daughters, or relations of the male members would be accepted.

### Marot-Gardon Cup.

THE Marot-Gardon Cup, over a course of 100 kilometres, was contested last week. The start took place at 2 o'clock exactly, fourteen competitors taking part. The outward fifty kilometres were covered by Girardot in 59 m.  $2\frac{1}{2}$  s. In the return run Girardot gave up at the eightieth kilometre. Tampier was then leading, but he was overtaken at the ninety-fifth kilometre by De Madec. The times were as follows:—First, De Madec, 2 h. 3 s. (Aster motor); second, Tampier, 2 h. 45 s.; third, Ricard, 2 h. 1 m. 31 s.; fourth, De Méaulne, 2 h. 6 m. 14 s.; fifth, Oury, 2 h. 6 m. 39 s.; sixth, Boureau, 2 h. 8 m. 25 s.; seventh, Greterin, 2 h. 16 m. 28 s.; eighth, Cormier, 2 h. 36 m.

### Marseilles Races.

ON the occasion of the races organized by L'Union Vélocipédique de Provence, automobile competitions were held on the Gardanne-St.-Maximin-Pourceux-Gardanne Road, about 73 kilometres. The results were—Motor-cars: 1st, Mèry, 2 h. 2 m. 57 s.; 2nd, Gras; 3rd, Ripert. Motor-cycles and voitures: 1st, A. Lebrun, 2 h. 2 m.; 2nd, Camoin; 3rd, R. Lebrun.

### More Accidents In France.

LAST Saturday, at about 7 a.m., M. and Madame Peignies, of Boulevard du Roule, Neuilly, were driving a motor-carriage from Corné to Angers, when M. Peignies transferred the control of the vehicle to his wife. Of course, as usually happens with inexperienced novices, the lady wished to proceed at a higher speed than was conducive to safety, and as a result the control became difficult, owing to her inexperience, while going down a gradient of 1 in 14. During the descent the carriage encountered a large stone on the road, and was immediately overturned, M. and Madame Peignies being both violently thrown out upon the rough road, and seriously injured. Madame Peignies especially is reported to be in an alarming condition. The motor-vehicle is entirely wrecked by the violence of the shock, and quite out of use.

### Draguignan Races.

THE motor-carriage races to be held at Draguignan on May 21st are expected to be very brilliant, although at the time of writing the entries are not very numerous. Up to the present date the following names have been booked: For motor-carriages, Messrs. Chauchard (of Nice V.C.), Gilbert (of the Marseilles A.C.), and Turcot-Méry; for motor-cycles, Messrs. Jouan Frères (Grasse), Muraour (Grasse), Mercadé and Engelfred (Nice).

### The Moscow- St. Petersburg Race.

A MOTOR-CAR race between Moscow and St. Petersburg is to be held in Russia from June 6th to 13th. The race will be run with a halting-place in Wichin-Wolstchok. All kinds of motor-vehicles are permitted to take part. The registering fee is 20 roubles and 5 roubles for each passenger, beside 25 roubles which will be returned if those who enter take part in the contest. The prizes consist of gold and silver medals.

### The French Kilometre Record with Petroleum Spirit Motor-Vehicles.

M. LEFEBVRE, who at Achère has beaten the record of M. Loysel, though not accomplishing the time of M. Lemaitre at Nice, requests us to point out that M. Lemaitre's times do not constitute a record, not having been officially chronometered, and the route not being quite level. M. Lefebvre is thus in possession of the records until somebody else does better. Doubtless Mons. Lemaitre will soon enter a challenge.

### "La Coupe des Motocycles."

THE contest over 100 kilometres, organized by the French Automobile Club, was run on Sunday, the 14th inst., on the road from Orléans to Vierzon. Although the race commenced at a point somewhat far from Paris it proved interesting, as thirty-five competitors, whose names are below, entered for the contest:—1, Noé Boyer (Béconnais); 2, Delaugère (Romain); 3, Et. Giraud; 4, L. Girardot; 5, V. Oury; 6, A. Darracq (Marcellin); 7, A. Darracq (Willaume); 8, Ph. Marot-Gardon; 9, Ph. Marot-Gardon (Caron); 10, Société Française des Cycles Automobiles Liberator (Gasté); 11, de Dion-Bouton (Rolland); 12, Société Commerciale d'Automobiles (H. Tart); 13, de Dion-Bouton (Teste); 14, de Dion-Bouton (Bardin); 15, de Dion-Bouton (Osmont); 16, Coutand (Renaux); 17, Coutand (Siollac); 18, L'Idole (Searle); 19, L'Idole (Vignaux); 20, L'Idole (Théodore); 21, Roguet; 22, Williams; 23, Mariot; 24, Macon; 25, Delaugère; 26, Wilfrid; 27, Echalié; 28, Vasseur; 29, Deckert; 30, Thévenet; 31, Voigt; 32, Comiot; 33, Perfecta (Géo); 34, Degrais; 35, P. Huguet. The winner holds for one year the cup which Baron de Zuylen

presented for this contest two years ago. The cup becomes the competitor's property if he wins it twice. Up to this time MM. Leon Bollée and P. Marot have each held it once. The contest was won by Béconnais on a Noé-Boyer tricycle, fitted with an Aster motor. He covered the 100 kilometres within 1 h. 46 m. 12 $\frac{3}{4}$  s., which beats all French records on road or on track. Béconnais made the 50 kilometres back within 49 m. 7 s., a wonderful average speed of about 61 kilometres per hour. The result was as follows: 1, Béconnais (Aster), 1 h. 46 m. 12 $\frac{3}{4}$  s.; 2, Osmont (De Dion), 1 h. 48 m. 42 s.; 3, Teste (De Dion), 1 h. 50 m. 38 s.; 4, Renaux (Coutand), 1 h. 51 m. 38 s.; 5, Bardin (De Dion), 1 h. 52 m. 12 s.; 6, Williams, 1 h. 54 m. 30 s.; 7, Vasseur, 1 h. 54 m. 44 s.; 8, Tart (Soc. Commerciale), 2 h. 0 m. 8 s.; 9, Romain (Delaugère), 2 h. 4 m. 10 s.; 10, Caron (Marot-Gardon), 2 h. 5 m. 40 s. It will be seen that all these racers have made an average of more than 40 kilometres per hour, which is very good travelling upon the road.

### The French Automobile Club's New Home.

THE palatial premises of the French Automobile Club are now almost completed, the extensive alterations and decorations having occupied several months. The club premises are what were formerly known as the Plessis-Bellièvre mansion, facing on to the Place de la Concorde, and situated next door to the Cercle de la Rue Royale on the one side and to the Union Artistique Club, familiarly known as the Epatant, at the corner of the Rue Boissy d'Anglais on the other. These premises were purchased for £60,000, and the work of transforming them into the new home of the Automobile Club is already well-nigh completed, although the members have been in occupation of certain suites of rooms for some time. The frontage of the mansion, a fine specimen of palatial Louis XIV. architecture, has not been altered, but the interior arrangements and fittings have been completely remodelled and brought up to date. The ordinary club rooms include offices occupied by the Syndicate of Automobile Industries, a technical library, and exhibition halls. The basement will be taken up by a workroom for repairs, to and from which vehicles will be conveyed by lifts. On the ground floor storage is provided for 200 motor-cars. The upper stories are devoted to club life, and to the social side of existence. One of the chief attractions of the Automobile Club is its dinners, followed by the evening cigar on the terrace surmounting the roof, a kind of hanging garden, whence one of the finest views in Paris is obtained. From here the visitor can view the Place de la Concorde and the Champs Elysées brilliantly illuminated, the Seine lit up with coloured lamps, and the city stretching beyond wrapped in a faint phosphorescent glow. The Automobile Club will, however, provide also, for those who find looking at scenery a little slow, amusements of another kind. The proposed theatre on the first floor is still in course of construction, but will soon be completed and opened. Besides performances, lectures will be given, and next year the Universal Automobile Congress will be held there.

THE Pope Manufacturing Co. have made arrangements for the care of their electric carriages at Narragansett Pier and Newport, R.I. A number of the summer residents in both places own Columbia electric vehicles, and accordingly arrangements were entered into with the Newport Illuminating Co. and the Narragansett Pier Electric Light and Power Co. to furnish facilities for recharging batteries.

BEFORE Mr. Justice Cozens-Hardy, in the Chancery Division on Wednesday, the petition of E. J. Morris for the winding-up of the Universal Motor-Carriage and Cycle Company was allowed to stand over to the first petition day in next sittings, counsel for the petitioner not having had an opportunity of considering the evidence filed by the Company in opposition to the petition.

## SCOTTISH NOTES.

### The Management of Public Services.

A VERY sensible letter, which is worthy of the attention of all interested either in the management or as shareholders in the numerous motor companies recently formed, from the pen of Mr. S. F. Edge appeared in *The Motor-Car Journal* of May 5th on the subject of the "Care of Public Motor-Vehicles." Mr. Edge's description of some of these cars which he recently inspected reminds me of early days of the motor-car services in Scotland. It appears that the same lack of care of the vehicles which marked the institution of this new business in the North is being repeated in the South. Mistakes, no doubt, must be looked for at the outset in an entirely new industry, but I had expected that the manufacturers, who have by this time had considerable practical experience, would have insisted above everything else that the vehicles they put out were placed in competent hands and kept under intelligent supervision. It is undoubtedly true that the inexperienced expect too much of "the motor-car." They expect the vehicle to be ready at any and all times, and by the simple turn of a handle to go on for ever, or at least as long as they require it, and it should need no attention whatever. I have always considered it a great mistake of certain makers who assure intending purchasers that their motor-cars "require little or no attention" and that the necessary knowledge of their management can be acquired in so many minutes. It would be much better for both seller and buyer were it made perfectly clear that a motor-car required a great deal of care and attention. The buyer would put himself about to understand his motor and would devote time to acquire the necessary technical knowledge of its principles, and mechanism, which alone can give him the confidence he desires and the satisfaction he expects from his machine. I would earnestly advise the directors of all concerns running or intending to run motor-vehicles to see that sufficient time is allowed for the daily cleansing and overhaul of their conveyances. If it is usually too late at night to have the cars washed and examined and there are no men on night duty, it will pay to reduce the number of daily runs to allow of this being done. It is absolutely imperative, after running all day and covering a distance of sixty, seventy, or eighty miles over uneven and often rough road-surfaces that every bolt, nut and joint should be looked to. Neglect of this may lead to accident, and certainly does lead to an extraordinarily rapid depreciation. Unless motor-vehicles are as fairly treated as, say, a railway locomotive there is bound before very long to be dissatisfaction all round and much injury done to a promising business. Motor-running companies can and do yield good profits, but this is and will only be the case where the cars receive the highest consideration. I have dwelt on this subject at some length because from my knowledge of the early experiences of those conducting this class of business in Scotland I have come to the conclusion that this is the one outstanding point which requires the most exacting attention, or the results within a year's time or less will be deplorable; those companies which are just now, as Mr. Edge puts it, "starting so gaily" will suffer severely and be tempted to give up the motor-car in disgust—the motor-car getting all the blame, of course—unless due attention is paid to the timely warning of Mr. Edge.

### Motor-Cars in Glasgow.

Two very handsome motor-carriages have during the past week or so been running in Glasgow, everywhere creating a very favourable impression both on account of their design and their quiet-running qualities. Mr. Sleigh (of Rossleigh, Ltd.), on his ivory-white Stirling-Daimler, has been a good deal in evidence in the city, and I have heard many highly favourable comments from quite

unexpected quarters. The other motor-car which attracted attention in Buchanan Street, Sauchiehall Street, and elsewhere was an elegant mail phaeton in which Mr. John Stirling was this week making his business calls in the city. This had a style and character which impressed one at once. Its design was artistic and pleasing, and there was a decidedly substantial appearance about it. A few more well-appointed cars such as those just mentioned seen on the streets of Glasgow will certainly speedily convert many who I have heard object to the motor-car because of its inartistic appearance.

### Edinburgh Post Office and Motors.

THE authorities at the Edinburgh Post Office have for some time been investigating the subject of motor traction for postal work, following the example of the officials at St. Martin's-le-Grand. The Madelvic Motor Carriage Company, Ltd., of Granton, have been awarded the contract for carrying the mails between the General Post Office and Leith. On Sunday last the service was successfully inaugurated, when the first mail van left the General Post Office for Leith at 4 p.m. and worked back within the hour, picking up bags all the way from the pillar-boxes. This is the second motor-car used by the Post Office authorities in Scotland. The first was introduced about a year ago, carrying the mails between Inverary and Ardrishaig, a distance of about thirty miles. The car used was a Daimler, built by Messrs. Stirling, of Hamilton, for the Glasgow Motor-Car Company. The van which started this week in Edinburgh is propelled by an electric motor. The chief points of interest in the construction of the vehicle is that it is built on a strong frame of steel tubes, and the motor works directly on the leading axle. To outward appearance the body of the van resembles those in use for mail purposes now, except that it is mounted on steel wheels with bicycle spokes. In front of the driver is a large case containing the accumulators. This is attached to the framework which carries the motor and front axle, and in steering the whole turns in answer to the helm. The accumulators, motor, and driving wheels take the place of the fore-carriage of the ordinary vehicle, and form, in fact, a tractor. The van can be turned round in a very short space, which makes it particularly suitable for City traffic. The body is painted Post Office red, and picked out in black and gold, the panels being emblazoned with the royal arms of Scotland and the royal monogram surmounted with crowns. A large crowd of interested citizens turned out to see the first run of this van, which I am informed is guaranteed to carry over 10 cwt. of mails. For trial purposes few routes could have been found more difficult than the long incline from Leith to Edinburgh, ending in the steep Leith Street ascent. I hope the trials will be successful, and that the Post Office may see their way to extend their motor mail services.

### The Queen's Birthday.

THIS holiday in Glasgow was fixed for Thursday last, and I learn from the motor hiring concerns in the West of Scotland that a considerable number of Glaswegians spent it on motor-cars, a noticeable feature, I am told, being that parties who tried the motor-car for the first time last year, this year booked their orders a long way ahead in order to secure a repetition of their pleasurable experience of a year ago.

### The Scottish Club.

THE committee which was appointed to consider the advisability of convening a public meeting in connection with the proposal to form a Scottish branch of the Automobile Club met on Wednesday, 10th inst., at the chambers of Messrs. Mitchell & Smith, Glasgow. From the

support which was promised, the committee felt justified in at once proceeding with the arrangements for a public meeting of autocarists and others interested in the motor-car movement in Scotland. The proposal is being enthusiastically taken up, and in the course of the next few weeks the Scottish Club will, I believe, be an accomplished fact. A circular is in course of preparation, and will be issued shortly, calling the proposed inaugural meeting.

#### A Spin on a Pennington.

LAST week I had another opportunity of sampling the new Pennington motor, and from the way the small single-cylinder machine pulled with three heavy men aboard I am made to wonder what the "twin-motor" will accomplish. It travelled on the level at certainly fifteen miles an hour, and one hill ascended would be about 1 in 15, which was mounted half-way on the high gear. I was more than ever impressed with the unique points in this machine, and so soon as large numbers get into use they are sure to be very popular. They are light, simple and handy, and are sold at a reasonable price.

#### A Forth Bridge Char-a-Bancs.

THE motor service between Edinburgh and the famous Forth Bridge is, I learn, to be augmented this summer, the Madelvic Motor-Carriage Co., Ltd., promising a large electric char-a-bancs. The route last year was served by the Edinburgh Autocar Co., who ran their motor-brakes with considerable success, receiving the support of a large number of tourists and others.

#### Aberdeen to London and back.

AN interesting account of this long trip accomplished by Mr. Wm. Jackson and Mrs. Jackson, of Thorngrove, Aberdeen, on a Peugeot motor-phæton appears in the *Aberdeen Journal*. "The party have now returned to Aberdeen," says the journal referred to, "after a most enjoyable and unique three weeks' trip. The travellers were most fortunate in the matter of weather, and were not subjected to a single shower of rain until the final stage of the journey between Stonehaven and the Granite City last Tuesday afternoon. The up-journey was accomplished by the east route, and the principal cities and towns through which the motor-phæton passed were Edinburgh, Newcastle, York, Gainsborough, and Huntingdon. The homeward journey by the west route was through Oxford, Birmingham, Manchester, Windermere, Dumfries, Glasgow, Perth, and Aberdeen. The chief reason for undertaking the journey was a desire on the part of Mr. Jackson to test the capabilities of the carriage upon a sustained and prolonged trial, and he now states that he firmly believes that mechanically-propelled vehicles are bound to come more and more into use. Nothing occurred to the carriage beyond some slight inconvenience consequent upon the novel mode of travelling. What did give a little trouble was the impurity of the oil used for promoting the motive power obtained in the course of the journey, and Mr. Jackson states that any one attempting a long run on a motor should see that the oil is drained through a very fine wire mesh or cloth before being put into the tank. Beyond this drawback and two punctures to the tires sustained—one just outside Manchester and another at Denny—no mishaps worth mentioning occurred. No more severe test of the capabilities of the motor could be conceived than that to which it was put on the mountainous roads from Kendal to Windermere, and on to Carlisle. The actual number of hours occurred in running to London was forty-six, and the homeward journey was accomplished in about the same time. The net quantity of motor-spirit consumed was seventy-two gallons, which at one shilling per gallon would amount to £3 12s., or, counting the four adult

passengers, 18s. a head for the journey to London and back to Aberdeen. This in itself is a record, and we do not suppose that this long journey has ever been done at so low a figure, except, perhaps, on a bicycle. Little trouble was experienced with horses. Those engaged in drawing carts or vans took no notice of the strange carriage, but Mr. Jackson states that those in charge of motor-cars would always require to be careful when passing high-spirited horses; but even in that case he affirms if coachmen would only keep their eyes on their own charges instead of on the motor-carriage, little trouble would be experienced. The motor makes a slight noise unusual on the highway, and pedestrians thirty or forty yards in front can easily hear it approaching. Mr. Jackson states that he has ridden and driven horses in India and Ceylon as well as in this country, but declares that the pleasure of driving a nice pair is as nothing compared with the exhilarating enjoyment of driving a motor-car. Horses, he points out, become tired and weary, and this has a depressing effect on the driver, but the motor-car never wearies. On and on it goes, as if some unseen spirit were at its heels. Then it runs quietly into the hotel yard, and needs neither refreshment nor attendance. Five minutes is all that is required to prepare it for a fresh journey. Amidst the teeming traffic of London and Manchester the phæton was piloted with ease. At times it crawled along behind a donkey cart or ran quietly alongside a horse. At a policeman's signal it would draw up at once, or it would enter a doorway where there was only one inch space room on each side between the posts. Of course, the motor takes fright at nothing, and stands quietly at doors when the driver is within. In fact, the motor seems to say, 'Take care of me and I will do everything you want of me.' All along the route the party met with cordial and hearty receptions, and when they arrived at Aberdeen they looked as if they were sorry that the first journey to London and back to Aberdeen was over." This journey is, of course, no more remarkable than many others carried out by private owners of cars, but it demonstrates that the demand for "long trips" is on the increase.

"BROWN HEATHER."

## CORRESPONDENCE.

### THE CONTROL OF THE BENZ CAR ON HILLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly insert the following query in your next issue?

In driving a No. 2 Benz "Ideal" up a steep gradient, let it be presumed that it became necessary to stop. I understand the method is to stop with the low-speed band on. To do that, of course, the engine must stop. Wanted to know the next mode of procedure. I do not see how engine is to be started again with the band on the fast pulley and the car on an uphill gradient, the driver being alone in the car. An answer to this from some users of Benz cars of this type will oblige an intending purchaser.

London, S.E.,

May 15th, 1899.

Yours faithfully,

R. E. L.

### THE EFFECT OF "JARRING" ON RIDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have no doubt but that the troubles experienced by Mr. J. E. Tuke on this score have also been felt by other motor-tricycle riders. To my mind the build of the machine is an important factor in the matter of comfort, and whilst some types of tricycles are very comfortable to ride, others are the reverse.

I have been recently trying one of the new multispiral saddles made by Messrs. Brampton, and I must say it is the most comfortable saddle I have ever ridden on for motor work. I would most certainly recommend Mr. Tuke to get

one of these, as I am quite sure it is very much better than any other saddle at present on the market.

I would point out, however, that the finest saddle in the world will not overcome the discomfort attendant on riding a motor-tricycle fast over bumpy roads. My method of riding is to go as cautiously as possible over bad roads, both from a point of comfort and also in consideration of my machine.

Again, I do not know whether Mr. Tuke is in the habit of riding with one foot down and the other foot up, but if he instead rides with his feet equally balanced each way he will find a considerable difference in road vibration.

London, E.C.,  
May 15th, 1899.

Yours truly,  
CHAS. JARROTT.

## SOME AMERICAN STEAM-DRIVEN MOTOR-VEHICLES.

By HORACE L. ARNOLD.

(Continued from p. 160.)

THE Cross steam motor-car is shown in Figs. 1 and 2, general views, and a detail view, Fig. 3, plainly exhibits the Cross engines. The principal particulars of the Cross carriage follow. The fuel used is kerosene, not gasoline. Kerosene is safe, and is always and everywhere obtainable, and in these two points shows advantages over gasoline, although so far very few accidents have resulted from the use of gasoline in motor-vehicles. The weight of the Cross car is about 1,800 lb. The tanks carry fuel for a day's run, and water for one and a half hours. This car is fitted with a

FIG. 1.—SIDE VIEW OF CROSS STEAM CARRIAGE.

surface condenser consisting of 200 feet of "spiral" galvanized iron conductor pipe,  $1\frac{1}{2}$  in. diameter, No. 26 B. & S. gauge, in thickness, arranged in return bends under the carriage body. This condenser saves about one-half of the water used, and has the great advantage of wholly silencing the exhaust and also preventing any visible discharge of steam into the atmosphere. The boiler is of the "Shipman" type, consisting of a vertical water leg, having horizontal "porcupine" tubes, closed at one end and screwed into the water leg, or back, at the other end. The total weight of this Cross boiler and casing is about 450 lb. The burners used were designed by Cross, and the oil admission is governed by the steam pressure. These burners make an audible roaring noise, not, however, so great as to be very offensive. This car has a high rectangular smoke stack, carried up immediately behind the hood, and shown in the side view, Fig. 1, and rear view, Fig. 3; the combustion is not perfect, and a "kerosene smell" is plainly perceptible to the passengers when the wind is from the rear. The regulation of steam pressure is excellent. The engines are a pair of reversing oscillators, having radial valve faces,

and reversing by means of a D-valve, which changes the live steam and exhaust passages. The valve motion is much distorted in order to obtain a cut off at three-quarter stroke the forward motion. This makes the engines very strong when reversed, as the steam follows full stroke. The cylinders are  $2\frac{1}{2}$  in. bore and the stroke is  $3\frac{1}{4}$  in., the same as in the case of the Stanley engines, although Cross had this

FIG. 2.—FRONT VIEW OF CROSS STEAM CARRIAGE.

first information of the Stanley carriage from the writer. The engines are coupled to a  $90^\circ$  double-cranked shaft, which is belted to a divided counter-shaft by four belts  $1\frac{1}{2}$  in. wide, two belts to each division of the counter-shaft. The counter-shafts carry vulcanized fibre pinions twenty-eight teeth, six pitch, which mesh with bronze internal gears of 100 teeth, bolted to the insides of the wooden-spoked driving wheels. The belt pulleys on the engine-shaft are  $\frac{1}{4}$  in. diameter, driving 8 in. pulleys on the counter-shafts. This makes the total

FIG. 3.—CROSS STEAM CARRIAGE, SHOWING ENGINES.

speed reduction from the engine-shaft to the drivers  $7\frac{1}{2}$ . The wheels have wooden spokes and rims, and metallic hubs with plain axle bearings. The tires are solid rubber, by the American Tire Co.,  $1\frac{1}{8}$  in. The tires cost 100 dols. for the four wheels, which are all 38 in. diameter. The gauge is 60 in. and the wheel base is very long, 78 in.

It will be observed that there is no compensating gear used in this wagon; in spite of this the steering appears easy, and the wagon responds very promptly to any motion of the steering lever.

The engines, with their gearing down to the counter shaft, weigh 100 lbs., making the total weight of the motor about 550 lbs. Both engines and gearing are open to light road dust. The best speed is about ten miles per hour. The boiler holds about ten gallons of water and the water tank about twelve gallons of water, which is good for fifteen miles run, and the fuel cost is about two cents per mile. Weight for weight all of these steam carriages use almost nearly the same fuel per mile. The Stanley car will run twenty-five miles on one gallon of gasoline at seven cents, and it weighs 400 lbs., or 700 lbs., say, with two passengers up, while the Cross car weighs, say, 2,100 lbs., or three times as much with two passengers up. The Cross car has all plain bearings while the Stanley vehicle has all ball bearings, even the engine crank-shaft and the connecting rods being so fitted in Stanley's vehicle. The Cross car is of very peculiar outline, as shown in Figs. 1 and 2, which is, from some cause or other, very alarming to horses, while the Stanley and Whitney carriages do not seem to attract the notice of horses in any disturbing degree.

FIG. 4.—STANLEY STEAM CARRIAGE.

The great weight of the Cross car is due to the engine and boiler, which must, of course, be supported by a framework which can carry them safely, and the 2,100 lb. total weight is too much to be placed on ordinary pneumatic tires.

The machinery of the Cross car is all carried on the body of the carriage, which is supported on three full elliptic springs, up to the engines; the engines and counter-shaft are carried on short coiled springs supported on the rear axle. This arrangement gives the boiler a vertical movement independent of the engines, and also gives the counter-shaft pinions a small vertical rise and fall independent of the internal gears carried by the driving wheels.

Fig. 4 shows the Stanley Brothers, of Newton, Mass., in their 400-lbs. steam carriage. This wagon was begun July 6th, 1897, and first placed on the road in October, 1897. The first engines in this wagon were a pair of inclined cylinders by the Mason Regulator Co., 2½-in. bore, and having 3½ in. stroke, link motion; then three more pairs of engines were supplied for this wagon by the Mason Regulator Co., which were over weight according to the Stanley idea, and all four of the Mason engines were laid aside, and the Stanley car is now driven by a pair of vertical engines, 2½ in. bore, with 3½ in. stroke, weighing only 19 lbs., built by J. W. Penny & Son, Mechanics' Falls, Maine. The Stanleys are not engineers, and hence depended

on others for the practical details of their engines. They fixed the weight of the vehicle at 400 lbs., and the pair of cylinders' dimensions at 2½ in. bore by 3½ in. stroke. Mason is a strong advocate of piston valves, while the Stanleys have a leaning towards slide valves, and Mason also believes that a motor-carriage should have a backing motion, while the Stanleys did not think the reversing function essential. The engines now in the Stanley wagon are vertical, of plain marine type, eccentric valve motion, with cut off at five-eighths stroke, non-reversing, and having ball bearings on the crank pins and crank shaft bearings, the pump being driven by a link and beam from one cross head, and having a stroke one-seventh of the piston stroke. There was some trouble with the pump valves at the engine speed, but this has been wholly overcome. Stanley took the Whitney boiler proportions, shell 14 in. diameter, with 306 half-inch copper flues 13 in. long, thickness No. 20 B. & S. gauge. This boiler is gasoline-fired by means of a burner invented by the Stanleys, which gives an absolutely perfect noiseless combustion, the up-take discharge not having any odour whatever, and being wholly invisible. The fire is also invisible, appearing through the fire-box peep-hole as a wavering bluish haze when burning hard.

FIG. 6.—STANLEY STEAM CARRIAGE. VIEW OF REAR AXLE, SHOWING REAR OF FRAME, CHAIN WHEEL, AND BRAKE DOWN.

When low the fire appears as a multitude of very small blue semi-globes. The Stanley burner is 1¼ in. deep, and stands about 3¾ in. below the lower tube sheet, and the smoke bonnet on top of the boiler is about 2½ in. high, thus making the total boiler height inside of 20 in.; hence it is very easily placed under the carriage seat. The gasoline fuel is led from the fuel tank where it is carried under 20 or 25-lbs. air pressure through a vapourising pipe, and thence the vapour goes through a passage which may be closed by the Mason regulator-valve to the burner. A by-pass of extremely limited cross-section leads around the regulator valve and keeps the fire alight. So soon as the regulator valve acts to reduce the fire it also opens a large area of cold air entrance to the fire box, which has the effect of instantly checking the steam production. All this makes the action of the Stanley burner exceedingly prompt, and keeps the steam almost exactly at the regulator pressure in the boiler, no matter whether the carriage is labouring uphill or coasting down-hill. The pump delivery is about constant; the regulator is set at about 150 lbs. and the safety valve at 160 lbs. and never blows off; and as Stanley uses no cylinder drainage cocks the boiler feed is always about the same for, say, each ten miles run, and hence the whole regulation of the fire and water are thus automatically taken care of. The Stanley boiler is supposed to carry 8 in. of water above the tube sheet, leaving 5 in. of steam space,

but an inch or two either way in the water level makes no difference, the boiler acting perfectly down to  $1\frac{1}{2}$  in. of water over the lower sheet. Thus the driver of the Stanley car has nothing to do except to steer and handle the throttle valve. A glass gauge seen on the outside of the wagon body (Fig. 4) shows at a glance where the water level is.

The Stanley power transmission consists of a hard sprocket of twelve teeth on the engine-shaft, and a thirty-tooth sprocket on the compensating gear box on the rear axle, as shown in Fig. 6. The chain has  $\frac{3}{8}$ -in. width blocks, hard, and is one of the Baldwin separable type, with hard pins instead of rivets.

The Stanley frame consists of a well-braced girder at each end, coupled underneath by two lattice braces of  $\frac{3}{8}$ -in. round iron fastened at the crossing, while they are connected on top by two composite top bars, having steel tube ends joined by intermediate wooden staves of the same diameter as the tubes, extending between the diagonal bracing of these top bars, as quite clearly shown in the figure of this wagon and of the Mason wagon, which has the same frame precisely. The wooden staves are introduced to give twisting flexibility to the frame, the wheel axles being rigidly supported on the frame, with no direct provision for accommodating the wheels to an uneven road surface, except that of twisting the frame as specified. This makes a cheap and light frame, which is perfectly safe so long as the wooden staves maintain their integrity. For good road surfaces this frame leaves nothing to be desired. The Whitney frame, however, goes far beyond this, and provides in the most perfect manner for accommodating the wheels to road surface inequalities.

The Stanley wagon body is supported by two half-elliptic springs hung by suspension links to screw clips adjustable on the top frame bars. The chain adjustment is obtained by a right and left threaded screw strut, jointed at one end to the yoke of the rear axle support which surrounds the compensating gear, and at the other end to the lower part of the engine frame, in about the plane of the crank shaft. This permits the rise and fall of the engine and small chain sprocket without material change of chain length, and relieves the pneumatic tires of all weight not carried on springs, which is of great importance.

(To be continued.)

LAST week a handsome motor-car was taken to the Yarmouth Town Hall, for inspection by the members of the Watch Committee, preparatory to granting it a licence. It is the property of Mr. W. Miller, and the production of the Motor Manufacturing Company, of London and Coventry. It is intended for pleasure traffic during the summer, and the carriage portion of the vehicle is arranged with cross seats similar to the horse charrs-a-bancs.

THE British Steam Traction Syndicate, Ltd., was registered on May 9th by Hyland & Atkins, 81 Cannon Street, E.C., with a capital of £12,000 in £1 shares. The Company is formed to acquire any inventions relating to the generation, distribution, storage, or application of steam, and the utilisation of steam for traction purposes; to enter into an agreement with William S. Sargeant, and to manufacture, sell, let on hire, and deal in motors, cycles, and vehicles of all kinds.

It would appear that as far as the capital of the kingdom is concerned, Anerley will have the honour of starting the first public motor-car services in its suburbs. Anerley Hill is a well known gradient—so bad, indeed, that tramways are not permitted, and horse-drawn omnibuses are unable to accomplish the ascent. We understand that a Lifu type of steam-omnibus will shortly be placed upon the road, starting from Croydon Road and finishing its journey at Central Hill. The whole of this heavy gradient will thus be possible of being travelled over in a public vehicle for the first time. If this service is successful others will be started at Gipsy Hill, this district presenting similar difficulties.

## THE COSMOPOLITAN CYCLE AND MOTOR WORKS, LTD.

A WINDING-UP order having recently been made against this Company the statutory meetings of creditors and shareholders were held on May 11th at the Board of Trade Offices, Carey Street, Lincoln's Inn Fields. Mr. Winearls, Assistant Official Receiver, presided.

The Chairman stated that the Company was an English Company which carried on a cycle business in France. It was registered on September 20th, 1897, with a nominal capital of £2,000, which was increased in the following December to £60,000. The object of the Company, according to the memorandum of association, was to establish the business of mechanical, electrical, and general engineers, and to acquire by purchase, lease, or otherwise any present or future business in Great Britain, France, Belgium, or any other country authorised by the memorandum. No statement of affairs had been submitted, but the Official Receiver was informed that the only creditors in this country were debenture-holders. The minute book and trading books were in France, and the Official Receiver had obtained possession of the share and debenture registers only. On January 25th, 1898, an agreement was entered into between Mr. Albert Hoster, of St. Nicolas D'Abermont, Seine-Inférieure (who was the vendor), and the Company, whereby the Company agreed to acquire a lease of works, plant, and machinery at St. Nicolas D'Abermont, with all stock and the benefit of all contracts as from October 1st, 1897, and also a cycle business which had been carried on at St. Cloud. The vendor was unable to transfer the latter business, and the agreement was modified, the consideration being reduced from £55,000 to £35,500, payable as to £500 in cash, £5,000 in debentures, and £30,000 in fully-paid shares. The only prospectus issued was dated February, 1898, and it invited subscriptions for £3,900 debentures for the purpose of providing working capital to enable the directors to secure the expansion of the business. On March 30th debentures were issued as follows:—£5,000 to the vendor; £1,070 was subscribed by the shareholders in the Anglo-French Pneumatic Compensation Cycle Company; and £930 was subscribed by the public in cash. The Company went to allotment on April 14th, 1898, when twenty-one shares only were subscribed for. The total share issue amounted to £30,028. No valuation appeared to have been made of the property acquired by the Company. Mr. C. Robson, a director, stated that the property was freehold and belonged to Mr. Hoster, but was subject to heavy mortgages. The business was created by Mr. Hoster, but the Official Receiver was unable to ascertain how long it had been in existence, or whether any accounts of the previous trading were prepared. Mr. Robson stated that he was assured by Mr. Hoster that the business was improving, and that large orders for cycles could be readily obtained. The Company was promoted by Mr. Robson, in conjunction with Mr. Hoster. It appeared that Mr. Robson was one of the promoters of the Anglo-French Pneumatic Compensation Cycle Company, to which the public subscribed about £7,000. That Company proved unsuccessful, and Mr. Robson stated that he was anxious to find a way of representing the sum mentioned in some new company, so that the subscribers should not lose their money. Knowing of the premises occupied by Mr. Hoster, and that he was desirous of turning his business into a company, he entered into negotiations for the sale of the property to the Company, Mr. Hoster consenting to the allotment to the subscribers of the Anglo-French Company of a number of the fully-paid shares agreed to be issued to him, sufficient to give those subscribers an equal holding in the new Company, without any further liability. All the board meetings were held in France, although the registered office of the Company was at 52 Queen Victoria Street, the address of Mr. Robson. In September last proceedings were commenced against the Company in France by French creditors, and under a bankruptcy *fiat* then made a liquidator was appointed, and it was understood that he had sold the assets and surrendered the lease. Although no particulars of the sale had been received, the Official Receiver was informed that a few hundred pounds only had been realized. Mr. Robson had been asked to give particulars with reference to the dealings of the Company in France and the position of its affairs there, but he stated that he was unable to do so. No formal report had been received from the French liquidator, but the Official Receiver had received a letter to the effect that he had placed the papers before the Public Prosecutor at Dieppe with a view to the commencement of certain proceedings against Mr. Hoster. He (the chairman) was unable at present to specify the nature of those proceedings. The French liquidator contended that the debenture-holders had no priority over the French creditors, and it was impossible to state whether their claims had been admitted.

Mr. Robson said he was one of the heaviest losers through the failure of the Company, and he should certainly do his best to obtain some return for the debenture-holders.

The Chairman said there appeared to be no assets to liquidate, but the matter was one which would require investigation.

The shareholders decided to leave the matter in the hands of the Official Receiver, as liquidator, and the meeting of creditors was adjourned *pro forma* for a week.

## "OMNIBUS AND MOTOR-CAR."

IN the Queen's Bench Division on Friday, the 12th inst., before Mr. Justice Day and a special jury, an action was brought by the Automobile Association, Limited, against the London General Omnibus Company Limited, for damages in respect of injury alleged to have been done by

the negligence of the defendants' servants in driving one of their omnibuses on to a frame of a motor-car of the plaintiffs. From the statement of Counsel for the plaintiffs it appeared that on November 27th last the plaintiffs were clearing some of their exhibits from the Stanley Show at the Agricultural Hall. The plaintiffs engaged a van for the haulage of the carriage frame and motor mechanism to Notting Hill, and it was fastened to the tail of the van by a rope, which was attached to a shaft in the front portion of the motor-car frame. According to the plaintiffs the space between the tail of the van and the front of the car was only about eighteen inches. It was said that the horse and van were proceeding at a slow walking pace, and as the "Angel" at Islington was passed an omnibus of the defendants was driven between the van and the car frame, the horses becoming entangled, and the hind legs of one of the horses became entangled in the frame of the car. The defendants denied that their omnibus was going at a rapid rate, and alleged that the space between the tail of the van and the car was from five yards upwards, and that the driver of the omnibus thought the two vehicles were distinct, that he was going in between them, and that there was room sufficient for at least two omnibuses. It was only when the horses' feet became entangled in the rope, which the defendant said was slack, that the driver became aware the two vehicles were fastened together.

Mr. W. H. Stevenson appeared for the plaintiffs, and Mr. Arthur Powell for the defendants.

After a good deal of evidence had been given Mr. Justice Day, summed up, and the jury returned a verdict for the plaintiffs. The defendants did not contest the amount of £40 which the plaintiffs said the repairs to their car would cost, and judgment was therefore given for that sum, with costs.

### THE BELFAST MOTOR-CAR INCIDENT.

AN appeal was brought by James Gillespie in the Recorder's Court at Belfast against the decision of the magistrates in imposing on him a sentence of one month's imprisonment for having been drunk in charge of a motor-car in Belfast on February 25th last.

Mr. W. M. M'Grath (instructed by Mr. W. Harper) represented the appellant.

Mr. J. Carr said the prosecution had been brought under the 12th section of the Act of '72, which provided that any person guilty of riotous or disorderly conduct and in charge of any carriage was liable to a penalty of 40s., or a month's imprisonment.

Mr. M'Grath said the facts of the case were not disputed, and the object of bringing the appeal was to ask his Honour to reduce the sentence of imprisonment to one of a fine. He thought he would be able to show that there were special circumstances in the case which justified him in making such an application.

Constable Stafford was called by Mr. Carr, and gave evidence as to having, on the date in question, observed Gillespie in a leading thoroughfare of the city under the influence of drink, and in charge of a motor-car. The car knocked down witness and several persons as it was running wildly about the street. Witness, after some difficulty, succeeded in climbing into the car and applied the brake. The car did not stop, but commenced to "scream." (Laughter.)

Mr. Carr: It was well you didn't blow something up. (Renewed laughter.)

Witness, continuing, said he ultimately stopped the car, and placed the driver under arrest. He (witness) had been laid up for a fortnight as the result of the injuries he sustained on the occasion.

Constable Dermott corroborated the evidence of the previous witness. He had also been knocked down by the motor-car on the date mentioned.

Mr. M'Grath said the defendant pleaded guilty, but he had certain circumstances to advance for the purpose of inducing his Honour to change the sentence. The defendant was in the employment of the Northern Counties Railway Company, and on the occasion had unfortunately got some drink. He was a married man, and, in addition to his wife and four young children, his mother was dependent upon him. If he was sent to gaol for a month he would lose his employment, and the helpless women and children would accordingly suffer. Up to the present time he had been a quiet, sober man, and had borne a good character, and had never got into any trouble of such a nature.

Evidence having been given to this effect by Gillespie, his wife, and mother,

His Honour changed the sentence to a fine of 40s., remarking that the constables, who put their lives in jeopardy in endeavouring to stop the motor-car, deserved the greatest possible credit, for by risking their own lives they saved the lives of a great many others.

Mr. Carr said that but for the promptness of the constable who got into the car some lives might have been lost.

District-Inspector M'Ardle said he would have much pleasure in bringing the conduct of the constables under notice.

### PROSECUTION FOR "FURIOUS DRIVING."

BERNARD FRANCIS, of 406 Brixton Road, S.W., was summoned, before Mr. Lushington, for unlawfully driving a light locomotive—to wit, a motor-carriage—at a greater speed than was reasonable and proper, having regard to the traffic on the highway. Police-Constable 107 AR stated that at 5.30 on the evening of the 3rd inst. he was on patrol duty on the Embankment. He saw the defendant driving westwards in a light motor-

car at the rate of twelve or fourteen miles an hour. He called upon him to stop, but he took no notice. The witness, therefore, galloped after him, and succeeded in stopping him near Hungerford Bridge. There was a great deal of traffic on the Embankment at the time, and the defendant passed all the cabs and carriages on the road. Some of the foot passengers who attempted to cross the road narrowly escaped being knocked down. Mr. Lushington said that according to the regulations the driver of a motor-car ought not to go at a greater rate than was reasonable and proper, having regard to the amount of traffic on the highway. According to the constable there was a great deal of traffic on the highway in question at the time referred to in the summons, and he (Mr. Lushington) did not think he was going at a reasonable rate. Defendant was liable to a fine of £10, but on this occasion he would only have to pay £2 and costs.

### THE MOTOR-CAR ACCIDENT NEAR LANCASTER.

At the Lancaster County Police Court on Saturday last, James Robinson, formerly of Leeds, driver of a motor-car, was charged with being drunk in charge of a motor-car at Slynne, near Lancaster, and also with driving the car above a reasonable and proper speed. The defendant surrendered to his bail, and the evidence showed that he drove the motor-car down Slynne Hill at a reckless speed, the car going from side to side, and at the bottom of the hill, where there is a bend, it got on the footpath. At that point Mr. Jackson, the Town Hall keeper at Lancaster, and his wife and family were walking along, Mrs. Jackson wheeling a mail cart in which was a two-year-old baby. The motor-car crashed against the mail-cart, smashing it to pieces, throwing the child out a distance of four or five yards, and knocking Mrs. Jackson down. The latter was unconscious for some time, and was bruised about the face and shoulder, and subsequently had to be medically attended for shock to the system. The child was also hurt, its nose being burst, and the skin taken off its forehead and nose. It was said that the car came down the hill at from eighteen to twenty miles an hour, and one witness said it seemed to fly down. The defence was that the occurrence was an accident, and that the car was only running at the registered speed of six miles an hour, which was probably increased to eight down the hill. The Chairman said defendant might have caused the death of three people. He was fined £10 and costs, or a month, for furious driving; and sent to prison for a month for being drunk.

THE Isle of Man will celebrate Motor-Car Day in July next, for, on the promulgation of the Motor-Car Act from the Tynwald Hill on that day, the use of a motor-car in the island will be legalised.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### The Mors-Pennington Match.

WE are glad to announce that the series of challenges and acceptances in regard to the Pennington and Mors vehicles have at last reached a stage that promises immediate advance being made towards the tests being

carried out. Both parties to the contests have agreed to act on the suggestions made by us in our issue of the 12th inst., Messrs. Pennington and Baines having nominated Mr. John Stirling, of Hamilton, N.B., and Mr. C. G. Wridgway to act as representatives on their behalf, and the Automobile Association, Ltd., similarly nominating Mr. W. Worby Beaumont and Mr. S. F. Edge as their representatives. We have communicated with these gentlemen, and they will shortly meet in London to proceed with the preliminary arrangements. At their first meeting they will jointly nominate a fifth gentleman to act as chairman and referee, and he will himself nominate another judge, so that one judge and one representative of each of the contestants can attend both at the starting and finishing points. The challenge, as accepted, comprises the condition of each car ascending the gradient, starting ten miles south of Shapfell, twenty-five times, and descending at a speed not greater than that of the ascent. The judging of the contests will rest on the best average times made in ascending, the times of the descents not being a judging point in the matter. No doubt the committee of nominees will formulate penalties to become operative in the event of the descents being made at speeds greater than the ascents. The total distance to be covered amounts to 500 miles, the 250 miles of climbing, of course, being the competitive test. The Pennington car is to be a two-seated vehicle (the riders being seated side by side) furnished with a two-cylinder Pennington engine, whilst the Mors car is to be of the ordinary dog-cart type, designed for four persons, but carrying only two. The latter will, of course, be a far heavier vehicle than the former, whilst on the other hand its four-cylinder engine is much more powerful. Both cars are provided with pneumatic tires, and both are driven by belts. In both vehicles the carriage bodies are constructed to run much closer to the ground than is ordinarily the case with English-built cars. In each case the explosive gases are fired by electricity, and the manufacturers lay claim to be able to gain very high efficiency with a very small consumption of cooling water. The Mors car is fitted with a carburettor, whilst the Pennington has no carburettor as ordinarily understood, but is fitted with the inventor's patented device for securing perfect admixture, and at the same time heating the charge to almost firing point before admitting it to the cylinder. The Mors car depends on a cool mixture, the Pennington on a hot—and consequently perfectly dry—charge. The Mors is the production of one of the highest firms of electrical engineers and instrument makers in France, whilst the Pennington car is of British construction, although its inventor is an American. It is undoubted that the carrying out of the contest will be watched with considerable interest, and whichever car proves the victor it will be quite certain that it will have won on its merits.

### Motor-Cars in Porto Rico.

ACCORDING to report, Porto Rico is shortly to have a motor-vehicle service. This up-to-date scheme is, of course, due to the new possessors, the United States. It is said that Mr. T. Watson, of San Juan, is now negotiating with constructors in the United States with a view to provide a steam motor-vehicle service between San Juan and Ponce, the route being over the old Spanish military road, and about seventy-eight miles in length. At present the mails and passengers are conveyed between these points by horse-drawn vehicles, and the time taken in transit is about sixteen hours. The steam motor-vehicles are expected to complete the journey in eight hours. According to reports in the American technical journals the vehicles will be fitted with 10-h.p. engines, and will carry six passengers and two attendants. The cars will, it is said, weigh 3,000 lbs. and be fitted with rubber tires. They are calculated to cost £625, which includes the import duty of £40. The service is to be maintained by ten vehicles, the first to be delivered at the end of July.

### Carbonic Acid Gas for Motor-Vehicles.

RENEWED attempts are being made in the United States to propel motor-vehicles by the aid of carbonic acid gas. Hitherto all attempts to solve the problems involved have proved unsuccessful, but some experimenters have now claimed that they have successfully solved all difficulties. The carbon-dioxide is admitted to the engines under the full vapour tension of the liquid under normal temperature, the gas being heated to a high temperature before being admitted to the cylinders of the engines. One company is reported to have secured a factory at Kingston, N.Y., in which locality several very extensive cement factories are operated. The reputed cause for the selection of this centre as a site for the factory is that arrangements have been made with these cement companies for the gathering and storing of the carbon-dioxide generated during the burning of the cement. It will need considerable and extensive experiments to convince us that the project is likely to be successful. It has been the dream of many engineers to successfully operate carbon-dioxide engines, but hitherto the difficulties encountered have been insurmountable—at any rate, from a commercial standpoint.

### The Use of Motor-Cars as "Feeders" for Railways.

SEVERAL of the railway companies in the United States are becoming converts to automobile vehicles for connecting up their systems to various points that, although sufficiently important to warrant some expenditure, are not yet sufficiently so as to recoup the expenditure necessary to connect them to the main system by ordinary railway permanent way. The New England Co. and the Erie Co. have already developed some considerable amount of suburban traffic by means of motor-vehicles, and the Vandalia Co. is amongst the latest converts to the new vehicles. This Company is now establishing motor-vehicle services between Terre Haute, Indiana, and Harmony, a distance of nineteen

miles; between Brazil and Centrepoint, and between Indianapolis and Plainfield. So far as we know, the Great Western Railway Co. is the only railway company in England who make use of motor-vehicles for this purpose. Some long time ago, we believe in 1897, this Company established a service between Cirencester and Fairford. The difference in policy between the railway companies of Great Britain and those of the United States is perhaps demonstrated by examples offered at Newport Pagnel and Bedford. These places, with a wretched train communication, had to establish their own motor-vehicle services, which are, we believe, proving very successful. It would have been more profitable to the railway companies, however, if they had seized the opportunity and kept the carrying and passenger trade in their own hands. A similarly bad example of the British railway companies' policy is to be found in connection with the conveniences of inter-communication between Canterbury and Herne Bay. Here, too, private enterprise has been allowed to fill the gap that might with advantage have been filled by the London, Chatham, and Dover Railway.

#### Wheels for Motor-Cars.

OUR valued American contemporary, the *Horseless Age*, contains in its issue of the 10th inst. a letter from Messrs. J. M. Quinby & Co., a leading firm of carriage builders at Newark, New Jersey, stating that this firm has received a communication from "one of the leading builders of motor-vehicles in London" requesting the American firm to give their views for and against the use of artillery wheels in the construction of automobiles. There are practically extremely few builders of motor-vehicles in London, although several firms, of course, are making bodies for attaching to the frame and other parts produced by the real constructors of the motive parts of the vehicles. It is rather difficult to understand why our English constructors of motor-vehicles should require information as to the pros and cons of employing artillery wheels for automobiles, and it is even more strange that they should seek information from an American firm of carriage builders who presumably have no experience in constructing automobile vehicles. In every country where motor-vehicles have been constructed trouble has always resulted in respect to the wheels. If power is transmitted through the road-wheels themselves every experience points to the necessity of employing road-wheels of the artillery wagon type. If the chain sprockets are not attached to the road-wheels but are fixed to the axles there does not seem the necessity for employing this heavy type of wheel; this is also the case, generally, when the motor is geared by spur-gearing direct to the axles, but even in this case some constructors have found it advisable to use the artillery wheel. For our own part we incline to suspension wheels for some types of vehicles, but on the other hand we acknowledge that they have not been generally successful. There is no doubt that the tire question and the wheel question are the two most important debatable points in motor-vehicle construction. The type of vehicle, its designed load, its speed, and its projected duty all have influences on these matters apart entirely from the point of view of mechanical efficiency.

#### An American Long-Distance Trip.

MR. WINTON, one of the pioneers in petroleum-spirit motor-vehicles in the United States, has announced his intention of shortly starting out on a long trip from Cleveland, Ohio, where his factories are located, to New York, a distance of 800 miles. Given that the construction of the vehicle and its motor is good, there is, of course, no very great difficulty in such a task, but when Mr. Winton declares, as he is reported to have done, that he will accomplish the journey in four days, English as well as French automobilists will "sort of smile." Two hundred

miles per day for four successive days is a "tall order," and unless Mr. Winton drives at least fifteen hours per day, he will not succeed in his self-imposed task, even when the higher speeds permitted in the United States are taken into consideration. The main roads of the United States are not of the best possible construction, and we think he will find it a sufficiently difficult task to do the journey in six days.

#### The Further Success of Motor-Vehicle Services.

THE Newport Pagnel and Bedford motor-car services are proving a great success, whilst the Bedford and Kempston service is phenomenally so. In one day 387 passengers were conveyed by this service, the distance of the trip being about 2½ miles, and the fare 2d. per journey. Some estimate can be formed from these figures as to whether the car is financially successful, the cost of fuel being a known quantity. In regard to the further development of public motor-vehicles, Bournemouth is one of the latest recruits, the Canford Cliffs service forming a connecting link between the centre of the town and one of its outskirts; whilst at another Hampshire town the other day we were struck with the possibilities of the success of a motor-vehicle service. The district around Southsea is perfectly level, and although there exists a service of wretchedly-horsed trams to some of the adjoining districts, there is plenty of room for good motor-vehicle services. Even if such services were run only between the Pier Head and Cosham they would prove successful. There is always a large floating population in the town and district, and in the summer months the holiday traffic is stupendous.

#### The American Boom in Motor-Vehicles.

THE boom in motor-vehicles in the United States is reaching the usual stage of enthusiasm which our American cousins generally adopt in regard to new things. The daily newspapers are full of more or less garbled and inaccurate statements as to the possibilities of the use of motor-vehicles in the streets of cities and the roads of country districts. Amongst these exaggerations are statements that from 1,000 to 3,000 motor-vehicles are to be put in service for public use within three months in various districts. Whilst giving the United States engineers every credit for smartness in turning out work, those who know anything of the industry of course recognise that such promises are impossible of fulfilment. Notwithstanding this, however, it is an indisputable fact that the citizens of the United States are becoming as wildly enthusiastic devotees of the "new industry" as are our equally volatile neighbours across the Channel. They are bitten by the same fever that attacks all those who experience the exhilaration produced by motoring, but whilst the "Britisher" takes the disease more phlegmatically, the "Yankees" are quite as "light-headed" as the "Froggie." Apart from the daily newspapers, those who watch the spread of the movement in the United States can form some opinion of its genuineness by the fact that all the technical journals of the American Continent are devoting considerable space to discussing the problems involved and to reviewing and commenting upon the works and inventions of the inhabitants of foreign countries. The *Electrical World* is one of the firmest supporters of the movement, and we have had occasion in previous issues to allude to the broad-minded spirit in which this journal has taken up the subject. Recent issues of our contemporary have contained the first of a series of articles on American electro-mobiles written by Mr. Thomas B. Booth. In analysing the constructing of the Pope vehicles, the author remarks that in the batteries used the positive plates are of Planté formation, while the negatives have the active material assembled in masses. The positive plate is strong mechanically, and its Planté formation permits of a high rate of discharge. Its capacity is 3.5 ampère hours per pound of complete cell at a discharge rate of 1.2 ampères per pound,

or about '91 horse-power hour per 100 lbs. This, the author thinks, may be perhaps taken at the present time as the limit beyond which increased capacity must involve a decreased life, although improvement in capacity per pound without sacrifice of durability is being effected at a more rapid rate than was thought possible two years ago. He points out that several pasted cells have lately been developed which have yielded much higher capacities for a given weight, but that with this, short life and early renewals are inevitable. Mr. Booth gives an instance of one cell that has been boomed, having a starting capacity of seven ampère hours per pound, but if a capacity curve be plotted for every successive discharge of this cell, a straight line is obtained which touches zero at about the twenty-fifth or thirtieth discharge. There are, at the present moment, several types of cells of such a character which are being boomed in this country. In the present state of things no more foolish course can be taken than to sacrifice durability and long life for the gain of a high efficiency for a few discharges. Abnormal capacity is only gained by abnormal wear and tear, and it is better to face the difficulty of carrying the heavier weight than the much more unsatisfactory one of finding batteries useless after a run of two or three hundred miles.

#### Military Motor-Vehicles in the Austrian Army.

FOLLOWING the lead of its continental neighbours, Austria is falling into line with regard to the employing of motor-vehicles for army purposes, more especially for the conveyance of stores and camp necessities. Accord-

ing to a military expert, these vehicles "dispense with the need of horses, which can now scarcely be obtained in sufficiently large numbers; they abolish the necessity of conveying fodder for many thousands of horses; they travel five times as rapidly over the most difficult ground, and they are never exhausted. Their use will vastly facilitate the rapid manœuvring of large bodies of troops." All these advantages are perfectly well known to any one who has any experience with automobilism, but when it is gravely announced by the Vienna correspondent of the *Morning Post* that these new military automobile wagons "will carry ten tons, and have a speed of fifteen miles per hour" we begin to have serious doubts as to the correctness of our contemporary's information. A wagon to carry ten tons at fifteen miles per hour over even ordinary roads is, we think, a much too difficult problem for its satisfactory solution at the present moment. Such a load would require the vehicle to be much too unwieldy for any ordinary manœuvring, and the necessary body space to carry such a load would prove, we are afraid, an absolute stumbling block. Even if this difficulty be overcome, to give such a vehicle a speed of fifteen miles per hour would necessitate the employment of such powerful engines that the problem of finding sufficient room for the accommodation of fuel and water would prove almost unsurmountable. To carry a load of ten tons the vehicle itself could not weigh, with its engines, boilers, fuel and water, much less than eight tons, and to move this load at fifteen miles per hour on ordinary roads and over ordinary bridges would, we think, bring about the rebellion of all those responsible for the maintenance of roads and bridges.

#### Results of Inexperience.

ON Wednesday last, says the *Morning Advertiser*, "Shortly after one o'clock, an extraordinary sight was witnessed in Farringdon Road, outside the Memorial Hall, when seven motor-cabs were laid up for repairs. All of them

belonged to the Electrical Cab Company, Limited. The first went wrong in Fleet Street, where it collided with a trap, in consequence of which a wheel was damaged, and the tire was taken off, and it was taken to Farringdon Road for repairs. Almost immediately afterwards two others were proceeding down Ludgate Hill, both with fares, when the

front one ran into the back of an omnibus. The splashboard of the cab was smashed, and the two lady fares were much shaken. Before the cabdriver behind could realise that his colleague was in trouble he had run into the back of the first cab, sustaining the similar damage of smashing the front board. A gentleman who had been travelling in this cab jumped out, and, shouting that he would have £500 damages for it, rushed up Ludgate Hill towards St. Paul's Churchyard amidst the laughter of the crowd. These cabs were promptly removed into Farringdon Road, and a message was sent to headquarters to send on a repairing car at once. Whilst they were awaiting the arrival of this car, another electric cab, coming from the direction of Farringdon Road Station, collided with a coach running to Epsom, with the result that it had its panel badly broken. By this time a huge crowd had gathered to watch the curious sight. The amusement was added to by the arrival of three more cabs, the drivers of which complained of having sustained damages of various kinds. Eventually some of the cabs were repaired and started again, but two of them had to go back to the yard." This was undoubtedly an unfortunate series of *contretemps*; in no instance was the accident due to the construction or equipment of the vehicles themselves, but in every case to the inexperience and carelessness of the drivers. Mr. Bersey, the Company's managing director, had no light task in finding and training some fifty or sixty extra drivers in the short time at his disposal, and although some fault might be found for sending out the vehicles in the charge of insufficiently trained drivers, yet it is not fair to place the blame on the vehicles themselves.

#### A Warning to Users, Purchasers, and Sellers of Motor-Tricycles.

THE British Motor Co. has issued a timely warning to those many users, purchasers, and sellers of motor-tricycles fitted with De Dion motors who have not purchased them from licencees of the Company, or who have imported them from the French makers. It cannot be too widely known that all De Dion motors and tricycles *must* bear a licence plate, otherwise a licence penalty fee of £5 is demandable by the British Motor Co. By an arrangement with De Dion and Bouton these French makers are able to sell vehicles and motors in England, but before exporting them must affix a licence plate, which frees them from any further liability for royalty fees in England. Considerable numbers of these engines and vehicles have, however, in the past been imported into this country without licence plates. Automobilists are warned not to purchase these without demanding the payment of a licence fee of £5 from the seller or making him obtain a licence plate before accepting delivery. Sellers also would do well to cease handling these unlicensed machines, as otherwise they will become liable to actions for damages, as will also the users, unless the licence is obtained from the British Motor Co. In the present issue the Company controlling these patents gives illustrations of the two licence plates in their advertisements. The larger one is issued in England and the smaller in France.

#### The New Brighton Motor-Vehicle Service.

THE Wallasey District Council has refused in the past to grant the promoters of the New Brighton motor-vehicle service the necessary licence enabling them to ply for hire. It has now receded from its position, however, and on the 19th inst. the Health Committee of the Council granted licences to Mr. W. Miller-Metcalf, of Bold Street, Liverpool, who is the moving spirit in the syndicate, to run a service of motor-cars to and from various points in the Wirral peninsula. The scope of the movement is a wide one, and in all eight vehicles will be required to carry on the various services contemplated, which will practically cover the whole of the district between Chester and New Brighton to Hoylake and West Kirby. A start was made with one car on Monday with a Seacombe-

New Brighton service, and the other seven cars will be placed at work as soon as they are delivered. Four will ultimately be employed on the New Brighton-Seacombe route. The service will in many respects be a long way ahead of anything that has been attempted in either this district or on the Liverpool side of the Mersey, the vehicles being luxuriously fitted up, and built with an eye to the comfort of passengers in transit, as well as with a view to performing the journey more speedily. When the whole of the vehicles are to hand, other services to West Kirby and Hoylake, to Chester, and to other Dee-side resorts will be started, and these also cannot fail to hit the popular taste.

**Paignton's  
Motor-Vehicle  
Service.**

THE inhabitants of Paignton and Torquay are after all to have a motor-vehicle service, Mr. T. Adams, of the Torbay Engineering Works, Paignton, having put on the road an excellent "Lifu" steam drag with a 25-h.p. engine and carrying twenty-three passengers. Mr. Adams and a party of friends journeyed to Southampton to fetch the car, which had been sent there from the "Lifu" works at East Cowes. The car left Southampton at 6 p.m. on Saturday, arriving at Bournemouth at 9.15. Bournemouth was left at 9 a.m. on Sunday, and after a ride of ninety miles through the charming country, Honiton was reached near midnight. The route taken was the coast line as far as was practicable. On account of the late time of arrival, great difficulty was found in securing lodgings for the night, and some of the party had to put up with sleeping in arm chairs. The car arrived at Exeter the next day in time for early luncheon at the Bude Hotel, where the company was joined by half a dozen others who had journeyed from Paignton to Exeter by train for the purpose of riding home in the car. The arrival and departure of the car created much interest, as was also the case at Paignton, where a large crowd assembled in the Avenue to witness the arrival.

**Canadian Electrical  
Vehicles.**

THE Canadian Motor Syndicate, pioneers of the movement in Canada, has within the past month established works in Toronto, Ont., and it is said the company is already crowded with orders for motettes, delivery vans and carriages. The motette seems to have caught the popular fancy. Several improvements, notably in frame and wheels, have lately been introduced in its construction, making it stronger, and provision has been made to carry either a 30-mile or 50-mile equipment—the boxes of cells being instantly removable from the side. With this construction it is claimed that it will be possible, by use of a duplicate battery, to keep a car out constantly, making a total of 100 miles per day.

**The Riker Electric  
Vehicles.**

At the Electrical Exhibition held in the Madison Square Gardens, New York, there was a good display of automobiles, the well-known Riker Electric Motor Co. making a particularly good show of electric Victorias, phaetons and traps of excellent finish and pleasing appearance. These vehicles are handled in this country by Messrs. Shippey & Co., of King Street, Cheapside, E.C., who are, we understand, granting licences to various manufacturers, including the Mackenzie Carriage Works Co., of Kennington who have a large number in course of manufacture.

THE electric cabs, which for a brief season disappeared from the London streets, are on the scenes again. The eighty cabs and private electric broughams which are now launched are a great improvement on the last batch, and, as announced in our columns last week, arrangements have been made for letting out private electrical carriages for any period.

## MOTOR-TRICYCLE RACES AT THE CRYSTAL PALACE.

THE series of motor-tricycle races at the Crystal Palace on Whit Monday were seriously marred by the extremely inclement weather. The track was a wash with rain, and although nearly all those who had entered for the various events put in an appearance, many were debarred from starting owing to the state of the weather. Those taking part in the races were drenched to the skin, and their faces were covered with mud thrown up from the track by the front wheels of their vehicles. Under the circumstances, it was not to be anticipated that the records created on May 6th on the same track would be beaten, and as a matter of fact all the times were considerably slower. The meeting was held under Motor-Car Club rules, and the handicaps were framed by the Handicapping Committee of the Club. Mr. F. F. Wellington was judge, two of the official timekeepers of the Motor-Car Club (Mr. F. T. Bidlake and Mr. F. W. Baily) taking the times. The programme included four items:—A mile handicap and a ten-mile scratch race for low-g geared motor-cycles taking more than two minutes per mile, and a one-mile handicap and twenty-miles scratch race for machines covering the mile in under two minutes. In the ten-miles scratch race for slow machines eleven entries had been received, but only five competitors faced the starter. The winner turned up in Charles Jarrott, whose time was 21 m. 43½ s., J. Buck being second, and Stocks third. The winner was forty seconds in front of Buck, whilst Stocks was a bad third. It was the general opinion that Buck should have won this race. He, however, very foolishly let a fresh supply of petrol into his tank so that it was practically flooding the carburettor, and as a consequence he lost ground at the finish and allowed Jarrott to get to the winning post first. Evidently, too, Buck requires more experience in controlling his mixture valve.

In the mile handicap for slow vehicles Jarrott was placed at scratch, whilst the limit man was given 320 yards start. Neither of these started, however, and only three riders faced the starter out of ten entries, viz.: J. Buck 75 yards, J. W. Stocks 120 yards and A. Hoffman 100 yards start. This race, although run in very slow time, was an interesting one, the winner turning up in J. Buck, whose time was 2 m. 12½ s., followed at five yards interval by A. Hoffman, with J. W. Stocks third and close up. In the mile handicap for fast machines six entries were received while five faced the starter. The only absentee was the Hon. C. S. Rolls who had returned especially from the Automobile Club's Whitsun tour in order to take part in this and two other events. He was prevented from doing so by reason of the non-arrival of his machine. S. F. Edge was scratch in this race, Percy Richardson being the limit man. The winner was C. G. Wridgway (20 yards), Stocks being second and Jarrott third. The winner won by three lengths in 1 m. 52 s. An amusing feature of this contest was that Stocks, riding hard, was striving all he knew to pass Wridgway on the fourth lap; as the race was for a mile (three laps) his disgust on being informed of the futility of his endeavours can be imagined. Richardson was unfortunately placed for starting, his mark bringing him right on the middle of the banking, down which he slid sideways twice before starting, owing to the greasy surface of the track. In the last event, twenty miles scratch race for fast vehicles, six entries were received, and five started, Richardson being the absentee. Wridgway ultimately won in 35 m. 27½ s., Jarrott being second half a lap behind and Stocks third. Jarrott could not get his machine to work quickly enough, and lost a whole lap in the first mile or so. This he could not recover, but in the last four laps he picked up rather more than half a lap, and had the race been for another mile, several good judges held that he would have beaten Wridgway for premier position.

## A New Type of Car.

FIG. 1.—THE MOTOR MANUFACTURING COMPANY'S NEW LIGHT TWO-SEATED CAR.—THREE-QUARTER FRONT VIEW.

ON the occasion of a recent visit to Coventry, we were afforded the opportunity of visiting in detail the works of the Motor Manufacturing Co., Ltd., at the Motor Mills, and by the courtesy of Mr. George Iden, the manager, to examine several new types of vehicles now going through the works. We found the works quite full of orders; indeed, we were informed that scarcity of labour in one or two departments was seriously interfering with the output of the large amount of work which the Company has in hand, not only for private customers, but for large syndicates running public motor-vehicle services, as well as for cycle agents and manufacturers who are becoming interested in increasing numbers in the construction of motor-tricycles, and therefore desire to purchase the necessary motors. The Motor Manufacturing Co., Ltd., is, we believe, the only firm in England making the De Dion type of engines for motor-tricycles, and Mr. Iden pointed out to us several lots of engines which were being tested ready for delivery to well-known firms, in addition to other lots in course of being finished for attaching to the Company's own motor-tricycles.

In regard to the new types of vehicles now completing at the works, we found no less than three quite distinct and separate classes in progress. All of them are being fitted with two-cylinder horizontal motors, but in each case the transmission mechanism is arranged on different principles, calculated to furnish the best results in regard to the required duties and class of vehicle, and the horse-power also varies with each type.

We give in Figs. 1 and 2 a three-quarter front view and side view of a type of car which has long been in request in England. It is a light two-seated car of British manufacture and design, far in advance of anything of the sort we have yet seen at the price, and, so far as we could judge from a run of about twenty miles, thoroughly capable of giving satisfaction both in regard to speed and travel and hill-climbing ability.

The weight of the car is well under 10 cwt., even when the tanks are filled with petrol and carrying fifteen gallons of water for cooling purposes. It is fitted with three forward speeds and two reverse speeds, whilst two independent brakes are provided, one consisting of the splendid new form of Lehut band brake, for which the Company are sole agents in Great Britain, and the other of a shoe brake on the tires. The latter is practically never used, as the Lehut brake is so powerful that no further brake is actually required, excepting for the purpose of conforming to the requirements of the Act of Parliament and for furnishing a stand-by in the very improbable case of the Lehut brake breaking down or failing.

The whole of the manipulating gear is placed in the steering pillar shown in front of the driving seat. The steering is controlled by a hand-wheel, and is effected by links attached to the vertical axles of the front wheel. Under the steering wheel is a quadrant, in the notches of which the speed-controlling lever works. This quadrant bears five notches corresponding with the three forward speeds and two backward speeds, the "dead" for stationary position of the

FIG 2.—THE MOTOR MANUFACTURING COMPANY'S NEW LIGHT TWO-SEATED CAR.—SIDE VIEW.

lever being the same as for the first backward speed. In front of this quadrant is a small vertical quadrant bearing an arm actuating a rod which controls the accelerating or retarding gear controlling the speed of the engine. On the footboard are two pedals, one controlling the friction clutch conveying the power from the engine to the transmission gear, and the other actuating the Lehut band brake. In front of the steering pillar is fitted the sight-feed lubricator of the ordinary enclosed box type, and behind the steering pillar is a small vertical rod which controls the reversing of the travel of the car. The car cannot be reversed until this rod is pushed in a downward direction, and as the "dead" or "stationary" position of the speed-control lever corresponds with the first (low) speed of the backing motion, it follows that so soon as this rod is lowered the car is caused to travel backwards; immediately on the rod being raised the backing motion ceases, and the speed lever remaining in the "dead" position the car is at once stationary.

The car body is entirely separate from the frame, carrying the motor and mechanism, and although in the illustration the body is shown as being swung on the single suspension principle, in future vehicles Mr. Iden's double suspension system will be adopted, thus giving the maximum of ease and comfort.

The whole of the motor and mechanical parts are carried under the frame, and although this causes the car to have rather a cumbersome appearance, yet this is much more than counterbalanced by the fact that this position not only secures greater stability and thus very considerably minimises the

possibility of the car turning over, but also provides other advantages which will be quite easily appreciated by practical motorists. The whole of the mechanism is covered by the flat board, shown in the engraving, under the car body. This is removable by unscrewing one nut, the whole of the engine being then opened up for inspection.

The motor is of  $4\frac{1}{2}$  brake horse-power and of the horizontal two-cylinder type; incandescent tube ignition is employed, the lamps, and consequently the explosion chamber of the engine, being placed at the rearward end of the vehicle frame. Power is transmitted through a friction clutch to spur gearing, the latter being carried in a lubricating chamber. The changing of speed, and consequent engaging and disengaging of the sets of spur gearing is effected by means of a rack and pinion device actuated by the speed control lever working in the quadrant on the steering pillar as previously described.

The cooling water is carried in the larger of the two tanks shown in front of the vehicle, whilst the petrol is contained in the lower, cylindrical, tank. In future vehicles this latter tank will be placed behind the water tank, there being plenty of room for it in this position, as can be seen from an examination of the side view of the car.

The car is also made with a  $3\frac{1}{2}$ -b.h.p. single cylinder engine, but this is not recommended, and as the  $4\frac{1}{2}$ -b.h.p. vehicle, even when furnished with pneumatic tires, can be purchased for somewhere about £180, there would appear to be no necessity for effecting the saving of having the always unsatisfactory single-cylinder engine.

The wheels are of the suspension type with tangent spokes, and although the frame in the vehicle illustrated is constructed of tubes, it has been decided to employ angle steel in the future.

We congratulate the Company on their latest production, and have no doubt that it will receive that support which its merits deserve from those requiring light two-seated cars at a moderate price, furnished with full power, and able to travel at good speeds, whilst also being capable of surmounting heavy gradients.

We must leave the descriptions of two other interesting cars that we saw until another occasion.

## CORRESPONDENCE.

### WHAT SHALL WE CALL OUR MOTOR-CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the above question is continually cropping up, and many suggestions have appeared of late in the leading technical journals catering for the new motor-car industry, it is evidently a matter which should be fully ventilated, especially as the "automobile" industry in the future cannot fail to become as important as our railways, tramways, and omnibus organizations have become of late years, both from an industrial and financial point of view. It therefore behoves all of us who are engaged as pioneers in the development and success of "self-propelled road vehicular traffic" to have a solid base to build up the industry upon. We should therefore as a body fix upon suitable names and descriptions of the various types of vehicles used and methods of working them, with a view to educate and properly initiate the public as to the merits of the different systems being introduced, and by this means leave the public to judge for themselves as to the type and system of vehicle best suited to their special requirements.

Self-propelled road vehicles have undoubtedly come to stay, and the demand for this class of vehicle is on the increase. The various types and systems being introduced for both pleasure and business purposes clearly show this. The propulsion of these vehicles is effected by the aid of electricity, oil, petroleum-spirit, steam or compressed air. Hence my object in making a few suggestions at this juncture with a view to formulate a plan and decision relative to the matters in question.

Personally, as is well known, I am a staunch believer in electric propulsion for more reasons than one; but as oil, steam and compressed air all have spheres of usefulness, I say by all means "let them all come," and thus give every system of self-propelled road vehicles a fair trial. The one which proves itself the simplest to handle, the most economical in working, the safest to drive, and best suited to the tastes of the million, whether the power be electric, petroleum, steam or air, is the one which will carry the flag of fortune in front of it by securing the lion's share of the motor-car industry. I must confess I was never particularly struck with the early names given by some pioneer workers to their vehicles, such as horseless cars, auto-cars, motor-cars, mo-cars, or as the French call them, "automobiles," for the simple reason they do not disclose the class of power used. Therefore, some eighteen months back when introducing the "Riker electric" system of American motor-cars into England, in order to distinguish this system, my firm decided to call the Riker cars, "self-propelled electric vehicles." The press caught on to this title quickly, it being described as something new and distinct to other systems described, and although the title is a fairly good one and has become moderately popular, I begin to think it is too long, and can therefore be improved upon, especially as there are now four competitive systems in the market. With a view to clearly distinguish one system from the other, and in order to educate the public as to the merits and working of the four separate methods of propulsion, I would suggest, subject to the approval of the

trade and the Automobile Club, that the different systems should be described thus:—For electrical self-propelled vehicles of all kinds I would suggest, as a *distinct class*, that they simply be called "electro-mobiles." For oil motor-cars of all descriptions I would suggest the name of "petro-mobiles." Steam-driven vehicles should be called "steam-mobiles," and for compressed air methods of propulsion I would suggest "airomobiles." As a distinctive name for any special class or type of vehicle it would be easy to add a prefix specially distinctive, such as "electro-mobile cabs," or perhaps better still, for shortness sake, call it an "electro-cab," "electro-victoria," "electro-phæton," "electro-brougham," "electro-dogcart," or "electro-van," as the case may be. The same would apply to oil-motor systems, as "petro-cabs," "petro-carriages," "petro-vans," etc. Whereas for steam systems, and for shortness sake, the words "steam-wagon," "steam-buses," "steam-car," "lorrey," or "dray" could be used, and so on according to type of vehicle used. Then, if such titles were decided upon, all the public would have to ask, "What system of propulsion is this?" The answer would be "electro," "petro," "steam," or "airo," and by this means complications would be prevented, time and money saved in giving long and exhaustive descriptions of each one's systems as now. All three-wheeled vehicles, I would suggest, should be described as a distinctive class as "motorettes," thus: "electro-motorette," "petro-motorette."

Instead of the word "driving" as now used for horse-driven vehicles, I think the distinctive word "moting," like yachting, biking, coaching, hunting, boating, etc., would suffice, and soon become to be well understood by the public, and thus convey the mode of travelling employed. For instance, one would say "gone out for a trip," or "electro-moting to Brighton," or "petro-moting to Birmingham or Edinburgh." The word "moting" would be a suitable and applicable one for all methods of road vehicular travelling.

Now as to drivers: Instead of coachman I would suggest "motor-carist" or "motor-man," and for gentlemen drivers "automobilists." One could say, for instance, "Captain Brown has got a good motor-carist or motor-man, who steers remarkably well"; or one would say in speaking of a gentleman driver, "Lord So-and-So is a splendid automobilist—just see how he handles the brakes and controllers when 'moting' down to Brighton in his electro-coach."

For housing mechanical vehicles, the word "stabling" is too horsey. "Docking," used by some motor-carists, is absurd, as it reminds one of tail-clipping. I would suggest the place be called the "motorage"; and if this distinctive name is decided upon, country roadside hotel proprietors would soon be found hanging out the usual signs, such as "Good motorage accommodation," and perhaps in the course of time the following additional sign might appear, "Electricity supplied *while you dine, at 2d. per B.T. unit.*" Petro-mobilists would find the signs "Benzine and Petro Stores, first turning to the right," or the left, as the case may be. Noticeboards lettered "Experienced mechanics kept for repairs," in addition to those just mentioned, would also doubtless soon be seen in those provincial districts where hotel proprietors lay themselves out for the accommodation of road travellers at moderate charges. If hotel proprietors would take up this matter the sooner would the whole country receive the benefit of the money which will be expended by supporters of country trips, which tend to advance the new and healthful "automobile industry."

I must apologise for taking up so much of your valuable space, but as the question is one of interest just now I trust you will find room to record my views upon these matters, and thus oblige

13 & 14 King Street, Yours faithfully,  
Cheapside, London, E.C. ARTHUR SHIPPEY.

THE Atlantic Electric Vehicle Co., with principal office at Camden, N.J., has been incorporated to manufacture motor vehicles of all kinds. The capital is £20,000.

Warland Andrews, Abingdon.

THE AUTOMOBILE CLUB'S WHITSUN TOUR.—THE PARTY AT CROWN AND THISTLE HOTEL, ABINGDON.

## The Start from the Club-House.

IN cold and gloomy weather the initial assemblage of those participating in the Whitsuntide tour of the Automobile Club took place at Whitehall Court on Friday morning last. Some fifteen vehicles were ranged in row, while several other owners with their cars were on the ground to see the start. Amongst those present was Mr. Harmsworth on his new Panhard, Mr. Roger Wallace, Q.C., Mr. Worby Beaumont, Mr. Roger Fuller, etc. The start was made punctually at 10.30 for the next meeting place, High Wycombe (31 miles), where lunch was served.

## The Route for the Trip.

THE route has already been given, but we may again mention that Friday's run was to High Wycombe (31 miles) for lunch; to Abingdon (31½ miles) for dinner. Saturday: To Stratford-on-Avon (45 miles) to lunch; Leamington (10½ miles) to dinner. Sunday: Alcester, via Redditch (31½ miles) for lunch; Leamington (18 miles) for dinner. Monday: Birmingham (35½ miles) for lunch; Leamington (26 miles) for dinner. Tuesday: Aylesbury (52¼ miles) for lunch; and returning to London (42 miles).

## The Weather on the Journey.

The weather throughout the five days' tour of 323¾ miles was of the most disagreeable description, the sun scarcely shining the whole time. The rain commenced at High Wycombe and continued without intermission all the way to Abingdon. Next morning opened with heavy showers, which continued more or less during the whole day. Sunday opened dull, and the beautiful views from the Ridgway were obscured. The rain again commenced about mid-day, and continued fiercely for the remainder of the day. Whit Monday opened dull, and continued so till after lunch; then came a deluge lasting some hours. On Tuesday morning the sun shone at first, but soon great black clouds hung over our car till Uxbridge was reached, the rain drenching the riders through and through. At Uxbridge, peculiarly enough, not a drop of rain had fallen, while some of the cars on the journey between Leamington and Aylesbury escaped from the rain.

## The Scenery and the Roads.

The route chosen was an extremely rough though a very beautiful one. The roads were heavy after the rain and the hills were numerous and stiff. The country passed through was a revelation to most of those living in the South, and the general opinion was that the present tour was through the loveliest country the Club had yet visited. Extraordinary trouble must have been taken by Mr. Alfred Bird (with the aid of Mr. Johnson) to map out such a lovely ride, the journey being mostly through country lanes and pretty villages, and exposing for the first time to many of us the innate charms of the heart of England.

## Our Itinerary and Guide Book.

That which Mr. C. Johnson, the popular secretary of the Automobile Club does, he does well, and in the present instance he is again to be congratulated upon the new departure in the shape of the itinerary—which is of pocket-book size and form. Perhaps a better title than itinerary would be to call the booklet a *vade mecum*, for it contained everything in the shape of information that was required, and although the route was mostly through country lanes, and unknown to us, yet the instructions were so precise that we travelled the whole distance without having to make enquiries.

## Names of the Participants.

Among those who took part in the tour were:—Panhard, 6 h.p.: Mr. Alfred Bird and Mr. Roger W. Wallace, Q.C.—Cannstatt Daimler: Mr. Frederick R. Simms, Mr. Bryan Donkin, Mr. Hankinson, Mr. E. Lefebure.—Benz 5-h.p. Dog-cart: Mr. F. H. Butler.—Benz Ideal: Earl Russell.—Daimler: Mr. Estcourt and Mrs. Estcourt, Mr. Michael and Mrs. Michael.—Beeston tricycle: Capt. H. R. Langrishe.—Benz Ideal: Mr. S. Beevor and Mrs. Beevor.—De Dion tricycle: Mr. F. W. H. Hutchinson.—8-h.p. Daimler: Mr. J. A. Holder and Mr. R. B. Bird.—8-h.p. Daimler: Mr. John R. Hargreaves, J.P., and Mrs. Hargreaves.—Benz Ideal: Mr. W. P. C. Wills and Mrs. Wills.—De Dion tricycles: Mr. Robert E. Phillips and Dr. Acworth.—Panhard, 6 h.p.: Hon. C. S. Rolls.—Lynx dog-cart: Mr.

H. E. Zacharias and Mrs. Zacharias.—Hercules car: M. Ducroiset and party.—Peugeot: Mr. A. W. Armstrong and Mrs. Armstrong.—Daimler: Mr. Campbell Muir and friend.—Mors: Mr. Mark Mayhew.—Iveagh phaeton: Mr. C. Cordingley, Mrs. Cordingley, and Miss Pursehouse.—Iveagh phaeton: Mr. Gretton and friend.—Lifu steam wagonette: Mr. Staplee Firth and Mrs. Staplee Firth, Mr. Andrew W. Barr, Mr. A. C. Poole, Mr. H. F. Julian, Mr. C. Johnson (Secretary), E. Shrapnell Smith, Mr. H. H. Sturmey, Mr. Louis D'Egville, Mr. H. J. Swindley, etc.—Other Club vehicles: Mr. A. H. D. Altree, Mr. Montagu

to the fourth, and in fact preferred the first, speed most of the time. At last, on returning from Mr. Bird's residence at Moseley, an ignition tube burst "some miles from anywhere." Of course, being prepared with a second one matters. were soon right again—but, alas! this burst also. A six-mile walk and an eleven-mile drive from Henley-in-Arden landed us back at Leamington shortly after midnight. At Woodstock Mr. Roger Fuller had to spend between four and five hours on his valves, the spindles of the induction and exhaust valves having been bent. Later, misfortune again overcame that gentleman, the countershaft snapping. Four-

Pilcher, Mr. G. H. Warne, Mr. Worby Beaumont.—Daimler: Mr. and Mrs. Roger Fuller. Several other cars took part in short runs on the various days.

With a fleet of five-and-twenty cars, many of them travelling over three hundred miles, incidents and accidents were sure to occur. Our own car gave us trouble from the start, and after a halt of ninety minutes in a stable at

#### "Incidents" on the Road.

Hillingdon, matters improved somewhat; but the car objected

teen miles' travelling, driving backwards, landed the machine at Coventry. The Daimler Co. lent another machine, but a tire came off in the "water splash" at Kenilworth, and Mr. Fuller abandoned motor-caring for the time being.

#### More Incidents.

Mr. J. Hargreave's twin-Daimler came to grief at Leamington through the scoring of one of his bearings, and the car had to be sent to Coventry, while Mr. Sturmey's Land's End to John O'Groats machine came into Woodstock without a tire

on one of the wheels and another one very nearly off. The tire had come off and fallen in the road, not having been missed. Fortunately Mr. Estcourt's car was behind and picked up the tire. Then the strange spectacle was seen of Mr. Michael hawking round a tire, enquiring if any one had lost it! The owner was found in the morning. Mr. Gretton also shed one of his tires, while Mr. and Mrs. Armstrong pluckily persevered with their Peugeot. Mr. Beevor's chains gave him a lot of trouble, leaving the sprocket with appalling frequency; while Mr. Butler also suffered, but to a minor extent, from the same cause.

#### An Exciting Incident.

On the Sunday, the cars left the stables in order, Messrs. Bird and Wallace leading on a 6-h.p. Panhard, the other cars following until well out of Warwick. All the Benz and tricycle riders (including Earl Russell) abandoned their machines for the day and became passengers, so that the cars had their full complement, the "Lifu" having thirteen aboard. The Ducroiset was the last in the procession, and in passing Mr. Estcourt's car got on to some soft earth and slipped into a ditch about twenty inches deep. "Pip, pip," stopped the cars, and the passengers dismounted and went to the assistance of Mr. Ducroiset. Fortunately no one was injured. The combined strength of the whole party got the vehicle into the road again, and it then started running as merrily as ever. At Alcester there was rather a large addition to the number of machines, Mr. Du Cros being present with a 6-h.p. Panhard, Mr. Lanchester and party of friends (five in all) on a Mors, Mr. Critchley on the new light Daimler car, two Frenchmen on a powerful fast car by Audibert, Lavirotte & Co., several motor tricycles, etc.

#### The Behaviour of the Cars.

With regard to the various cars, many travelled very well and gave but little trouble to the drivers. The first word of praise must be given to the Liquid Fuel Co.'s wagonette, "The Lifu," which travelled the whole route, sometimes having as many as fourteen passengers on board. The pace was evenly maintained throughout on the level, and uphill, the extra power so often desired being always forthcoming, enabling the car to mount the inclines at a good speed. There was not one single stoppage for adjustment, and the car was in the charge of a single attendant, who kept the wagonette "spick and span" as regards cleanliness, so that standing in the stable yard it looked always a "thing of beauty." The Ducroiset also travelled the whole route at a steady and good pace, usually (with the exception of Mr. Rolls' vehicle) coming in an easy first at the various stopping places. There is no doubt a great future for the Ducroiset car in this country, owing to its strength and reliability.

#### Hospitable Club Members.

In visiting Kenilworth, which had to be reached through a "water splash" in flood, much fun was caused, a crowd collecting to watch the motors. For this, in at least one instance, they were well drenched for their pains. The "splash" is at the foot of a rather steep hill, and the "Lifu" came down and went through at full tilt. The stream was divided into two, and the concussion was so great that it sent the water over the house tops. It also put out the burners of the "Lifu." Other cars went through at full speed and drenched their passengers. We travelled gently through on our first speed. In our *vade mecum* was a "star," and in reference thereto a short paragraph stating that Mr. J. Broughton Dugdale (a member) invited members to visit Wroxall Abbey, between five and six miles from Warwick, on the Birmingham Road. Following the tracks, which, as all motor-carists know, are supposed to be infallible, we turned in at the lodge gates, facing which were a pair of "stocks," and drew up in front of the lovely residence of Mr. Dugdale, where that hospitality was extended which gentlemen know so well how to appreciate. The electric installation, duplicate in everything,

at Wroxall Abbey is one of the finest we have ever seen in a private house. Mr. Dugdale is an enthusiastic motor-carist and joined the party for the remainder of the day. After lunch, members had sincere pleasure in visiting Mr. Alfred Bird's house, his interest and work in connection with the Club being much appreciated. A long stay was made here, the rain coming down in a deluge; but those present were loth to leave, the welcome being so warm and hearty. The rain having given over on our entering the Uxbridge Road, and being saturated, we had made up our minds to stop to get rid of some of our damp clothes. We were, therefore, agreeably pleased to meet Mr. and Mrs. Wills at their house at Uxbridge, these kind hosts having thoughtfully provided afternoon tea. Their hospitality was much appreciated and taken advantage of by several members, but being so near London and the weather again so threatening many came right through to their destination.

#### Etceteras.

Taking the tour as a whole it must be pronounced a success, notwithstanding the inclemency of the weather. The arrangements and management were all that could be desired. The hotel accommodation was good, and although the Regent Hotel at Leamington is not in any way modern, yet the quietude of its precincts did much to soothe after the rush of the day's work was over. There is no doubt on these tours a lot of excitement and rush, and plenty of work for passengers and drivers. The distances that had to be travelled were great, but in no instance excessive, although we rather take exception to those who "clipped" off corners, and thus saved some miles, as we think when there is a "mapped out" route it should be followed, unless there is a breakdown. A word of praise is due to the police throughout the length of the way travelled. They were most courteous, and were only too anxious to assist and preserve a passage through the crowds which sometimes assembled, and their presence at awkward corners was quite invaluable. The tall iron standards in the Warwickshire country lanes also struck us as an improvement over the old and almost always illegible milestones.

## SCOTTISH NOTES.

#### More Motor-Pacing.

At the Northern Cycling Club's meeting at Glasgow on May 13th a more impressive performance was made by the mechanical "pacers" than on the occasion of the Glasgow merchants' opening meeting at Celtic Park last month. The track was dry and therefore safe, with the result that the "motors" could be let out and a display of their speed qualities given. Some fast work was accomplished when A. D. M'Farlane made an attempt on the ten-mile record.

#### The Stirling-Leyland 'Bus.

THE Stirling-Leyland steam omnibus which I described on May 12th has this week been running further trials at Hamilton, after having received the finishing touches in the "paint shops." The steady, even-running of the 'bus presents a very pleasing contrast to the jerky, irregular motion of horse-drawn omnibuses, and I experienced a sense of comfort in it which I assuredly never before did in an omnibus of any description. The vehicle is well suspended on elastic steel springs and the seats are furnished with easy spring cushions. The 'bus, in spite of its dimensions, has a light appearance, and in no way resembles the heavy, cumbrous-looking motor-brakes and omnibuses which I have seen on the Continent. The total weight of the vehicle is, I understand, about two tons. I think the makers are to be congratulated on the result of their efforts to produce a thoroughly reliable and comfortable 'bus.

**Motor Makers' "Outing."**

THE annual "outing" of the employés of Stirling's Motor-Carriages, Ltd., of Hamilton, is, I understand, fixed to take place to-morrow, May 27th. The whole party, which will number about 150, will be conveyed

from Hamilton in motor-carriages, and the procession of vehicles will pass through the City of Glasgow about 10 a.m. Through the kindness of Mr. Stirling I hope to take part in the excursion, and next week will give a description of the vehicles taking part, with photographs taken *en route*.

**The Glasgow Holiday.**

A MORE miserable day than Thursday of last week, when the denizens of Glasgow were supposed to make merry on account of the Royal "Birthday," is hardly conceivable. From a very early hour heavy, close-falling rain continued

almost without cessation until evening, making enjoyment out of doors altogether impossible. In spite of it all, however, I observed some half-dozen motor-car loadfuls of holiday-makers on the road. One or two of the vehicles were covered, which of course made the outing to some at least tolerable. The expression on the faces of the passengers in the open cars, however, was scarcely what could be described as "pleasant." It would be well, I think, in view of the repetition of such a day as Thursday, if motor-hiring concerns would provide their cars with tops, which could, of course, be made portable. It would certainly reduce the hesitancy on the part of excursionists to book their seats forward if they were assured that, whether the weather was propitious or otherwise, their trip could be accomplished with comparative comfort.

**The Scottish Cycle Trade and Motors.**

ENTERPRISING cycle agents everywhere are keeping a sharp look-out in order to miss no suitable opportunity of attaching themselves to the motor industry, and nowhere is the "look-out" keener than among the Scottish

agents. It has doubtless taken them some time to realise that it was possible to associate the new business with the old; but with the days of declining profits on cycles, the need of a new and vigorous allied industry has been pressed home with considerable force. The fact that well-known cycling enthusiasts, such as C. G. Wridgway, S. F. Edge, A. J. Wilson, J. W. Stocks, etc., had taken to the motor came at first as a shock, but it now appears to them quite a natural thing and what was to be expected; and many agents are making active preparations to meet the growing demand for motor-vehicles of various types. I would here offer one word of advice to cycle agents and others who may be contemplating taking up the motor trade, and it is this: You must be prepared by patient work to acquire a knowledge of the new business. A cycle is a comparatively simple piece of mechanism, easy enough to master. A motor-car of whatever type is a different matter; it is an engine as well as a cycle or carriage, as the case may be, and the engine, cycle, or carriage is not all. The engine will generate the power necessary to propel a vehicle, but a means of applying the power so generated is required, and this means the introduction of some form of transmission gear. One, therefore, at the outset has to make up his mind to master the more or less complicated mechanisms in addition to the ordinary details of a cycle and carriage. I do not wish it to be understood that this is a very serious thing to accomplish. I have, indeed, been surprised to see the success which some very unmechanical owners have with their motor-cars. What I wish to emphasise is that you must not expect, on getting delivery of a motor-car or motor-cycle from the makers, you will have immediate success in its management. You may have frequent disappointments until you have mastered the principles on which it is built and the methods of its construction, and you must make up your mind that there is a good deal to learn.

**Petrol Supply in Scotland.**

FOR the convenience of the increasing number of motorists in Scotland, or who may visit Scotland this summer, I append a list of the places where supplies of petrol may be procured.

The names with an asterisk are also repairers:—

|             |  |
|-------------|--|
| Glasgow.    | Peter Lee, 7 High Street.                          |
| *Hamilton.  | Stirling's Motor Carriages, Ltd., Campbell Street. |
| *Edinburgh. | Edinburgh Autocar Co., Abbeyhill.                  |
| *Do.        | Rossleigh Cycle and Motor Co., Ltd., York Place.   |
| Perth.      | A. S. McArthur, 30 Prince's Street.                |
| Dundee.     | Dundee and District Tramway Co., Lochee Depôt.     |
| *Aberdeen.  | Harpers' Motor Co., 33 Bridge Street.              |

"BROWN HEATHER."

**MOTOR-CARS ON THE CONTINENT.**

THE date of the fiacre competition approaches. Indeed, it is on the 2nd proximo that the tests of the vehicles are designed to commence. Two firms have already entered seven vehicles: Compagnie Internationale

de Transports Automobiles—(1) one cab, (2) one victoria, (3) one coupé, (4) one delivery carriage; Jeantaud—(5) one cab, (6) one coupé, (7) one mylord. This competition is open to (A) carriages for rural passenger services; (B) delivery carriages capable of conveying at least 500 kilos. of load; (C) delivery carriages capable of conveying at least 50 kilos. of useful load and driven by a single person.

**An Automobile Paper-Chase at Brussels.**

THE Belgian Motor-Car Club is organizing for decision during the early days of the month of June an automobile paper-chase, for which they expect a great number of entries. This form of sport is increasing on the Continent.

Good track layers furnish a fund of amusement by the intricacies of the courses outlined.

**Automobile Paper-Chase.**

THE *Vie au Grand Air* organized an automobile paper-chase, which was to be run off on May 21st, but owing to various circumstances it has been postponed until June 4th. The regulations are: (1.) The paper-chase contest is open to all the members of the Automobile Club de France, of the Rowing Club, and to the subscribers and guests of the *Vie au Grand Air*. (2.) There will be three classes with special prizes: (A) carriages, (B) motor-cycles, (C) carriages steered by a lady. (3.) The start will commence on Sunday, June 4th, at two o'clock exactly in the afternoon, at Fontainebleau. (4.) The course will be about 50 kilometres. (5.) Two control stations will be established on the run, and these will be indicated by green flags. At each of these stations the contestant will have to deliver one of the two tickets that are furnished him at the start. (6.) The carriage drivers of each class will have to bear distinctive coloured armlets. (7.) The finishing point will be indicated by a red flag. (8.) Any contestant starting before the starter's signal will be disqualified; for this purpose two observers will stand at 500 metres from the starting point. (9.) This paper-chase contest is under the presidency of M. le Caron de Zuylen; MM. A. Rignelle and de Morlhon will be the general observers. (10.) A *dejeuner* will be held at noon. (11.) The tracks will be indicated by pieces of red cardboard and bands of red paper stuck to the trees or walls (right-hand side). (12.) The entries will be closed on May 31st at midnight. (13.) The entries will be received at the *Vie au Grand Air*.

They must be accompanied with an entry fee of 3 francs, giving right to receive the *V.G.A.* during three months; the subscribers to the *V.G.A.* are free from the entry fee.

### The Contest for Amateur Chauffeurs

THIS contest was run off from Chaton to Beauvais and back, but has not carried off all the success expected. Out of thirty-five chauffeurs who entered only nine started, these being M.M. Gordon, Degré, de Neufelize, Werdeuseller, Champossin, Roge, Tampier, Chain and Lambert. The others were discouraged by the rain and the state of the roads. A great number of them, however, attended at the finishing point. Of the nine starters only Degré finished the course, but even he only succeeded after having changed his machine during the run, and as this was forbidden by the regulations the contest was abortive. All the other contestants were retarded by motor or tire accidents, so that no one machine successfully negotiated the course.

### Motor-Tricycle Records.

AT the Parc des Princes Vélodrome, Béconnais recently tried to beat the hour record on the track. He covered 10 kilometres in 10 min. 9½ s. (previous record, Béconnais, 10 m. 33 s.); 20 kilometres in 20 m. 29½ s. (previous record, Vigneaux, 21 m. 3 s.); 30 kilometres in 31 m. 7 s. (previous record, Vigneaux, 31 m. 14½ s.). The rain that had been falling for some time obliged the rider to give up the trial.

### Automobilism in the Herault Department.

THE motor-cycle race and automobile battle of flowers organized by the Société d'Agriculture de l'Herault on the occasion of its centenary promise to be carried out under the most brilliant auspices. The majority of the chauffeurs of the surrounding districts have already notified their desire to take part to the fête committee, and we learn that many are preparing gorgeous decorations for their vehicles.

### Tourcoing-Bethune Race.

THE Union Vélocipédique Tourquennoise has fixed July 3rd next as the date of its annual race, which includes an international motor-cycle class.

### Antwerp.

THE races organized by the Automobile Club of Antwerp on the occasion of the Cycle and Automobile Salon were run off attended by a numerous crowd both at the point of departure and on the road. The motor-cycle contest secured five starters and that of the carriages eight. The results are as follows:—

Carriages (45 kil.): 1, Baron de Crawhez, 1 h. 16 m. 26 s.; 2, Grégoire (of Brussels), 1 h. 35 m. 54 s.; 3, Daubrevey (of Brussels), 1 h. 47 m. 50 sec.; 4, Jos de Crawhez, 1 h. 49 m. 1 s.; 5, Tserclaes, 2 h. 22 m. 30 s.

Motor-cycles (75 kil.): 1, René Kuhling, 2 h. 20 m. 57 s.; 2, Rivierre, 2 h. 22 m. 23 s.; 3, Deroeck, 2 h. 59 m. 55 s.

After the race the prizes were distributed at the Salon du Cycle under the presidency of M. Ponthoz Van der Straeten, the President of the Automobile Club Belge. In the evening a banquet was held at the Hotel de Londres.

### A Belgian Challenge.

THE success that until now has attended the Belgian chauffeur, P. de Crawhez, has led him to throw down a challenge that is plucky but which is not by any means certain of fulfilment. The winner of the Brussels-Spa contest has offered to stake one hundred louis (£80) that he will cover the distance Brussels-Paris and back in

twenty-four hours' time. If he finds an acceptor, the attempt will take place in the early days of June, when the days are long and the break of day is early. M. de Crawhez has selected his route through the North of France; he has full confidence in his ability to successfully make the journey in the time, and has even promised that should he not succeed at the first attempt, he will try again until success attends his efforts. To be successful the Belgian chauffeur would have to keep up an average speed of thirty-four kilometres per hour during the whole twenty-four hours. This leaves very little margin for tire accidents, obtaining spirit supplies, and the like.

### The Paris-Zurich Record.

OUR Paris representative, M. Dick Farman, whom we previously announced was endeavouring to cut down the record between Paris and Zurich, has effected the 430 kilometres without any impediment, reaching the halting-places he had proposed every day.

### The Berlin Electrical Omnibuses.

A TRIAL of a new electrical omnibus has been carried out in Berlin. The course, about two miles in length, was from Reichstag Hall to the Charlottenburg, and the run occupied 25 minutes. The omnibus is driven by two motors, which work by means of cog-wheel gear on the hind wheels. The carriage, which is built like a tram-car, has twelve seats and standing room for six persons at the back. The front part is reserved for the sole use of the driver. The accumulators are fixed under the seat, and have a capacity sufficient for 20 kilometres. The carriage is steered by a lever, and is provided with a mechanical brake and an electric brake. The electric brake brings the carriage to a standstill in 1.5 metres space when going at full speed. The weight of the carriage is 3,500 kilograms. Its cost is about 15,000 marks.

### Paris-Bordeaux Race.

THE great Paris-Bordeaux race, which was over a distance of 565 kilometres, has been covered by Charron, the winner, within 11 h. 43 m. 20 s. In Bordeaux a large number of Parisian chauffeurs watched anxiously the signal of the first car's arrival. Out of seventy-four entrants, sixty-five took part in the contest. At 3 h. 15 m. 20 s. o'clock Charron (with a 12-h.p. car from Panhard & Levassor) arrived first in 11 h. 43 m. 20 s. M. René de Knyff came second at 3 h. 22 m. o'clock, having covered the distance within 11 h. 50 m. with a 12-h.p. car from Panhard & Levassor. Two accidents have been reported. One spectator at the corner of the Rue Chautiers at Versailles fell dead through fright at the terrible speed at which Charron had turned round the corner. At St. Cloud M. Lemaitre, the Nice champion, ran into the rear of the carriage of M. Gilles Hourgieres. M. Lemaitre's engineer was thrown over ten metres from the violence of the shock, and, of course, very seriously injured. Mons. Lemaitre was so painfully impressed by the accident that he preferred to give up the race. At the time of going to press the motor-cycle results had not reached us.

A RACE for motor cycles is to be included in the Harrogate Camp programme.

It is reported that the American rights of the Krieger electrical cab and other vehicles have been secured by the New York Autotruck Co.

THE New Coventry Cross Cycle Co., a reconstruction of the Coventry Cross Co., has taken powers to deal in and manufacture light motor-vehicles.

## PETROLEUM MOTOR-VEHICLES.\*

By JAMES D. ROOTS, M.I.M.E.

(Continued from p. 159.)

FIG. 14 is a section of this vertical oil motor. *A* is the cylinder, *B* piston, *C* crank, *D* balance weights, *E* taper on shaft to enable taper brasses to take up slack, *F* small toothed wheel, *G* toothed wheel having twice the number of teeth of wheel *F*, *H* eccentric with wheel *G*, *I* reciprocating rod carrying a rocket weight governor on the pin *J* for opening the exhaust valve *K*. The pin *K*<sub>1</sub> operates the lever

FIG. 14.

which reciprocates the usual oil feed spindle of the Roots oil engines. *L* is the admission valve, opening directly into the vaporiser. *M* is the casing containing the air-heater and vaporiser, having at its centre the ignition tube *N*, of nickel alloy or of platinum. The engine is started with an ordinary pressure burner, which is then put out, and the heat is maintained by an automatic burner fed by the engine, a portion of which is shown at *O*. A second groove is cut on the oil feed spindle, the oil from which is swept off by an air blast supplied from the closed crank-pit, the air and oil being mixed and vaporised in the pipe *O*, and directed upon the ignition tube *N*. *P* is the water-jacket.

Fig. 15 shows a pair of the motors illustrated in Fig. 14, fitted together to form one engine. This duplication formed an exceedingly simple, compact, and powerful engine, as it gave 5½ brake horse-power. Shortly after it was completed the author came to the conclusion that it was advisable to make all vehicle motors in future horizontal, and motors of this design were therefore not used for vehicles, but one of them drove a heavy launch on the river satisfactorily for some years.

Mr. J. H. Knight, in his "Notes on Motor-Carriages," says he commenced the construction of a petroleum-driven tricycle in the spring of 1895, and had it running in July that year with petroleum spirit, and that he afterwards fitted a vaporiser and ran it with petroleum oil. His little volume gives an illustration of this vehicle. The back wheels were 3 ft. in diameter, and the steering wheel 2 ft. 6 in., fitted with 1½-in. solid rubber. The total weight was about 5½ cwt.

A photograph of a car which the author understands was built by Daimler in 1895 is interesting, as showing a step in the process of development and improvement. It is also interesting as showing how two minds working upon the same problem quite independently may arrive at a very similar step in the process of development. It will be seen how similar in the construction of the frame and the steering arrangement this petro-car is to the one next described. It has been stated that water was used in the tubular frame, but the author has no evidence of this.

The second vehicle, constructed by Messrs. Roots and Venables in the summer of 1896, was also built largely on cycle lines, so far as regards

the steering arrangement and frame. The double tubular frame was carried round the vehicle from the cycle head on the one side to the cycle head on the other. The tubes were also of like gauge and diameter to that in use upon an ordinary bicycle, but they were doubled. The tubes were connected together by malleable iron joints brazed in position. The four wheels were of heavy cycle construction, having spokes ¾ in. thick, and fitted with pneumatic tires. The front wheels were fitted with ball bearings, while for the back wheels the ball bearings were on the axle. The body weighed 1 cwt. The water tank in front of the vehicle held ten gallons of water. The motor at the rear of the vehicle, which was mostly beneath the seat, was of 1½ brake horse-power. It used equally well American Tea Rose, Royal Daylight, or Russian oil, the Russoline brand. The total weight of the motor, including fly-wheel, was 140 lb.

FIG. 15.

As in all the vehicle motors of these makers' construction, the crank chamber formed an air-tight enclosure.

The essential working parts, the crank and piston, being completely protected from dust, it was not thought so essential in this vehicle to cover in the motor. A pump driven by the motor maintained a constant circulation of water round the jacket of the motor, through the tubular

FIG. 18.

frame of the vehicle on the one side to a water tank placed in front between the steering wheels, and back again to the motor by the frame tubes on the other side of the vehicle. The total weight of this motor-vehicle was 5 cwt. After running about 3,000 miles, it was superseded by another vehicle, having later improvements.

Fig. 18 shows the oil motor of this vehicle in part sectional plan. It was a horizontal single cylinder engine 4½ in. by 5 in., and at that time

\* A paper read before the Society of Engineers, May 1st, 1899.

gave only 1.65 brake horse-power. The author has since succeeded in getting 2.2 brake horse-power out of the same size of motor. *A* is the cylinder, *B* the connecting rod, *C* the crank shaft, *D* the crank chamber made air-tight, and in which the crank *C* runs in an oil bath. *D*<sub>1</sub> is a reservoir or chamber in which air is maintained under pressure. Very small air valves for suction and delivery are fitted to the crank chamber, so that the movement of the piston draws air into the crank chamber and delivers it under pressure to the chamber *D*<sub>1</sub>. An equable blast of air is maintained in this way through the pipe *J*<sub>4</sub>. This air blast has delivered to it a minute feed of oil by the oil feeder *J*, and the two are mixed together and heated inside the vaporiser to maintain a small blue flame of the blow-pipe order upon the platinum ignition tube *Z*<sub>2</sub>. This flame also heats the vaporiser *Z*. *Z*<sub>1</sub> is the burner used for starting, and is of the ordinary pressure or blow-lamp description.

*I*<sub>1</sub> is a chain wheel of twice the diameter and number of teeth of the chain wheel *I*<sub>2</sub>. *I*<sub>1</sub> is keyed to the valve counter-shaft *I*, and the chain wheel *I*<sub>2</sub> to the crank shaft. *H*<sub>2</sub> is an eccentric. *H*<sub>1</sub> a slide which reciprocates within the guide shown, and which operates the exhaust valve. The spindle of the exhaust valve fits within the guide. *K* is the governor, *K*<sub>1</sub> a link connecting the governor to the sleeve *K*<sub>2</sub>. *K*<sub>3</sub> is a lever moved by the governor, which slides on an intercepting piece *K*<sub>5</sub> behind the block or collar *K*<sub>6</sub>, fixed to the exhaust valve spindle. A small lever, not shown, is also oscillated by the block *K*<sub>6</sub>, to the upper end of which

FIG. 19.

lever is attached, by the links shown, the oil feeder *J*. The oil feed spindle *J* has two grooves cut in it, one of which measures and feeds oil to the vaporiser for the cylinder; the other, a very small one, performs the same office for the automatic burner. The air and oil, heated and intimately mixed together in the vaporiser *Z*, are then conveyed to the admission valve beneath the vaporiser.

This car was fitted with pneumatic tires; each tire was of 2½ in. diameter. The front wheels were 28 in. diameter, the back 32 in. These tires were an improvement upon the solid tires of the previous car in some respects. In the first place they never left the rim, and they ran smoothly over tram lines, however uneven the surface might be—i.e., whether the lines were above or below the ground surface; in fact, these tires appeared to take no notice whatever of grooves of this sort, and this is a very great advantage. They steered easily, gave very smooth running, and reduced vibration, not only that due to uneven road surface, but also that due to the motor. On the other hand there are the greater expense, increased side slip, continuous trouble with leakages of air pressure and the necessary re-pumping, and, lastly, the delays for patching the inner tube. The latter disadvantage only came into play after three or four months' use, when the car had probably done 2,000 miles. The second disadvantage was only noticeable upon certain conditions of road.

In February, 1897, the author was requested to exhibit the car at the Battersea Polytechnic. Nine Elms Lane is laid with stone setts and tram lines, with a delightful disregard of a plane surface. The road was very greasy, mud of the smooth, pasty order, and the author was a little late. There is a short hill at a narrow part of the lane, and he thought it a good opportunity for a quick run down. A tram-car, about twenty yards in front of the motor-car, suddenly pulled up at a narrow part and another vehicle closed the only passage. Although the author locked the back wheels the motor-car continued its way down the incline at only a slight angle with the line of motion, until the front-wheel tires gently collided with the back of the tram. The author has not had a puncture through the cover, but the inner tubes would never hold the pressure for a reasonable time, and the continuous trouble they give in their present stage of development outweighs whatever advantages they may possess on the other side of the balance.

The transmission gear of this car was altogether different to that of the tricycle before built, and of the carriage or petro-car. Two small flanged wood pulleys were keyed to the countershaft, and two large flanged wood pulleys were keyed to the axle tube, to which was also fixed at the other end the balance gear box. On the shorter arm of the hand operating lever were attached two small jockey pulleys, both running upon ball bearings. Both jockey pulleys being upon the same arm, and being placed between the upper lengths of the two belts, the extreme position of the jockey pulley in one direction tightened one strap, and the extreme position in the other direction tightened the other strap, while the intermediate position left both straps too loose to drive.

This car ran very satisfactorily except for the trouble given by the straps; they would stretch, break, and slip, slipping so much at times as to refuse to drive at all. The straps generally selected some spot where the traffic was thickest, and therefore it was most undesirable to have anything of the sort occur. They refused to drive in this way once when stopped by the traffic-regulating policeman in front of the Mansion House, and on another occasion at Piccadilly Circus. It was such occasions as these, particularly at this date (1896), when cars were so few, that gave the drivers of 'buses and cabs a golden opportunity for the display of that kind of sarcasm and humour in which they are such adepts, and they generally make use of the opportunity to the full.

Another method of arrangement of straps was also tried upon this vehicle, but the author's experience of them and their unreliability made him resolve never to use straps on a motor-vehicle again. In Fig. 19, which is an outline elevation showing the position of the parts, an oil tank is shown at the back of the seat over the motor. The vaporiser is bolted to the cylinder cover, and the water tank is in front of the car.

There are four distinct methods of arrangements of gear for steering a motor-vehicle. The first, which is the simplest, is that by means of a fork-steering head and handle, as in an ordinary bicycle or tricycle, as shown in Fig. 12, which is Messrs. Roots and Venables' earliest carriage with a single front steering wheel. Precisely the same principle is involved if the steering wheel be duplicated in the same vehicle and the two heads are connected together by a link, as shown in Fig. 19. The second method is the ordinary Ackerman steering, and which is now almost universally used for motor vehicles other than cycles. The third constructional method is that at present so widely used in horse-drawn vehicles, but without shafts and with some gearing added to render it controllable by the driver. The usual method of carrying this into effect is by fixing a quadrant or rack to the usual wheel plate and rotating the fore-carriage wheels on the perch-bolt in either direction by means of a pinion or screw gearing into the rack or quadrant. The fourth method of effecting the steering is much more unusual, and indeed rare. In fact, the author is under the impression that it possibly originated in one of his subsequently modified designs. It is to a certain extent a compromise between, or hybrid of, the first and second methods described, as there are the two steering heads connected by a link and operated by one handle combined, but minus the forks; each ball-bearing head is bolted to the swivelling arm of the Ackerman steering, except that the arm is forged with the axle bearing of the wheel, and the sleeve is forged with the axle. This method of steering was applied, shortly after the abortive *Engineer*

FIG. 21.

competition, to the four-seat car. It is, however, more costly, and complicated to make than the Ackerman method of steering. It was, nevertheless, very satisfactory in all other respects. The system, usual in ordinary carriages, of swivelling the whole axle and wheels upon a central or perch-bolt may serve well in electrical carriages, but the author is afraid with the vibration of a petroleum or steam car it would not be a satisfactory steering arrangement.

In many of the earlier attempts at producing a petroleum motor-vehicle, the steering was effected by means of a fork and head, similar to those of a bicycle or tricycle, following that line in which success had been most pronounced. It was generally assumed that this method of steering, so thoroughly tested and perfected for velocipedes, was the right method to employ for the motor-vehicle, especially those of light build and weight. Even now many new comers in the field of road locomotion adopt this method of steering, but having fully tested it for motor-vehicles, they generally, sooner or later, give it up for the Ackerman steering arrangement or some modified form of it.

Most of the early petroleum motor-vehicles were built with frames constructed of cycle steel tube, and more or less of the cycle method of construction. In the three-wheel vehicle which the author's firm constructed for the *Engineer* motor-vehicles competition at the Crystal Palace in June, 1897, the frame was of light steel tube. Fig. 21 is a line elevation showing the position of the parts. This car was the only petroleum motor-vehicle that ran to Birmingham on that occasion. The only other competing car which also ran was the Lifu steam van. The vehicle shown in Fig. 21 was designed and constructed by the author's firm in advance of the four-seat car following, but as they were both constructed for the *Engineer* competition, they were practically made simultaneously. The intention was to have had them both ready two months before the competition to enable them to be thoroughly tested. But they were not either of them really sufficiently ready at the time of the competition.

As will be seen there were two seats placed tandem. The centre line of the motor was coincident with that of the back wheel and in the same plane. The back wheel was the driving wheel, the two front were steerers in the manner shown by cycle heads and forks. The fly-wheel on the one side was balanced by a tank holding  $4\frac{1}{2}$  gallons of water placed upon the other side. The exhaust box or silencer was placed in a very prominent and unsightly position at the back of the frame behind the driving wheel. This would have been altered if there had been time before the date of the competition. The tank for the Tea Rose kerosene was placed just at the back of the driver. The steering was effected by a steel tube link forming the handle placed between the two riders, and which at each end was connected to the levers fixed to the top of the steering heads of the front wheels. The coil of copper pipe was fixed round the periphery of the fly-wheel, leaving about  $\frac{1}{2}$  in. between it and the coil. The centrifugal action of the rotating fly-wheel throws off sufficient air to make a very efficient water-cooler of the coil. A small pump circulates the water through the jacket, coil, and tank in the order named. The same horizontal motor was used upon this car as upon the previous one.

In the four-wheel motor vehicle having four seats, which the author's firm also entered for the *Engineer* motor-vehicles competition, the frame was built of cycle tubing throughout. The double tube was joined up at intervals round the sides of the frame by means of malleable iron castings, and all the joints and connections were made in this way. The object, of course, in using the tube is to make the frame light and generally save weight, but in all those cases in which the makers have tried it up to the present, this object, owing to the great weight of the malleable iron joints, has not been attained. Indeed, the weight of the frame finished has always been rather greater than it would have been by using angle or channel iron or steel. This latter—viz., channel—is the section they have adopted, and will continue to use in all their vehicles, until such time as the industry becomes so advanced that they are able to purchase ready-made frames in steel tube. There is, however, one great advantage in the use of steel tube which must not be overlooked, and that is, being able to utilise the frame for the conveyance, and therefore cooling, of the water from the motor jacket to the water tank, and this the author believes was first mentioned in his specification No. 23,786, of 1892.

(To be continued.)

J. G. STONE, U.S. Consul-General at Cape Town, South Africa, writes that several English and French motor-vehicles are in use there for pleasure and for carrying the mails. He wishes to buy a motor-carriage himself.

On the 22nd inst, Eliza O'Neill, a servant in the employ of Mrs. Jury, of Greenfield, Stillorgan Road, Dublin, was knocked down at Merrion, by a motor-car, the property of Mr. M'Taggart, of Deepwell, Blackrock. Miss O'Neill received injuries which necessitated her removal to Monks-town Hospital.

THE Mark Cross magistrates on the 23rd inst. imposed a fine of £7 10s. and costs upon Mr. George Arnold, of Tunbridge Well, who was one of the pioneers in the use of motor cars, for not stopping a motor-car he was driving at Mayfield, when signalled to do so by a lady and gentleman who were driving restive horses. A further charge of travelling at too great a speed was dismissed.

IN answer to an enquiry made by the French Government as to the duty on horseless carriages or automobiles or parts thereof imported into the United States, the United States Treasury Department has replied that "such horseless carriages or automobiles will be subject to duty on importation at the rate of 45 per cent. ad valorem as articles or wares composed wholly or in part of metal, under paragraph 193 of the Act of July 24th, 1897."

THE London Auto-Car Co., Ltd., of Gray's Inn Road, W.C., has issued a retail price list of motor accessories, spare parts and sundries which does infinite credit, to its enterprise, surpassing as it does any of the lists of the larger companies, by whom indeed it might well be taken as a model. Practically every accessory and spare part in connection with the Daimler and Panhard cars, the Beeston and De Dion tricycles, Hurtu and Benz cars, and Bollée voituresses are included. Some idea of the completeness of the list can be gained from the fact that the catalogue of parts and accessories of the Beeston and De Dion tricycles fills five complete pages. From a cursory examination, the prices appear to be moderate, and the Company is to be congratulated on having produced so satisfactory a list, which it will no doubt improve upon and increase as time goes on.

## SOME AMERICAN STEAM-DRIVEN MOTOR-VEHICLES.

By HORACE L. ARNOLD.

(Continued from page 174.)

As motor-vehicle engineers will readily understand, a pair of  $2\frac{1}{2}$ -in. steam pistons with 140 or 150 lb. of steam behind them can handle this 400 lb. carriage with 300 lb. load with ease. The wheels are all alike, tangent spokes, and 2-in. tandem tires, 28-in. nominal diameter, really 29 ins.; the gauge is 52 in., and the wheel base is 62 in. The wheels have Fairbank's laminated wood rims, and the tires, by the Hartford Rubber Co., cost only 12 dols. per set of four, which is quite a different figure from the 200 dols. per set of four tires demanded for the electric or storage battery carriages.

To start from cold water the gasoline vaporizing tube must first be heated with a hand gasoline torch until vaporised gasoline fills the burner; this takes  $1\frac{1}{2}$  minutes. The fire lights itself from the hand torch so soon as the vapour begins to flow into the burner, and in three minutes more the steam gauge will show 25 lb., which will handle the carriage with ease. The extreme speed is about twenty-five miles per hour with two passengers up.

On the road, hills are not noticed at all by this wagon. On a 10 per cent. grade, with Stanley and the writer on board, the car was stopped with the rear wheels in a depression deep enough to hold the car quite still without the use of the brake. The steam gauge showed 140 lb., and the car started with a jump when the throttle was opened, and accelerated to fifteen miles per hour in travelling 100 ft., which reached the top of the grade.

The exhaust is carried up over the top tube sheet of the boiler, and inside a rearward horizontal extension of the smoke bonnet to a downwardly opening smoke stack, through which the products of combustion are discharged by the action of the exhaust steam, which shows only a very little, or not at all in warm weather, and forms only a mere wreath of vapour in the trail of the carriage when most visible. The fire makes no roaring, a kind of humming noise being audible if listened for close to the fire box, but not otherwise. The engine and chain are noiseless also. The exhaust is distinctly audible, but no horse met in the course of a somewhat extended drive on a country road paid any attention to the Stanley car, and the same was true of the Whitney car, only one solitary horse in the course of several hours' run through the streets of Boston and vicinity being noticeably agitated by our appearance, although hundreds were met and passed. This leads to the conclusion that it is the outline of the vehicle which frightens the horse, as the Stanley and Whitney cars are almost exactly like ordinary American carriages for two persons.

At the extreme rear of the Stanley carriage body there is a very short vertical uptake, communicating freely with the smoke bonnet, which passes the products of combustion upward when the engines are not working. The fire regulator acts in one or two seconds, so that there is seldom much fire burning when the engines are not using steam. In fact, the whole automatic regulation of this Stanley boiler is so perfect as to demand no attention whatever from the driver, who has merely to move the throttle lever with his right hand to obtain the speed he wishes. The brake is operated by a treadle, and the steering is very light and easy. Stanley often releases the steering lever altogether, which, however, cannot be regarded as a safe and proper procedure at any time, any more than it would be proper to drop the reins when driving spirited horses; in fact, it is really much less proper, because the horse when not frightened out of his senses will usually keep the road of his own accord, while a motor-car is liable to "shy" if one of the front wheels meets an obstruction.

Two gauges are provided on the inside of the Stanley dash-board, one for the steam pressure, and one for the

air pressure in the gasoline tank, which is kept up by a hand pump.

With 8 inches of water in the boiler and 12 gallons of water in the water tank, the Stanley car can run about forty miles without taking more water, and the carriage regularly runs twenty-five miles with a gallon of gasoline, which is only about what the best explosion engine-driven carriages require. How it is possible to obtain such a fuel economy with steam propulsion is not quite clear. Probably the clean fire and clean boiler tubes, of only a little more than paper thickness, account for this performance when the fact of absolutely perfect combustion is remembered.

FIG. 7.—MR. MASON IN HIS STEAM CARRIAGE.

The writer fully believes that, on fair roads, the Stanley steam car is equal at all points to anything in the way of an automobile ever shown, and as it emits no offensive odour, makes no appreciable noise, and does not frighten horses, and leaves the driver more liberty than he can have when guiding a quick horse, it appears that Stanley has really succeeded in producing a wholly unobjectionable steam-driven carriage.

FIG. 8.—MASON'S ENGINES—VIEW FROM RIGHT.

This is a step in advance, if true, and must lead to the large use of these carriages as soon as they can be had at the price of 600 dols., as is proposed by the Stanley Brothers.

Fig. 7 shows Mr. Mason in his beautiful little steam car, which has the Stanley boiler and burner and the Mason regulator and the Stanley frame and wheels and steering level. As Mason uses piston valves and a link valve motion, he has three levers on his quadrant stand at the right of the

seat, the outside one for the cylinder cocks, the middle one for the link motion, and the inside one, latching to a very finely notched short quadrant, for the throttle valve lever. Mason drives with the same chain used by Stanley, but his engines are smaller, being only 2 in. bore with 3 in. stroke, and he uses a lower gear, with an 8-teeth sprocket on the engine shaft, and a 32-teeth sprocket on the compensation casing, which produces a 4 to 1 reduction.

Mason's wheels are 29 in. diameter, of the same construction as Stanley's, having ball bearing hubs. The car has a 50 $\frac{3}{4}$ -in. gauge, and 56-in. wheel base.

While the Mason car is not precisely identical with Stanley's, the two are so similar that the numerous illustrations of the Mason car are generally applicable to the Stanley car.

Mason uses a 12-lb. fly-wheel on his engine shaft, with a view to equalising the motion when the links are "hooked-up short"; this fly-wheel is plainly shown in Figs. 8, 13, and 14. Experiment only can determine the advantages of this fly-wheel.

(To be continued.)

THE Canford Cliffs Motor-Omnibus Co., Ltd., was registered on May 12th by R. L. Butler, 70 Mark Lane, E.C., with a capital of £2,000 in £1 shares, the object being to maintain and work a line of motor-cars or omnibuses to and from the Canford Cliffs Estate, Poole, Dorset.

SUNDRY motor-car breakdowns have taken place of late on the Brighton Road. A novel sight was presented the other day by W. Fagg and a friend on a tandem safety towing a disabled car, weighing some 5 cwt., with the owner up, a distance of twelve miles to a harbour of repair.

MESSRS. ROUGH, of Hereford, have constructed an automobile in which the transmission of power is by means of friction gear, and the speeds are four and ten miles per hour. The motor is 2 h.p. and the carriage is designed to carry two persons, and is said to weigh 4 $\frac{1}{2}$  cwt. The vehicle is only an experimental one.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, JUNE 2nd, 1899.

[No. 13.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### The Alleged Breakdowns of Electrical Cabs.

IN our last week's issue we published an extract from a morning contemporary which alleged that seven of the London Electrical Cab Co.'s vehicles were brought to a standstill in Farringdon Street owing to breakdowns on the occasion of the inaugural run of the vehicles on Wednesday in last week. From a letter which appears in another column it will be seen that Mr. Walter C. Bersey, the Chairman and Managing Director of the Company, categorically denies that the breakdowns occurred as alleged. It is a great pity that our contemporary should have admitted the statements to its columns without some verification; we know from experience that this is frequently a difficult task, but a contributor who so thoroughly drags his paper in the mire by contributing reports of purely imaginary events and dishing them up as sober facts is utterly unworthy of further employment. As we remarked last week, none of the breakdowns were alleged to be due to mechanical faults or derangements, but, as reported, were supposedly due to the want of skill of the drivers. In conversation with Mr. Bersey on Tuesday last we discovered that this matter of securing the services of properly trained drivers is at the present time exercising the Company's mind considerably, and materially affecting its prospects. In regard to drivers for unlicensed vehicles, those let out on private hire, there is no difficulty. All the trouble arises with licensed cabdrivers. Many have sought to lay down such conditions of employment as entirely preclude their acceptance, whilst others, knowing that the season is now at its height, prefer to keep to horse-drawn vehicles during the fine weather, quietly intimating that when the season is over they will take up the electric cab again. The "downiness" of the London cabman has become proverbial; indeed a police official recently informed the writer that as a body the police would much prefer dealing with known bad characters than with the almost equally troublesome and even more artful London cabman. Mr. Bersey's experience with them is a terrible one. He told us the other day that one driver had travelled forty miles, as ascertained by the meters of his vehicle, and yet he had the impudence to tender 4s. as his day's takings! The Taximeter Syndicate are finding equal trouble with the cabmen they employ. They use all manner of tricks to upset the mechanism of the register, and generally seek to "bluff" the Company when these tricks are unavailing.

### The Control of Motor Racing.

IN another column of the present issue there appears a moderate and thoughtful letter from the Hon. Secretary of the Motor-Car Club in regard to the control of motor vehicle racing and the ill-advised course taken by one motor-car organization in regard to its effort to control this sport without studying the wishes of participants or seeking to make its rules acceptable to those outside the confines of its own membership. We trust that the Automobile Club will reconsider its position in this matter, and recognise

that it is not possible for even the strongest body to control those who for various reasons have no desire to be admitted to the select ranks of its membership even did its election committee permit their admission. A correspondent has pointed out the anomalous position of the Automobile Club in asking "those interested to forward suggestions" to the committee for framing the rules controlling motor racing. Apart altogether from the admission of weakness implied in the making of such a proposal, our correspondent points out that were "those interested" to follow the request it would result in their having to submit a complete code of rules. If the Automobile Club wants suggestions, it is obvious that the only proper way to obtain them would be to publish the Club's suggested rules and then ask "those interested" for suggestions.

### The Trials of Heavy Vehicles at Liverpool.

YESTERDAY was the last day for receiving entries for the trials of heavy motor-vehicles in August next at Liverpool, but the Liverpool branch of the Self-Propelled Traffic Association, who, in conjunction with the Royal Lancashire Agricultural Society, are responsible for the inauguration of these trials, will no doubt give every consideration to those entries that may arrive after that date, owing to inadvertence. The trials will be conducted over a route of thirty to forty miles in length in the neighbourhood of Liverpool, and as Mr. E. Shrapnell Smith is mainly responsible for the arrangements it may safely be concluded that they will be excellent and complete in every detail, as was the case last year. No one who has not taken part in the inauguration of similar trials can form any conception of the vast amount of labour involved, and we trust that those who have not yet sent in their adhesions will delay no longer, and thus in some measure lighten the task of the hon. secretary and council of the Liverpool S.-P.T.A.

### "Movements" in the Motor-Car World.

THE present time is certainly a period of "movement" in the motor-car world, and in almost every section changes are taking place in the *personnel* of most of the more prominent trading bodies. We recorded the other day that Mr. Instone had resigned the secretaryship of the Daimler Co., whilst it is a well-known fact that one of the directors of that Company has also seen fit to separate himself from his colleagues on the directorate. The chief clerk of the company has also resigned and taken up other employment, whilst Mr. A. H. D. Altree, the Company's commercial manager, is the latest to sever his connection with the Daimler Co. We recently recorded the resignation of one of the Motor Manufacturing Co.'s chief mechanics, and this is now followed by the resignation of the chief of the Company's sale branch, Mr. Percy Richardson severing his connection with the Company to-morrow. In regard to the secretaryship of the Daimler Company, this position has been filled by the appointment of Mr. J. Ware, whose selection dates some weeks back, and who is by this time thoroughly at home in his new sphere. Mr. A. H. D. Altree

is starting in business for himself as an agent for motor-vehicles, and also as the vendor of a solid tire of which he has a very high opinion. These "Dara" tires will furnish the trading name of Mr. Altree's firm, its title being the Dara Tire Co., whilst its present offices are at Piccadilly Mansions, Shaftesbury Avenue, W.C., quite close to Piccadilly Circus. Mr. Altree's old position with the Daimler Company appears to be divided now into two distinct portions; the management of the London show-rooms is entrusted to Mr. Pedley, who has for some long time been connected with the London Motor-Van and Wagon Company, whilst Mr. Percy Richardson, late of the Motor Manufacturing Company, becomes the chief outdoor representative of the Daimler Company, and takes over the superintendence of agents, etc. We wish all these gentlemen success in their new spheres; most of them are personally known to us, and we can speak confidently of their business abilities and general capacity for conducting commercial duties.

#### The New Brighton and Seacombe Motor-Car Service.

MR. W. MILLER-METCALF has been good enough to send us a photograph representing the first car-load of passengers carried on the inaugural trip of the New Brighton and Seacombe motor-car service; but this unfortunately arrived too late for reproduction in the present issue. The first public journey was commenced at 2.30 on Saturday last, and the first car-load of passengers consisted of a troupe of niggers who were conveyed from New Brighton to Seacombe. The inauguration of such a service with such a load of passengers naturally created some amount of excitement, more especially as during the whole journey the minstrels gave selections from their extensive repertoire. Mr. Miller-Metcalf, who is the leading spirit in the Liverpool and New Brighton motor-vehicle services, drove the car himself on its first journey, and had "quite a lively time" with his first load. The car, carrying nine persons, filled completely on every journey, and accomplished the run between New Brighton and Seacombe (2½ miles) in from ten to twelve minutes, according to the state of the traffic. The horsed omnibuses take between twenty-five minutes and half an hour to cover the same distance; so that there is no cause for wonder that the motor-char-a-bancs was well patronised. A conversation held between some of the 'bus drivers was overheard very late on Saturday night, and proved very amusing. Said one Jehu, "I thought the beggar was into me half a dozen times." Said another, "What puzzles me is how he gets in and out of the traffic in such a way as he does." Another remarked, "What I can't understand is the motor-car, leaving at the same time as I did with a full load, passing me on its return journey almost before I got half-way on my outward one. I began to think it was only going half-way, but I jolly soon found out it wasn't when I tried to keep up with it on one trip." In the result it was acknowledged that directly more cars are put on the service so soon would the 'bus drivers' occupation be gone; and another result is that Mr. Metcalf has received numerous applications to be "taught to drive them handy motor-cars."

#### A Speed Indicator and Chronograph.

WE have received from Mr. Robt. S. Roberts particulars of an extremely ingenious apparatus which shows instantly and automatically the rate of speed attained by a vehicle over any given distance. It does not record the distance traversed but only the rate of speed per hour over a known distance or during a given interval of time. No calculations of any kind are required to ascertain results. It is a case of "you push the button" and the instrument "does the rest." All that is necessary is that on passing a milestone the chronograph must be started by pushing the button; on passing the next milestone push the button again to stop the chronograph. If the speed is under sixteen miles per hour the result is

automatically recorded on the front dial, a small hand pointing to red figures giving the speed per hour. If the speed is greater than fifteen miles per hour a special dial is employed on which the figures are given in different colours. A small hand refers to the colour in which the figures covered by the large hand are to be read, the large hand covering four rows of figures, each row being of a different colour. The figure covered by the large hand in the colour designated by the small hand gives the speed per hour. Mr. Roberts has very kindly offered to place one of these instruments called "The 'Mensor' Speed Indicator Chronograph" at our disposal for testing purposes. We have accepted the offer and will acquaint our readers with our experiences with this ingenious instrument.

The Judd-Comiskey Motor Vehicle Co., of New York City, has been formed to manufacture and deal in motors and vehicles; it has a capital of £20,000.

THE Crouch Automobile Manufacturing Transportation Co., of Baltimore, with a capital of £50,000, has been incorporated in Maryland, U.S.A.

MR. O. SIMPSON, of 94 Denmark Street, Lowestoft, will be pleased to supply any motor-carists passing through the town with petrol, tubes, etc., and will do anything he can to advance them on their journey.

MR. HENRY STURMEY is resigning his directorship of the Daimler Motor Company, whose affairs, he states, are in a chaotic condition. He complains that he has no voice in their direction.

MR. J. JOHNSON, agricultural engineer, Market Place, Hexham, is taking up the manufacture of motor-vehicles, and is building new works in order to have greater facilities for this branch of his business.

MR. HANS RENOLD, whose patent silent-running chain has given great satisfaction to some motor-car makers but not to others, will shortly bring out a new motor-car chain, which he believes will meet all the requirements of a motor-vehicle.

WE have already announced the commencement of the running of electrical cabs in the Austrian capital, and they are so successful that they will shortly number fifty. They are of the same type and pattern as those which are at present running in London and in Paris, being built on the Bersey and Brougham patents.

A CURIOUS hippodrome race is reported to have taken place recently at New York. The competitors consisted of a bicyclist, a motor-car, an elephant, a camel, and a racehorse. The distance was one mile, and the elephant, getting in front at the start, occupied the whole of the course, and so won the race, although the time recorded—six minutes—cannot be regarded as fast, even for an elephant.

THE French accumulator competition has been postponed for a few days owing to the delay in the delivery of the electrical testing machines at the Automobile Club. The apparatus is being set up in the cellars of the club house, the Place de la Concorde, where they will work under the supervision of M. Forestier. We shall let our readers know the results.

MR. HOPWOOD, the Recorder of Liverpool, had an exciting experience in Fleet Street the other day. It was just opposite the entrance to the Middle Temple, and the learned gentleman was in the middle of the crowded thoroughfare. Dodging an omnibus coming in one direction, he was unaware of the fact that Messrs. W. H. Smith's "Lifu" van was proceeding in the other direction until the burr arising from its progress made him aware of it. He could not go back and he could not go on. Mr. Hopwood just measured the distance between the two vehicles and braced himself in the happy mean until they passed. But it was a narrow shave, which, with a little flutter or flurry, might have resulted otherwise.

# The Paris-Bordeaux Race.

MONSIEUR CHARRON, THE WINNER, IN HIS PANHARD CAR AT THE CONCLUSION OF THE RACE AT BORDEAUX.

THE second occasion of this long distance race over 565 kilometres (351 miles) of rather difficult country proved even more successful than the inaugural event. Of the large number of entries there were only nine defaulters at the time of starting, which was fixed for the unearthly hour of 3 o'clock a.m. As we briefly announced in our last issue Monsieur T. Charron proved the winner, his time being 11 h. 43 m. 10 s., whilst in the motor-tricycle class Bardin was successful in 13 h. 22 m. It was anticipated by the "prophets" that on the present occasion the average speed of the winner would be 50 kilometres per hour, Monsieur René de Knyff's record last year being 37 kilometres, 690 metres. Although M. Charron the winner on the present occasion beat M. René de Knyff's time (15 h. 15 m. 31½ s.) by over 3½ h., yet this huge advance was not sufficient to make the average 50 kilometres per hour. As a matter of fact the average speed was 47 kilometres per hour in round figures, or, say 29 English miles per hour. The conditions were none too favourable, as a strong head or cross wind was blowing the whole time, and during the latter part of the journey rain descended "in sheets," to use colloquial language. If the climatic conditions had been more favourable probably the speed would have reached the figures prophesied.

In the motor-cycle division the winner's average speed over the whole journey was 42 kilometres 230 metres, the 1½-h.p. engine, assisted up the gradients by pedalling, being only 6 kilometres (say 3½ miles) per hour slower than the 12-h.p. (nominal) engine fitted to the winning car. Of course, the dead load is very much less in the one case than in the other ;

but at the same time, this comparison leads one to form an opinion of the magnificent work put into these small motors by De Dion & Bouton.

Fortunately we are not likely to see such contests in England just yet, for although we acknowledge that from a sporting point of view it is interesting and indeed exciting to watch such contests, yet to our minds the dangers arising from such a high rate of speed over ordinary roads and through towns and villages is nothing less than ridiculous from an utilitarian point of view. Such speeds will never be permitted as an ordinary thing in any country in the world ; the risks and danger, not only to the competitors themselves but also to the members of the ordinary public, are much too terrible.

As it was, several severe accidents are reported, and although the French enthusiasts point out that these occurred through uneven level-crossings over railway lines, and through defects in the roadway, yet there were several other collisions of which nothing is heard publicly.

Long before the hour appointed for the start, all Paris, or all the sporting population of Paris, turned out to make their way to Suresnes. It is not many events that would draw out the inhabitants of Paris, or any other great city, to spend the night and early morning watching the gathering crowds and the gradually increasing number of impatient contestants. Yet, during the whole night in the automobile and cycling centre of Paris, the Avenue de la Grand Armée and Suresnes afforded a curious and exceedingly animated sight. All the neighbouring cafés and especially the Chalet du Cycle were crammed with people, and even as early as 2 o'clock a.m.

more than 4,000 persons were gathered at the starting point. Hundreds of bicycles and over 150 motor-cars were present, and the scene was really extraordinary.

As the starting time grew nearer the crowds increased and the rattle of vehicles of all descriptions grew greater and greater. The roads of the Bois were furrowed in every direction, and the darkness of the night was made plain by the numbers of gleaming acetylene lamps. As 3 o'clock approached all the best known people of the automobile world of Paris were gathered round the starting point. Occasionally a gleam like a lightning flash in miniature threw some group into bold relief, whilst making the surrounding darkness more intense. Photographers by the score were flashing magnesium lights in order to secure pictorial records of the scene.

To watch the competitors waiting for the start was a sight in itself: some so nervous and excited that it was

MONSIEUR RENÉ DE KNYFF TURNING A CORNER AT ORLEANS AT FORTY MILES PER HOUR. EXPOSURE OF LENS  $\frac{1}{250}$  SEC. THE GENDARME ON THE LEFT WITH WHITE GLOVE IS INDICATING THE ROUTE.

impossible for them to keep their seats; others engaged in providing food for the journey; others, again, engaged in a last examination of their machines; whilst others anxiously approached their supporters, seeking to gain another assurance that arrangements had been made at various points to supply them with petrol, with food, or with other comforts. Some were so overloaded with petrol that it was difficult for them to sit in their seats, others paid such attention to the commissariat department that they appeared to be preparing rather for a bountiful picnic than for a night race through France.

At 2 o'clock the distinguishing armlets were given out to the competitors, and the leaden seal attached to the tricycles for identification purposes, it being forbidden to change machines during the contest. These interesting details were carried out by the aid of a lighted candle! Then, some of the curious and interested spectators climbed up Suresnes Hill to catch the first glimpse of the competition.

At 3.12 a.m. the starters in the motor-tricycle class were ready to start, their names being as follows:—

51. Ducom, Paris.
52. Ajax, Paris.

53. Marcellin, Paris.
54. Osmont, Paris.
55. Vasseur, Paris.
56. Rigal, Paris.
57. Béconnais, Paris.
58. Ernest Roguet, Paris.
59. Gaëtan de Méaulne, Paris.
60. S. F. Edge, London.
61. Teste, Paris.
62. Bardin, Paris.
63. Chas. Jarrott, London.
64. Williams, Paris.
65. Marriott, Paris.
66. Bugatti, Milan.
67. Carrot, Saint-Etienne.
69. Georges Celos, Paris.
70. Gleizes, Neuilly.
71. Rolland, Paris.
72. Gasté, Paris.
73. Duval, Paris.
74. Géo, Paris.
75. Corre, Levallois.
76. Siolliac, Paris.
77. Renaux, Paris.
78. Bar, Paris.
79. Tart, Paris.
80. Soncin, Paris.
83. Nicolas, Paris.
85. Degrais, Paris.
86. Degré, Paris.
87. Vigneaux, Paris.
88. Searle, Paris.
89. Théodore, Paris.
90. Duanip, Libourne.
91. Comiot, Paris.

MONSIEUR GIRAUD'S CAR AT VENDOME AFTER THE ACCIDENT.

By this time the dawn had begun to appear, and the lights of the vehicles were gradually put out, the operation being critically watched by the onlookers.

At 3.13 a.m. exactly the signal was given and the whole thirty-seven competitors stood on their pedals and were almost immediately swallowed up in a cloud of dusty vapour. Béconnais and Osmond took the lead, but soon they were beyond vision, and those at the starting point resigned themselves to waiting for telegrams to learn how the race proceeded, solacing themselves with the thought that they had assisted in the starting of a notable event.

At 3.32 a.m. all the motors of the large cars were started, and immediately the twenty-eight vehicles were swallowed up in a cloud of evil-smelling dust. The competitors in this class were as follows:—

- |                    |          |          |
|--------------------|----------|----------|
| 1. Etienne Giraud  | carriage | 18½ h.p. |
| 2. F. Charron      | "        | 12 "     |
| 3. Léonce Girardot | "        | 12 "     |

|                                       |            |          |
|---------------------------------------|------------|----------|

| 31. Baehni                            | "          | 8 "      |
| 32. Wilfrid                           | voiturette | 4 "      |

Before giving the actual times of passing the various checking or control stations it will be interesting to note how the race proceeded in general. Briefly, it may be said that the victory, so far as the type of vehicles are concerned, rests entirely with Panhard and Levassor, the first five cars being of this type, as well as the 7th, 8th, 9th, 12th and 13th, the 5th and 10th being Mors vehicles. Three Peugeot cars of 18 h.p. started, but all were incapacitated owing to accidents, none of which were due to mechanical faults in construction. The Peugeot vehicle of 10 h.p. finished 11th, and in addition to those previously mentioned Mors cars secured the 14th and 16th positions, whilst one of the Amédée Bollée vehicles was 15th—over four hours behind the winner.

MM. Giraud, Leys, Charron and Gilles Hourgières are the four chauffeurs who in turn occupied the premier position at different control stations. M. Giraud was leading up to Chartres; Charron and de Knyff followed each other at a few minutes interval during the whole course from Chateaudun to Ruffec, whilst M. Gilles Hourgières passed them at this latter town and arrived first at Angoulême two minutes in advance. At Barbezieux, Charron finally took the lead, his luck being in the ascendant when Gilles Hourgières stopped for a few minutes owing to a temporary breakdown.

The wind was blowing very hard and greatly disturbed the racers, and a little before reaching Barbezieux those leading were wetted through to the skin and covered with mud, owing to a violent storm.

In the motor-cyclist series, Bardin, an old racer used to every professional craftiness, did not trouble himself to take the lead at too early a point. He worked his machine without any breakdown up to within fifty mètres from the finishing point, when he was obliged to travel by pushing his tricycle, this being his only stoppage. He took the lead at Tours, and constantly increased his advantage, arriving fifth in the general classification (beating Hourgières by two seconds) and being first in his own division.

The contestants passed in the following order at the principal controlling stations:

Vendôme (169 kil.)—Motor-cycles: Williams, 6 h. 44 m. Bardin, 6 h. 46 m.; Duanip, 6 h. 48 m.; de Méaulne, 6 h. 59 m.; Rigal, 7 h. 4 m.; Teste, 7 h. 7 m.; Ducom, 7 h. 11 m.; Jarrott and Corre, 7 h. 14 m. Motor-cars: Leys and Charron (together), 6 h. 48 m.; R. de Knyff, 6 h. 59 m.; Giraud, 7 h.; Girardot, 7 h. 8 m.; Archambault and Hourgières, 7 h. 11 m.; Voligt, 7 h. 26 m.

Just after passing through Tours, the motor-cars overtook the first motor-cycle. Bardin passed Tours at 7 h. 56 m., and Charron at 7 h. 59 m. Charron was "pulled over the coals" here for furious speed when passing through the town.

Poitiers (330 kil.)—Motor-cars: Charron, 9 h. 57 m.; de Knyff, 10 h. 9 m.; Gilles Hourgières, 10 h. 11 m.; Leys, 10 h. 22 m.; Archambault, 10 h. 24 m. Motor-cycles:

Bardin, 10 h. 15 m.; Williams, 10 h. 28 m.; Bugatti, 10 h. 37 m.; Teste, 10 h. 45 m.; Gaëtan de Méaulne, 10 h. 49 m.; Vasseur, 11 h. 4 m.

Angoulême (438 kil.)—Motor-cars: Gilles Hourgières, 12 h. 21 m.; René de Knyff, 12 h. 23 m.; Charron, 12 h. 28 m.; Archambault, who took a wrong turn in the town, was obliged to turn back. He started at 1 h. 9 m.; Girardot arrived at 1 h. 13 m.; Antony, 1 h. 55 m. Motor-cycles: The first motor-cyclist, Bardin, passed at 12 h. 54 m.; Teste came next a long time after, at 1 h. 26 m.; de Méaulne, 1 h. 35 m.; Williams, 1 h. 50 m.; Vasseur, 3 h. 5 m.

At Bordeaux, at the Quatre-Pavillons, there was a considerable crowd, amongst those present being MM. Joseph and Henri Journu, Marquis de Fayolle, Baron de Zuylen, Comte de Dion, Escarraguel, Georges Thomas, André Michelin, Armand Peugeot, Bard, Henri Lafitte, Joseph Clouzet, Maurice Lamulue, Marquis du Vivier, Gondoin, Herard, Creuzan (father and son), Thoumazeau, Louis Busquet, Pierre Schroder, Guestier, Noé Boyer, Oury, Barbereau, Prat-Dumas, De Thomines, Toulouse, Emile Mas, Pistres, and Bourges.

The storm of rain and wind was dreadful, but no one thought of seeking shelter. At a quarter past three the first car arrived, it proving to be Charron's under a thick layer of dust and mud. He arrived at exactly 3 h. 15 m. 29 s.; eight minutes afterwards René de Knyff arrived, and the others succeeded one another at intervals.

The following are the times of the arrivals:—

#### MOTOR-CARS.

1. Charron, 3 h. 15 m. 20 s.
2. R. de Knyff, 3 h. 23 m. 26 s.
3. Girardot, 4 h. 4 m. 35 s.
4. Archambault, 4 h. 9 m. 45 s.
5. Hourgières, 4 h. 35 m. 44 s.
6. Antony, 4 h. 49 m. 43 s.
7. Leys, 5 h. 4 m. 5 s.
8. Voigt, 5 h. 21 m. 11 s.
9. M. Farman, 6 h. 12 m. 32 s.
10. Broc, 6 h. 51 m. 48 s.
11. G. de Knyff, 6 h. 55 m. 25 s.
12. Huguet, 6 h. 57 m.
13. Hénon, 7 h. 20 m. 16 s.
14. Levegh, 7 h. 23 m. 26 s.
15. De Castelnau, 7 h. 24 m. 6 s.
16. Tougerat, 8 h. 5 m. 40 s.

#### MOTOR-CYCLES

1. Bardin, 4 h. 35 m. 42 s.
2. Teste, 4 h. 42 m. 3 s.
3. Méaulne, 4 h. 57 m. 35 s.
4. Vasseur, 6 h. 9 m. 35 s.
5. Degrais, 7 h. 5 m.
6. Gasté, 7 h. 19 m. 6 s.
7. Gleizes, 7 h. 32 m. 35 s.
8. Tart, 8 h. 10 m.
9. Degré, 8 h. 32 m. 35 s.
10. Rolland, 8 h. 40 m. 32 s.
11. Béconnais, 9 h. 35 m. 10 s.

The first and only serious accident occurred on the St. Cloud Hill, close to the starting point. M. Lemaître was behind M. Gilles Hourgières and quite close on him whilst they were passing the level crossing over the railway line which exists at the bottom of the hill. At that very moment a pneumatic tire of the front wheel of M. Hourgières' car burst, so that he was obliged to put on the brake suddenly. M. Lemaître, in order to avoid a collision with M. Hourgières' car, turned off suddenly and put on the brake. His "mecanicien," seeing the danger, jumped out of the car and fell on his head. M. Lemaître had but a slight collision with Gilles Hourgières' car, but though nothing prevented him from proceeding, seeing his "mecanicien" seriously injured and being very unnerved himself, he preferred to stop, and did not take further part. M. Flotte, the "mecanicien," was immediately taken to St. Cloud's Hospital. For two days he did not recover his senses, and the doctors thought he would die. Nevertheless, he is now much better, and we are glad to record that all danger of death is past. Another curious accident occurred at Versailles, where a man suddenly dropped dead owing to fright at the sight of Charron turning

a corner at such a terrific speed just in front of him. One of our illustrations, from a photograph specially taken for this Journal, shows M. René de Knyff going round a corner at full speed, the gendarme on the pavement pointing out the direction of the turn.

One most noticeable feature of the race was the unanimity with which the whole of the onlookers kept the route clear. If a dog crossed the path stones were hurled at it in perfect unison until the wretched beast was driven away. Vehicles were drawn on one side, whilst the spectators themselves, though closely packed, religiously refrained from breaking into the roadway when any cars were in sight. The police, too, were indefatigable in their efforts, and rendered considerable service by keeping corners clear and giving directions by signals to the contestants.

M. Giraud met with an accident near Vendome which, fortunately, had no serious consequences. He was going down a slight hill at full speed when one of his front pneumatic tires burst. The wheel itself soon gave way and the car went "head over heels" several times until it landed on the side of the road. The "mecanicien" was projected out of the vehicle, but M. Giraud was found under it. Most miraculously, neither of them suffered any serious injuries, and M. Giraud will probably be all right in a fortnight. The photograph taken by us and reproduced herewith shows the overturned car on the road side.

The only English competitors in the motor-tricycle section met with very bad luck. Mr. S. F. Edge's machine proved refractory from the start, and although Mr. Jarrott was more fortunate, yet he was ultimately incapacitated by his ignition apparatus getting soaked by the rain. At this time he occupied the third position in his section, but was passed here by several competitors. On getting his machine going again, by which time Mr. Edge had got level with him, further accidents occurred, and ultimately the fore wheels of both gentlemen's vehicles were buckled, necessitating their enforced retirement from the contest. Mr. Jarrott expresses himself determined to have another try next year. It must be remembered that he was totally unacquainted with the course, but now that he knows it he thinks he will have no difficulty in pulling off the event next year.

D. FARMAN.  
AGRICOLA.  
UBIQUE.

THE New York Automobile Cab Co. is reported to have framed its tariff at twenty-five cents per mile per person. The vehicles will ply chiefly in the shopping and mercantile centres of the city.

THE results of the Draguignan-Vidauban contest, which was over a distance of 85 kilometres, are as follows:—Motor-cars: 1, Gondoin, 2 h. 18 m. 42 s.; 2, Roubaud, 2 h. 58 m. 3 s.; 3, Stead, 3 h. 6 m.; 4, Gibert, 3 h. 28 m. 30 s. In this test De Fabrègues met with a rather grave accident, but fortunately was not injured very seriously. Chavehard gave up the contest in order to help him. Motor-cycles: 1, Mercadé, 1 h. 59 m. 8 s.; 2, Camoin, 2 h. 5 m. 18 s.; 3, Raoule, 2 h. 12 m. 28 s.; followed by Hippolyte and Mouton. It will be noticed that the first three motor-cycles beat the time of the first motor-car.

THE motor-car and cycle race between Aix-la-Chapelle and Coblenz, organized by the West German Automobile Club, was duly run off a few days ago. The distance was 145 kilometres (about 90 miles), and the conditions provided that no competitor would be eligible for a prize who occupied more than eight hours on the journey. Nine motor-tricycles and four cars put in an appearance at the starting point. Seven of the former and only one of the latter finished within the allotted time. The winner was Herr Cudell, of Messrs. Cudell & Co., Aix-la-Chapelle, the German licencees of the De Dion motors and motor-tricycles, his time for the ninety miles being 5 h. 22 m., or about an average of 16½ miles per hour.

## THE DUPRESSOIR MOTOR-TRICYCLE SPEED REDUCING GEAR.

IN our issue of March 24th last we published descriptions, with illustrations, of several devices which have recently been introduced with the view of providing motor-tricycles with a second, slow, speed for hill-climbing purposes. Since then still another device of the kind—the "Dupressoir," introduced by M. P. Dupressoir, of Paris—has come under our notice, and of it we are now able to give illustrations, together with a few brief particulars. Referring to Figs. 1 and 2, it will be noticed that the motor shaft is extended, and carries two pinions—one *M* continually in mesh with the spur wheel *I* on the axle of the tricycle, and one *J* in gear with a small intermediary pinion *L*; the latter gears with a spur wheel *K* keyed on one end of an upper short shaft *G*. At the other end of this shaft is keyed a clutch *H*, while between *K* and *H* is

FIG. 1.

loosely mounted a special pinion *F*. Both the pinions *M* and *J* are mounted loosely on the motor shaft *N*, they only driving their respective spur wheels when in contact with the clutch *A* keyed on, but free to be moved along the motor shaft *N* between them. The lever *C* is so arranged as to control the movements of both the clutch *A* and the pinion *F*, its movement being effected through the toothed segments *E D*, lever *T*, and handle *B*. The illustration Fig. 1 shows the position of the gear to give the slow speed; the lever *C* has been moved over, causing the clutch *A* to make rigid contact with, and so drive, the pinion *J*; while the clutch has thus been moved along the shaft to the right, the pinion *F*, which runs loosely on the shaft, has been gradually made to mesh with the spur wheel *I* on the axle, and it is only when the pinion *F* is fully in gear with *I* that it makes contact with the clutch *H*, so causing the power of the motor to be transmitted to the wheel *I* at a reduced speed. To allow the machine to travel at the normal speed of the motor, the clutch *A*, by means of the lever *C* and its connections, is released from the pinion *J*—the pinion *F* being simultaneously withdrawn out of gear from the wheel *I*—and brought into contact with the pinion *M*, so causing the latter to drive the wheel *I*. The speed-controlling handle is attached to the top

bar of the frame of the tricycle; a sector with four notches is also provided in connection with it, the respective positions being: (1) slow speed, (2) slow-speed gear half withdrawn, (3) both gears out, motor running free, and (4) high speed.

FIG. 2.

M. Dupressoir has taken advantage of the provision for the motor to run free from the transmission gear by providing a handle by means of which the motor may be put in operation before mounting the tricycle, so rendering the use of the pedals unnecessary.

## THE JULIEN FRICTION CLUTCH.

THE accompanying illustrations show sectional views of a new friction clutch devised by M. Julien and lately put on the market by M. G. Benoit, of 119 Rue St. Maur, Paris. Figs. 1 and 2 represent a clutch of this type adapted for use on motor-voiturettes. On the motor shaft is keyed the piece *B*, round which is fixed a hardened spring-steel band *G*, to which in turn is riveted a band of leather *H*.

FIGS. 1 AND 2.

Surrounding these, and running loosely on the shaft, is the pulley, or what may be termed the female portion of the clutch, to the boss of which is fastened the power-transmitting gear wheel. The spring *G*, when the clutch is thrown out, is under tension, and so has a tendency, by reason of its elasticity, to open out and make contact with the outer pulley *C*. To one of its ends is fixed a piece *J*, which engages in a corresponding recess in *B*, while at the other end is fixed a piece *I*, which continually bears against the special-shaped lever *L* pivoted on *B*. Perpendicular to its

axis this lever carries a roller *N*. Keyed on the shaft in such a way as to rotate with it, but still free to be slid along it under the action of a lever, is a sleeve to which is attached a wedge *P*. In the illustrations Figs. 1 and 2 the clutch is shown out of gear, the wedge *P* being forced in as far as possible. To put the clutch in gear the sleeve and wedge *P* are made to slowly move to the left; this allows the roller *N* and the lever *L* to slowly fall and the spring *G* to expand

FIG. 3.

until, when the wedge has been entirely withdrawn from beneath the roller *N*, the maximum contact between the two parts of the clutch is obtained. It will thus be seen that the contact is the result of withdrawing the tension on the spring band and allowing it to expand, the system, it is claimed, resulting in a very quiet working clutch. The

FIG. 4.

elasticity given to the spring and the degree of oscillation permitted to the lever *L* are such that the whole surface of the leather band *H* is brought into contact with the internal surface of *C*, this taking place until the leather band is worn down to the level of the heads of the rivets by means of which the band is attached to the spring *G*, provision being made for the quick renewal of the leather band when worn.

To prevent the spring band from getting out of its correct position, several small projections are attached to its inner face, these sliding freely in a small groove formed in the piece *B*. To prevent any oil reaching the leather band and so affecting its proper working, it will be noticed that the boss of the pulley *C* is provided with a special cavity, into which any free oil is caught and allowed to pass away by holes in the bottom of the cavity.

Fig. 3 shows a Julien friction clutch combined with a driving pulley for motor-carriages in which a special lubricating arrangement is provided. One of the arms *C* of the pulley is made hollow, and is provided with a piston *P*. This piston works under the action of centrifugal force, and in order to prevent the formation of a vacuum the under face of the piston is placed in communication with the atmosphere by means of a very small hole *O* formed in the lower end of the cylinder *C*. A screw plug is provided at the upper end of the cylinder to allow the latter to be filled with oil; the

FIG. 5.

plug is prevented from becoming unscrewed during the rotation of the pulley by means of a projection held rigidly in place by a spring *R*. The connection between the cylinder and the shaft is made by means of the pipe *T*, a constant supply of lubricant being thus delivered to the pulley bearing owing to the centrifugal action on the piston *P*. The clutch is made in quite a number of sizes, ranging from a capacity of  $\frac{1}{2}$  h.p. upwards, at a speed of 100 revolutions per minute. Fig. 4 shows the arrangement, utilising Julien friction clutches, adapted for a two-speed gear for motor-cycles or voituresses weighing under 5 cwt. The motor shaft is geared by spur wheels to an intermediate shaft on which two clutches of the type shown in Fig. 3 are mounted. Only one sleeve is provided, however, to two wedges, so that moving over the lever to one side gives the high speed, and to the other the low speed. Fig. 5 gives an illustration of a transmission gear for motor-vehicles, provision being made for three forward speeds and one reverse motion. It will be noticed that four clutches are used, controlled by two levers, the reverse motion being obtained by interpolating a small pinion between the pinion on the intermediary shaft, and the one on the differential shaft.

THE directors of the East Kent Motor-Omnibus Company, who intend commencing business about June 6th, have fixed their fares very low—so low that they will be sure to attract passengers. Sixpence all the way from Dover Market Square to the village of St. Margaret's is a fare that ought to draw, and if on the repeated trips the omnibus keeps full, as no doubt it will as the summer advances, the undertaking ought to be satisfactory to the shareholders.

## CORRESPONDENCE.

### THE CONTROL OF MOTOR RACING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My Committee has noticed that a communication emanating from the Automobile Club in reference to the control of motor racing has been widely commented upon by the press, and desires me to acquaint you with the following facts, in order that this important matter to the constantly-growing body of motorists who are taking part in racing on the track may be fully understood.

My Committee quite recognises that it is necessary that motor racing should be governed by a properly constituted central body, but at the same time objects to a club incorrectly styling itself "the only independent authority in this country" arrogating to itself the power of being able to constitute itself the recognised authority to regulate and control automobile races, competitions and time trials of motor-vehicles in Great Britain and Ireland. Quite apart from the incorrect supposition that it is the "only independent authority," there remains the important fact that the Automobile Club does not include amongst its members even 10 per cent. of the motor racing automobilists of this country, and it is therefore obviously unfair that such a club should seek to control the sport of those, who, for various reasons, are not members of this body.

The Motor-Car Club has already organized and controlled four highly successful motor-vehicle race meetings, and has at present under consideration the holding of similar race meetings in as widely distributed counties as Essex, Kent, Lancashire, Cheshire, Staffordshire, and Warwickshire.

Every motor race meeting held in this country up to the present time has been governed by the Motor-Car Club's Racing Rules and all the existing British records on the track have been made under this Club's government.

The Automobile Club has not promoted or supported one single track race up to the present time, and it is quite evident therefore that from a practical point of view, the Automobile Club has no *locus standi* in this matter.

Despite this, however, my Committee feel that the interests of the motor racers will best be served by means of an Union, composed of all Clubs and individuals, formed to control speed and time contests on the track. With this end in view my Committee will be pleased to appoint ten of its racing members to meet a like number of racing men appointed by the Automobile Club in order that rules may be framed for submission to a public meeting of racing motorists, a Central Control Board being appointed by this meeting to enforce the carrying out of the same.

It seems to my Committee that for one club to seek to control all and sundry motorists is likely to cause friction and disputes in the future amongst motor racing men who are not members of any club, and it is in order to prevent this that my Committee make this suggestion.

Yours truly,

Motor-Car Club, London, E.C., FRED. W. BAILY,  
May 31st, 1899. Hon. Sec.

# IRREGULAR POWER FROM DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was out on my new De Dion tricycle on Saturday, Sunday, and Monday last, and on each occasion the engine ran well at times and at other times it would not go at all, and when it did it gave no power more than firing the charge. I may say that on two of the above days I filled the carburettor right up to the top, with the result that for half an hour each day I could not get the strength out of the engine to go along on a flat road, though it fired every charge correctly. After running it on a block for half an hour it went all right for about twenty miles on each occasion; after that it went back to the same condition as when I started—viz., no power. I poured fresh petrol into the carburettor, but without any better result. As I am merely a novice at motoring, I should feel much obliged if any of your readers would give me some explanation on the above, and the reason why it should happen.

Swansea,

May 30th, 1899.

Yours truly,

JOHN WILLIAMS.

## THE ALLEGED BREAKDOWN OF ELECTRICAL CABS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been called to some reports in the daily papers with reference to the starting of the London Electrical Cab Co.'s vehicles on Wednesday last week, and I shall be glad if you will allow me to correct the statements therein made.

None of our cabs were in Farringdon Road or Farringdon Street on Wednesday. The procession of nearly seventy vehicles passed down Fleet Street and up Ludgate Hill, and then *via* St. Paul's, Newgate Street, and Oxford Street to Kensington.

In the reports it is stated that there were several passengers in the cabs, and that several accidents occurred. Both of these statements are absolutely without foundation, as there were no passengers in the cabs whatever, and the only accident which happened to the whole of the vehicles during the run was that some slight trouble was caused through one of the rubber tires coming out of the rim of the wheel.

It is also incorrect to state that some of the cabs had to return to the yard, as every one of the vehicles in the procession covered the whole route of about eighteen to twenty miles.

It is unfortunate that such unfounded reports reach the daily papers, and I am sure you will in fairness give publicity to this reply in your columns.

I am, Sir, yours obediently,

Juxon Street, S.E.,

May 26th, 1899.

WALTER C. BERSEY,

Managing Director.

## THE CRYSTAL PALACE CONTROL COMPETITIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have been so frequently asked "Why did you not get the gold medal at the Palace with your English motors?" that we think it is necessary to explain the reason for our not carrying off that desirable article. We entered in one section only, viz., for vehicles under 10 cwt. This race was to take place at 3 p.m., and, if five minutes had been allowed between each competitor starting, we should have started at 3.25. However, for some reason, at 3.15 we were told we were too late to take part, as the race was over. This was doubtless a mistake on our part, and we in no way attribute the error to the management, who gave us every consideration by allowing us to run over the course and be timed, the same as other competitors had done, but *without the right to participate in the chance for the medal*. After all, the

actual medal is of very little importance, so we decided to accept the offer. We have not received the time for our second car, but the times for our first car are as follows: We started at 4.47, and finished at 4.54 min. 58 sec. Our times for the six stops were not officially taken, or if they were we have not received a record of same. The winner of the gold medal took 8 min. 22 sec. to cover the course, and the winner of the silver medal 8 min. 34 sec., *exclusive of time taken for stops*. Our time was 7 min. 58 sec., *inclusive of time taken for stops*, and as two of these were very long ones we can safely suppose that one minute can be taken off the gross time to get at the net time. If this is so, our net time would not exceed about 7 min., or 1 min. 22 sec. quicker than the winner of the gold medal, and 1 min. 34 sec. quicker than the winner of the silver medal. It will therefore be seen that although we have not actually won the medals, we have the satisfaction of knowing that we covered the course in far and away the quickest time. We heartily congratulate Mr. Barnes on the splendid manner in which he got out of his motor "all it was worth." Had he had one of our English motors in his car he would most probably have done very much better time than he did. He is therefore justly entitled to the medal he holds. For ourselves, we can only say "better luck next time."

Yours, etc.,

Kilburn, N.W.

May 29th, 1899.

F. O. SEYD, Manager.

## THE WINNING MACHINE IN THE "COUPE DES MOTO-CYCLES."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We read in your issue of the 19th inst. that Beconnais won the "Coupe des Moto-cycles" on a Noé Boyer tricycle. It should have been stated that it was a Phébus\* tricycle, the make that has won nearly all the important races on the Continent this year. The mistake no doubt arose from the fact that Mr. Noé Boyer is the commercial director of the "Phébus" branch of our Company. We shall be glad if you will make the necessary correction in your next issue.

Yours faithfully,

For CLEMENT, GLADIATOR & HUMBER (France), LTD.,

Paris,

May 25th, 1899.

F. G. TEUTON,

Secretary.

\*[This tricycle was fitted with an Aster motor in the race mentioned. It is necessary that this should be mentioned, as the Phébus tricycles are fitted with both De Dion and Aster motors.—ED. M.-C. J.]

RECENTLY a party of ladies and gentlemen arrived in Wooler, N.B., with a motor-car, and as they were about to resume their journey about mid-day the driver was in the act of bringing the car round from the coach-house at the back of the Red Lion Hotel, where the party was located. The hill being steep the brake was applied, but as it failed to work, the driver, finding he had no control over the car, diverted its course and brought it to a stop by running it against the house of Mr. John Diamond, painter, situate in Ramsay's Lane. Just at the time a son of Mr. Diamond's (William, aged twenty years) and a lad named James Armstrong were walking up the footpath and were both struck by the motor before they had time to get out of the way. Armstrong was knocked over, but escaped with a few scratches and a shaking; but Diamond was firmly fixed between the wall and the car. On being extricated he was immediately carried into the house. Dr. Walker and Dr. Dey were soon in attendance, when it was found that in addition to a deep cut on the leg his thigh bone was also fractured, and it was feared that he had received some internal injuries.

A GROUP OF "SCOTTISH MOTOR-CAR MAKERS" AND THEIR FAMILIES.

## SCOTTISH NOTES.

### Motor-Car Demonstration.

THE event of the week in the Scottish automobile world was certainly the motor-car excursion of the staff of Stirling's Motor Carriages, Ltd., of Hamilton, on Saturday last. The day was one of brilliant sunshine, and at an early hour a large crowd had collected at the starting point to witness the assembling and departure of the numerous motor-carriages with their freights of holiday-makers. Altogether some fourteen motor-vehicles took part in the trip, every one of them being the Company's own manufacture, including the handsome steam omnibus which I have already described. The omnibus with twenty passengers was despatched first—after the cars had been photographed—as it was expected to travel more slowly than the smaller vehicles. This was afterwards found, to the surprise of everybody, to be scarcely necessary, as on several occasions the "bus" attained a speed equal to fourteen or fifteen miles to the hour—a really splendid performance for a vehicle carrying a score of people. Ten minutes after the departure of the "steamer" the procession of thirteen Stirling-Daimler cars got on the move, piloted by Mr. John Stirling, managing director of the Company, accompanied by Mrs. Stirling and Master Stirling, in an elegant and beautifully finished Stanhope phaeton, the body being painted in dark green, with wheels and under-carriage of vermillion, picked out with black, the mountings being nickel-plated. This car was followed by two nice looking family open wagonettes with Daimler motors, and belonging to two of the directors of the Company. Next in line was a covered wagonette carrying eight, and driven by Mr. J. D. Brimlow, the Company's secretary. This vehicle had a very handsome appearance, painted and upholstered in dark blue and fitted with a portable top of enamel leather, furnished with hinging plate-glass windows at the sides. Then followed a

wagonette with six, driven by Mr. P. M. Stirling, painted in dark brown, with upholstery of super cloth to match. The remaining cars were also of the wagonette type, with the exception of a light looking vehicle built as a char-a-bancs and convertible to a parcel lorry. All these were driven by

THE PILOT CAR, CONVEYING MR. AND MRS. STIRLING.

members of the Company's own staff. The city of Glasgow (11 miles) was reached in a little over the hour. The passage of the cars through the busy streets of the city attracted a great deal of attention, the steam 'bus being the subject of much favourable comment. The route followed was by way of Argyle Street, Buchanan Street, Union Street, Glasgow

Bridge and onward through Pollokshaws to the grounds of Crookston Castle where a substantial luncheon was served in the open air, and thereafter the day was given up to a lengthy programme of athletic sports and amusements. At 5.30 tea was served; thereafter the unfulfilled items on the programme were run off, and an hour later the prizes were distributed to the successful competitors by Mrs. Stirling. Cars were then lighted up, and by 7.15 all were again moving merrily homewards in the cool evening air. The fact that Saturday was "Children's Day" in Glasgow, when 6,000 school children were entertained in the parks, increased the usually large crowds in the city streets on Saturday evening, and when the line of cars reached the city it literally became a "triumphal procession," the dense crowds giving "the motors" a very enthusiastic reception. Hamilton was reached at 10 p.m. The "outing" was well organized, and everything passed off without the slightest mishap.

#### A New Motor-Car Company.

For some time past rumours have been prevalent with regard to the extension of the motor business in Edinburgh established and carried on so successfully by Mr. John Love under the title of the Edinburgh Autocar Company. This week the prospectus of the Edinburgh Autocar Co., Ltd., is published. The capital of the Company is £50,000, in £1 shares, the present issue being 15,000. Well-known Edinburgh names figure on the directorate, and it is stated that 5,000 shares have already been applied for. A very moderate valuation is asked by the vendor for the business, and with the exception of a cash payment of £750 he takes the whole purchase price in shares of the Company, viz., £2,336. From what I know of the motor business in Edinburgh, this Company, I am certain, has a prosperous future before it, and as it is to be managed by practical gentlemen with large holdings in it the public need have little hesitation in applying for shares. The registered offices of the Company are at London Road, Abbeyhill, Edinburgh, where prospectuses and application forms may be obtained, and the secretary is Mr. T. Roland Outhwaite, who is well known in Scottish automobile circles.

#### The "Dailies" and Motor-Cars.

It is interesting to observe the gradual change in the attitude of the daily press towards automobilism. Instead of having all sorts of unfavourable things to say about the motor-car, and inaccurate reports of incidents or accidents, the leading Scotch dailies appear now to be thoroughly converted, and many articles highly favourable to automobilism have recently been published. In the *Glasgow Daily Record* this week a series of articles are being published from the pen of Henry Sturme, under the title of "The New Era in Travel." The first article is headed "Facts and Fallacies," and the second, "How we have been Outstripped by the Foreigners." The first deals with erroneous notions of what a motor-car can do, and a statement of what mechanical vehicles can and do accomplish. The second article refers to the institution and development of the motor industry in France. These articles, appearing in a newspaper with a wide circulation, must be influential in educating a vast number of people, who never see a trade journal, in the subject of automobilism.

"BROWN HEATHER."

THE Haynes-Apperson Co., Kokomo, Ind., is reported to have received an order for a number of motor mail wagons, to be used by contractors in carrying mails between the inland towns of Porto Rico.

AN United States contemporary states that the Electric Vehicle Co., of New York, has given to the Willoughby-Owen Co., of Utica, a contract for the furnishing of bodies for automobiles in the sum of £12,000.

## SOME AMERICAN STEAM-DRIVEN MOTOR-VEHICLES.

By HORACE L. ARNOLD.

(Continued from page 192.)

Fig. 9 shows the Mason and Stanley frame construction in front. Fig. 10, taken from the Mason car with the cushion, foot-board, and rear body cover removed, shows the smoke bonnet, leading from the boiler to the rear, with its rectangular uptake, and gives a good general idea of the arrangement of the parts. Fig. 11 shows the rear axle and the tubular yoke surrounding the compensating gear, the construction of the end girders of the frame, and the adjust-

FIG. 9.—MASON STEAM CARRIAGE.—FRONT VIEW.

able pump-stroke mechanism, consisting of a pivoted, slotted lever, operated by an eccentric groove in the side of the gear box, which takes a roller on the free end of the slotted lever; the pump plunger rod is set in the slot to have such a length of stroke as will give a suitable constant boiler feed. Fig. 12 is a view of the Mason rear axle and compensating gear from the other side, showing the brake band and drum. Whitney, Mason, and Stanley all pull the brake band on

FIG. 10.—MASON STEAM CARRIAGE, SHOWING PARTS.

with the brake drum rotating, consequently a very slight pressure on the brake treadle causes a full brake action. Fig. 13 is a view of the Mason engines which have the cylinders cased in a nickel-plated jacket, polished to a mirror surface, so that in the picture it appears to be a glass case covering the piping, which it really reflects: this figure shows the

FIG. 11.—MASON STEAM CARRIAGE.—VIEW OF REAR AXLE FROM RIGHT, SHOWING VARIABLE STROKE PUMP ACTION.

FIG. 12.—MASON REAR AXLE FROM THE LEFT, SHOWING BRAKE DRUM AND SPROCKET ON COMPENSATING GEAR.

FIG. 13.—VIEW UNDER SEAT OF MASON STEAM CARRIAGE FROM THE RIGHT.

FIG. 15.—MASON'S QUADRANT AND CONTROL LEVERS.

FIG. 14.—MASON'S BURNER, PUMP, ETC., SEEN FROM UNDERNEATH CARRIAGE LOOKING UPWARD.

FIG. 16.—GAUGE-BOARD INSIDE DASHBOARD ON MASON STEAM CARRIAGE.

tumbling shaft, the Mason regulator, and the glass water-gauge, which was first placed inside under the seat, but which Mason has now changed to an outside location, in the same way as is shown in Figs. 4 and 5 of the Stanley car. Fig. 14 is a view of the Mason machinery from underneath looking upward, and shows the chain, the pump, the screw strut which connects the compensating gear yoke in the rear axle with the bottom of the engine frame, the piping, the bottom of the burner, and the open lower end of the down-delivery smoke stack.

The Mason engines have a free pendulum movement fore and aft on a hollow steam-supplying trunnion, and hence the right and left screw strut, pivoted to the engine frame and gear-box yoke, is enabled to at all times preserve the chain adjustment, although the engine rises and falls on the body springs. This screw strut requires universal jointing,

FIG. 17.—WHITNEY IN HIS NO. 2 STEAM CARRIAGE.

to accommodate the twist of the wagon frame due to uneven road surface.

Fig. 15 is an enlarged view of the right-hand end of the Mason seat, and shows the quadrant stand and levers, all nickelled and polished beyond the possibilities of good work with the camera. The short lever in front with a hand knob operates the cylinder cocks, the forward lever is for the links, and the rear one governs the throttle. The round knob to the left governs a boiler feed by-pass, which may be used to return an over-feed from the pumps to the water tank.

Fig. 16 shows Mason's elegant gauge-board located on the inside of the dash-board, and carrying an eight-day stem-winding clock and a cyclometer worked from the pump rod on top, and the steam gauge and gasoline tank air pressure gauge below. Various misleading reflections appear on the highly-polished dash-board surface, and the steering lever, leading from its joint near the wolf-skin foot-rug, leads off to the right of the picture.

The Mason car is without a doubt the finest in finish of any motor-vehicle yet made, and is at every point a thing of delight to the engineering eye. The weight of this wagon is perhaps something over 425 lb., as it has a 12-lb. fly-wheel and some extra levers, in addition to the Stanley equipment, besides the clock and cyclometer. The boiler weighs 95 lb., and the engines, weigh 38 lb.—just double the weight of the larger Stanley engines.

Fig. 17 shows the Whitney steam car No. 2. Whitney has built several wagons, no two alike. The first one weighed 750 lbs., and was driven by a pair of single engines, 2 in. bore, with 4 in. stroke. This car was completed in October, 1896, and had a light chain transmission. Whitney's second carriage, built for the Whitney Motor-Wagon Company, of Boston, from which these illustrations were taken, was finished February 20th, 1897. This car also has 2-in. by 4-in. cylinders; in his later wagons Whitney uses cylinders 2½ in. bore, with 4 in. stroke. All Whitney's engines are fitted with a valve-driving shifting crank-shaft,

driven by chain and sprockets from the engine crank-shaft, the valve-driving crank-shaft being fitted to change its angular position relative to its driving sprocket by means of a hand-actuated, longitudinally movable, double spiral grooved reversing sleeve. The action of this reversing gear is the same as that of the well-known shifting eccentric, the cranked valve-actuating shaft being introduced to avoid the large diameter sliding surfaces inseparable from the use of eccentrics, and for the sake of compactness.

Whitney uses two diameters of wheels, 36-in. rear drivers, and 36-in. front steering wheels, with 3-in. Hartford pneumatic tires, costing 120 dols. for the four, and used with 100-lb. air pressure. The wheels have steel rims and heavy reduced spokes, with bent ends at the hub. These particulars relate mainly to Whitney's wagon No. 3, a much heavier vehicle than No. 2, and hence are not all quite applicable to these illustrations.

It is enough to say that Whitney has tried bevel gears, spur gears, and chains for his transmission, and that none of them exactly meet his views. He has used rear-wheel sprockets up to 20 in. diameter, 2 in. pitch, and 1 in. face, and these very heavy and amply proportioned chains and sprockets do not appear much more durable than the lighter ones before used. The very large bronze and steel spur gear and pinion he used wore out with only 500 miles' travel. Whitney is at present directing his attention principally to this point of transmission mechanism. It is to be noted that all the motor-cars here illustrated have their transmission gear open to light road dust, and it is clear to the writer that the speedy destruction of all forms of gearing applied by Whitney has been due to grinding away, not to the legitimate wear of one clean, well-lubricated metal surface upon another.

As shown in Fig. 17, the general lines of Whitney's cars vary but little from common forms of carriages. The chief peculiarities of Whitney's construction are to be found in his frame construction, his valve motion, his front axle construction, and in his steering lever. Whitney is emphatically a hard driver, and he does not shun bad roads; he believes that the American motor-car must be equal to bad roads, and he works his car at high speeds over all kinds of road surface.

(To be continued.)

## PETROLEUM MOTOR-VEHICLES.\*

By JAMES D. ROOTS, M.I.M.E.

(Continued from p. 191.)

Figs. 23 and 24 illustrate the construction of the four-seated carriage. There are two friction clutches, one a slow speed of about 4½ miles an hour, the other a quick speed of about 11 miles an hour. With these clutches, however, any speed whatever between the maximum and one mile is easily obtained by the degree of slip allowed upon the clutch used. It might be expected, indeed it was frequently observed to the author, that there would be a great loss of power in allowing this slip—in fact, he rather expected it himself; but in practice it is not so, nor do the clutches become heated to any appreciable extent—for the degree of heating will be the measure of the loss of power—if the square inches of contact surface bear a correct proportion to the power to be conveyed.

When this car was first completed, the chains drove direct from the valve shaft to the axle, with a provision for taking up slack in the chain. But it was soon found that it was more convenient, as the car was arranged, to fit another countershaft farther forward and to drive the axle from this shaft. The balance gear was fitted to the axle, and the exhaust box parallel with the axle below the car as shown. This car in all probability did about 5,000 miles before the design was superseded. As with the previous cars, this one exceeded considerably the weight calculated from the drawing when designed. It weighed 12 cwt.

Fig. 25 is a plan of the motor. It is a twin-cylinder motor, from which was obtained at the first 3 brake horse-power, at a speed of 510 revolutions per minute. At the time of the *Engineer* competition the brake power was 3½ brake horse-power, running at the same speed. Except that the parts are mostly duplicated, the action is similar to that in the single-cylinder motor. Fig. 26 is a sectional elevation; A is the cylinder, B the piston, C the crank, E the cylinder cover, F the jacket, G the charge admission valve, G1 the air admission valve, H the exhaust valve, H1 the exhaust valve slide, H2 the eccentric, I the power and valve

\* A paper read before the Society of Engineers, May 1st, 1899.

shaft,  $I_1$  and  $I_2$  the chain wheels, two to one;  $J$  the oil-feed spindle,  $K$  the governor,  $K_1$  the governor link,  $K_2$  the governor sleeve,  $K_3$  the governor lever,  $K_4$  the governor slide,  $K_5$  the guide-piece for the slide;  $K_6$  is the governor block or collar on the exhaust valve spindle,  $Z$  the vaporiser,  $Z_1$  the starting burners,  $S$  the fly-wheel,

FIG. 23.

FIG. 24.

FIG. 25.

$S_1$  a copper cooling coil for the water from the jacket placed round the fly-wheel;  $S_2$  are blades fitted to the fly-wheel to induce a greater centrifugal action of the air through the coil.

This method of cooling the jacket water permitting only a small amount to be carried is decidedly the most effective that the author has

seen. Chains and chain wheels connect the crank shaft to a countershaft on which are keyed the friction clutches. These clutches drive either of the two chain wheels directly to the axle of the vehicle. The cranks of the motor are placed opposite each other. The method of governing by operating the exhaust valve and the oil feeder simultaneously, and by the same mechanism, enables a clean exhaust to be obtained, and the construction of the parts surrounding the vaporiser and igniter

FIG. 26.

relatively to one another ensures complete combustion. The method of governing was only arrived at after some years of experiment. The automatic burner for heating the ignition tubes enables the motor to run continuously, so long as it is supplied with oil, without any attention whatever, which, the author thinks, cannot be claimed for any other oil motor, whether for vehicle or for other purposes.

The water is pumped through the jacket; it then traverses the whole of the tubes of the copper coil, and after passing through the tube round the frame of the vehicle, returns to the water tank and the pump. There is a practically complete cut-off of the oil when the governor cuts out; a minute quantity of oil is fed to the vaporiser, but not to the engine, during the time the governor is cutting out, so as to provide for the larger feed required for the first explosion following the cut-out; there is, therefore, no graduation of oil for governing purposes. The idea of graduating the feed in the tube-ignited vehicle oil motors is born of inexperience.

The oil descends by gravity from the oil tank to the two grooves in the oil-feed spindle, which is moved to and fro by the lever. The eccentric on the valve shaft, actuated by the crank shaft, by chain wheels and the chain, moves the oil-feed spindle out, and it is returned by the spring surrounding the exhaust valve spindle. The larger groove is for feeding the oil for the explosion in the cylinder, and the smaller groove is for supplying the automatic burner with oil by means of the pipes leading to the vaporiser. The blast of air necessary for the automatic burner is taken from the air valve on the crank chamber. Air is displaced by the hollow side of the piston through the air valve and along the pipes, to meet the oil supplied by the smaller groove in the oil-feed spindle. When the speed of the motor increases the governor cuts out, and by means of the lever moves the blocks so that they keep open the exhaust valve; at the same time the oil-feed lever is only permitted to have a very slight movement to and fro. As soon as the blocks are released by being pulled back by the governor lever, the usual oil feed commences again, and the exhaust valves are closed by the springs surrounding their spindles.

When the piston is moving outwards, air is drawn through holes in the side of the vaporiser. The air coming through these holes sweeps off the oil from the larger groove in the spindle, and together the oil and air pass round the inside of the vaporiser and through the valve into the explosion chamber. They become thoroughly mixed and heated in passing round the vaporiser, and are in the form of gas or vapour. When the piston returns, it compresses this gas or vapour, and some of it is forced into the ignition tube, which fires it, and the piston is forced outwards again. In returning it displaces the burnt gases through the exhaust valve, which is opened at the right moment for their displacement. The cycle then recommences. When the motor has been running a little while, extra air is admitted by means of the additional valve  $G$  on the cylinder cover.

(To be continued.)

THE National Motor Co. has been incorporated at Buffalo, N.Y., to manufacture motor carriages, etc. The capital is £10,000.

A PARTY of seven gentlemen left Edinburgh on the 29th ult. in one of the Edinburgh Autocar Company's cars for a week's tour through the south of Scotland. One of the Company's touring cars ran a trial run on the 28th ult. to Dunbar and North Berwick, accomplishing the round of sixty-six miles in 4 h. 22 m.

## AN INGENIOUS CONTRIVANCE.

WE illustrate in the three engravings herewith an ingenious method of making a two-seated four-wheeled vehicle from any ordinary lady's bicycle and a motor-tricycle. The device is the invention of Mr. Rowland Winn, of Cookridge Street, Leeds, who has devoted

FIG. 1.

his mechanical skill to other details connected with automobilism, as we hope to demonstrate in future issues.

In the contrivance at present illustrated, it will be seen from Fig. 1 that the motor-tricycle is provided with a pair of coupling stays attached to the rear axle and free to swing in a forward or backward direction; these are removable at will from the machine, but in general practice are kept attached thereto. The ordinary lady's bicycle is deprived of its front fork and wheel, and in place of the ordinary fork a shortened fork designed to fit over the axle, and having a Y arm, is placed in the steering post of the bicycle as shown in all the illustrations. This improvised fork also carries a

FIG. 2.

swinging arm bolted to it which is attached to the handle-bar stem as shown. When this shortened fork is attached to the bicycle, the machine is brought up to the tricycle and is attached thereto by means of a long bolt passing through an eye in the short fork and eyes on each of the coupling

stays. The bolt is fastened by a nut as shown in Fig. 2, where Mr. Winn is giving the last turn with his wrench.

The transformed vehicle is shown in Fig. 3, and we are informed that the attachment provides a comfortable means of giving a friend a ride. Owing to the method of attachment the bicycle is not rigidly fixed to the tricycle, its weight being carried by the short forks resting on the axle of the latter,

FIG. 3.

and all other connections permitting a certain free swinging motion, so that the rear rider is not inconvenienced even when corners are turned at rapid rates.

It will be noticed that the tricycle bears a bell driven by friction with the tire on the front wheel, and the machine also bears several other "little fixings," the product of Mr. Winn's ingenuity. We may mention that the tricycle (one of the early vehicles of the Motor Manufacturing Co.) was originally fitted with tube ignition, but is now equipped with electrical ignition devices, the alteration also being effected by Mr. Winn himself, the owner of the vehicle.

THE employes of the Madelvic Motor-Carriage Company, Limited, Granton, near Edinburgh, held a smoking concert on Saturday, when Mr. Hugh Strachan, their late head engineer, was presented with a marble timepiece on his leaving the Company's service.

FRENCH regulations for the use of motor cars, besides ensuring good, safe mechanism approved by the Service of Mines, stipulate that each vehicle must carry the maker's and owner's address; each driver must be certified as capable by the Service of Mines; in crowded thoroughfares the speed must be reduced to walking pace, and must not exceed  $12\frac{1}{2}$  miles an hour passing houses, or  $18\frac{1}{2}$  miles an hour in the open country, except for races authorised by the local prefect or mayor, in which the speed may exceed  $18\frac{1}{2}$  miles in open country.

THE Graham Equipment Co. of Boston has secured an order for 135 auto-trucks from the National Transportation Company of Boston, to be used under the omnibuses of the various lines that the Transportation Company is establishing in the suburbs of that city. They are to be built with steel frames and will be equipped with Graham's spring suspension and equalized brakes. The National Transportation Company frankly admits that this system of spring suspension is the only one that will allow them to do away with rubber tires and yet permit the 'buses to run over the pavements of the city at a high rate of speed without jar and inconvenience to the passengers, or damage to the motive power. One of these vehicles will probably be entered at the contest of self-propelled vehicles at Liverpool next July and possibly some will be shown at the Agricultural Hall Exhibition.

**"DRIVING TO THE COMMON DANGER."**

At Bow Street, on the 29th ult., before Sir James Vaughan, Mr. Sidney Atkins, a director of the Automobile Association, of Prince's Road, Holland Park, W., and Fred Frantz, an engineer in the employment of the Association, were summoned for having driven a motor-car to the common danger on Constitution Hill on May 19th, the occasion of the Automobile Club starting on its Whitsun tour.

Mr. Chapromiere, who defended, said that Mr. Atkins was unable to attend the Court that day, but he asked that the case should be allowed to proceed.

Inspector Hamilton (A Division) said that his attention was drawn to the defendant's large motor-car at 11.45 on the morning in question by the commotion that it was causing amongst the horses on Constitution Hill. The car was then moving in a most erratic manner, going backwards and forwards across the road, making a great noise, and emitting smoke and steam. The horses attached to vehicles passing appeared very much frightened. One horse drawing a cab, in which two ladies were seated, became so restive that it had to be held while the ladies were assisted to alight, and then led past the car. Two saddle horses, which were being led along, plunged so that the man who was leading them had great difficulty in holding them at all, and another cab-horse shied and ran a distance of 150 yards, to the great danger of the public. Several people complained to witness, and he spoke to the defendants, telling them that they must stop the machinery at once, as the lives of passers-by were endangered by the frightened horses. Mr. Atkins said that the gear of the car was out of order, and promised to get another car to draw it away, and witness walked off. Some time after, however, the defendants recommenced their experiments on the car, and as horses again began to shy he reported them. In reply to the magistrate, the witness said that there had been a motor-car meet that morning and the defendants seemed very much distressed at not being able to accompany the other vehicles owing to their car breaking down.

Police-Sergeant 39 A gave similar evidence, adding that before the inspector arrived a troop of Horse Guards had passed. On nearing the car the horses plunged all over the road, and the men had great difficulty in inducing them to pass it.

The hearing was adjourned for the attendance of additional witnesses

**SPEED OF MOTOR-CARS IN ABERDEEN.**

IN the Aberdeen Sheriff Court on the 25th ult., a prosecution was brought against the driver of a motor-car, who was alleged to have driven at a greater speed than ten miles on the public roads at Craibstone. Accused denied the charge, and was defended by Mr. Emslie Smith, jun. Mr. William Murison, county clerk, gave evidence regarding the bye-laws in the county as to the rate of speed at which a motor-car might be driven. The rate of speed must not exceed ten miles an hour. James Smith, carter, Margaret Cottage, Bucksburn, stated that on the day in question he was driving a cart from Tyrebagger Quarry along the Inverurie Road when a motor-car came along. He could not identify the man who was driving it. The rate of speed was about twenty miles an hour. Witness jumped down and ran to his horse's head, as he knew the animal would be frightened, but the car was on him before he could do anything. The horse backed, and the accused and the animal tumbled into the ditch. The horse was hurt, and the shaft of the cart broken. Cross-examined, witness stated that the car was 150 yards away when he first saw it. It stopped opposite his horse. He had no experience of motor cars, but he saw them every day on the road. George Macrae, carter, Dyce, was in charge of a horse when the car passed. He got no warning. He had no experience of motor cars, but he had had experience of bicycles, and had run fifteen or sixteen miles an hour. He knew the motor was running quite fast. After evidence by Sergeant Bruce, Alexander Macrae, carter, said he was driving a bogie, and had no warning of the approach of the car. The speed was eighteen or twenty miles an hour. A witness who was in charge of a horse at Craibstone on the day in question said a motor-car passed him at a greater rate of speed than ten miles an hour. No warning was given of the approach of the car. Further evidence was given for the prosecution as to the rate at which the car was driven. Mr. Emslie Smith said the case failed, as no evidence of identification had been offered. The Fiscal said one witness had identified accused, and moreover accused himself admitted his identity to the constable. The Sheriff said he understood there was no question about identity. He thought Mr. Smith would be better of some other defence. Evidence was then led. A young gentleman who was in the car at the time explained the construction of the motor, and said that with the gear which was employed on the day in question the car could not have been driven at ten miles an hour. Witness said the car could go eighteen miles an hour, and the reason it was geared to that extent was that it was a French machine, and in France motor-cars could be driven at any speed the driver cared to use. Another witness gave evidence of a similar nature, and said they were too near the town to be going fast. He could not say why that should make any difference, but explained that in Aberdeen they never travelled at a greater rate than five miles an hour. It would not do to go faster. Witness was somewhat contradictory as to the different rates of gearing and possible speed of the car. The accused gave his account of the accident, and affirmed that the car was not run over ten miles an hour during the whole day. The Sheriff found the charge not proven.

**A PROSECUTION AT NUNEATON.**

GEO. ISON, motor-car driver, Nuneaton, was summoned by Joseph Hollingworth, coachman, Nuneaton, on the 25th ult., at the Nuneaton Petty Sessions, for failing to stop his car when signalled to do so by complainant, who was in charge of a restive horse. Defendant pleaded not guilty. Mr. W. Whiteman defended. Complainant stated that he met the motor-car in Abbey Street. His horse became fidgety. The motor was going at about six miles an hour. Witness signalled to the driver to stop, but he did not do so until the car had passed. One of the occupants of witness's trap, a lady, fell out. By Mr. Whiteman: Witness had driven the same horse past traction engines, and also past the motor-car. Arthur Collett, Dugdale Street, said he saw last witness hold his hand up and shout for the motor to stop. He saw Mrs. Bland fall out. He did not think the motor was stopped as soon as it might have been. Defendant stated he was on his way to the Midland Station. He met Hollingworth driving a two-wheeled dog-cart. When the horse was level with the motor-car it threw its head up. Hollingworth had both hands on the reins. When he was level with the car Hollingworth put one hand up, and he (Ison) at once applied all the brakes. The Bench expressed a difficulty to discriminate in these cases, and dismissed the case.

THE society founded to promote the fêtes in the town of Le Havre is now organizing, under the patronage of the municipality, a great automobile and cyclist fête for July 2nd next. Chauffeurs are invited to take part in it dressed in fancy costumes and with their machines decorated either with flowers or otherwise.

We learn that in regard to the International Automobile Exhibition to be held in Berlin during September next at the Royal Gymnasium of Carlstrasse, the Committee has just been constituted as follows: Honorary president, Herr von Podbielski, Director-General of the Imperial Posts; members: Councillor A. Klose, General G. Bocker, Herr Felix Simon, Dr. Müllendorf, Comte Talleyrand-Périgord, Herr Fritz Hille, Herr E. Borsig, Colonel Budde (chief of the State Railways Department), Major-General Baron Van Bruddenbroch (Marshal of the Court), Councillors L. M. Coldberger and J. Löwe, Prince Frantz von Ratimer, Major Schœnbech, Major Comté Schonborn-Wiesentheid (Aide-de-Camp of the Imperial Chancellor), and Herr von Balz (President of the Wurtemberg State Railways).

**TO CORRESPONDENTS.**

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

LONDON, FRIDAY, JUNE 9th, 1899.

[No. 14.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### The Speeds in the Paris-Bordeaux Race.

It is interesting to compare the average speeds of the cars and cycles participating in this race over various distances. Unfortunately it is impossible, of course, to determine what was the highest speed attained by any

competitor during the continuance of the race, but the averages over differing distances give figures of very considerable interest. The average speed of Charron, the winner in the carriage class, over the whole course was 48 kilometres 199 metres per hour, whilst that of Bardin, the winner in the cycle division, was 42 kil. 269 met. for the whole 565 kil. (351 miles). Comparing the times of arrival of the first motor-car and the first motor-cycle at the various timing places, we find in every instance and over every class of road that the carriage was running the faster of the two types. From Suresnes to Châteaufort, a distance of 21 kil. 450 met., the time occupied by the first car was exactly the same as that occupied by the first motor-cycle, viz., 28 minutes, which gives an average speed over the distance of 48 kil. per hour, or about equal to Charron's average speed over the whole journey; in all other cases, however, the average speed of each class varies considerably, and does not even vary synchronously.

| Stations.                            | Distance. | Type.     | Time.     | Average   |             |

|                                      |           | " Cycle   | 1 27      | 48 965    | 30 753      |
|                                      |           | " Car     | — 47      | 42 127    | 26 312      |
|                                      |           | " Cycle   | — 52      | 38 076    | 23 1,167    |
|                                      |           | " Car     | 1 25      | 46 588    | 28 1,679    |
|                                      |           | " Cycle   | 1 33      | 42 580    | 26 810      |
|                                      |           | " Car     | — 59      | 42 711    | 26 955      |
|                                      |           | " Cycle   | 1 6       | 38 181    | 23 1,282    |
|                                      |           | " Car     | 2 54      | 43 793    | 27 375      |
|                                      |           | " Cycle   | 3 41      | 34 479    | 21 751      |

These comparisons, of course, do not necessarily give the fastest time or highest average between the stations. The times are those of the first of each class of vehicle to pass the stations, and it may be that others did the journey between some of these points in quicker time, although not being first. From this table it is seen that the highest speed recorded is 61 kil. 579 met. (38 miles 465 yards) per hour, whilst the slowest is 34 kil. 479 met. (21 miles 751 yards) per hour.

### A New Tricycle by the Beeston Co.

We recently had the pleasure of meeting Mr. Crampton, who was driving his new 70-millimetre motor-tricycle specially made by the Beeston Company to his order. The motor is fitted with both tube and electric ignition devices, and although, of course, Mr. Crampton prefers the electric ignition yet he finds the incandescent tube very useful in case of temporary inefficiency of the former. The tricycle is also fitted with a special arrangement for lifting the exhaust valve, so that pedalling can be carried on without working against the resistance of the motor in the compression stroke. Mr. Crampton finds this arrangement much more satisfactory than the old device of opening the compression release-cock, and moreover there is no noise under the new arrangement. The makers, too, have fitted pinions and spur wheels of a much greater width than usual, and the machine, as a whole, is so satisfactory that there has not been the slightest hitch during running. On the first trip one or two nuts worked loose, but the tightening up of these is practically the only adjustment that the user has found necessary. We are informed by Mr. Crampton that the machine easily covers twenty miles per hour, whilst with a trailing-car its speed is not reduced below sixteen miles per hour. Like most other users of motor-tricycles, Mr. Crampton finds advantages in electric ignition other than those connected with the ability to advance the ignition of the charge. The absence of the heat arising from the tube and the lamp is, of course, a great consideration with the 1½-h.p. motor, especially during such weather as that recently experienced, as the motor is much less readily incapacitated and considerably longer runs are possible.

### More "Movements" in the Motor-Car World.

AMONGST the latest changes in the staffs of manufacturers of motor-vehicles is the speedy termination of Mr. Van Toll's engagement with the Daimler Motor Company. Mr. Van Toll has probably had more experience in motor work than any other man at present in England, having been engaged in some of the leading factories on the Continent before coming to England. We understand that Mr. Van Toll's present intention is to start in business on his own account, rather than to engage himself to another firm of manufacturers. We wish Mr. Van Toll every success whichever path he may ultimately choose; but we are of opinion that several of the English manufacturers would be very glad to secure his valuable services.

### "A Time of Pressure."

THE present and next eight or ten weeks will be a period of unprecedented activity in the motor-car world, both in France and in England. In Paris the trials of vehicles suitable for cabs is proceeding even at the time of writing. To-day the Automobile Club's trials of vehicles, both for hill-climbing and efficiency tests, are commencing, and continue day by day until Tuesday next (Sunday, of course, excepted), and on Thursday the Club's speed contests

are to be run off. On Friday in next week another function commences, whilst on July 3rd the Motor-Car Exhibition opens at the Agricultural Hall, and the series of efficiency contests, promoted by this Journal, commences on the 4th prox. In Paris, notwithstanding the unfortunate closing of the Automobile Club of France, the exhibition promoted by the Club, and to be held in the Tuileries Gardens, open its doors on June 15th and closes them on July 9th. This is to be followed immediately by the race promoted by *Le Matin*, our Parisian contemporary, over a course of 2,500 kilometres, or nearly 1,609 miles. This is again to be followed by the trials of heavy vehicles at Liverpool organized by the Liverpool branch of the Self-Propelled Traffic Association. What with three exhibitions and four separate and distinct groups of motor-vehicle trials, the enthusiastic automobilist will have a busy time. Certainly the French Exhibition promises to be far and away in advance of any other show yet promoted, but running that a good second will be the Motor-Car Exhibition at the Agricultural Hall. In the meantime the cry of all makers is "Give us time." Every one of them is engaged in producing new types of vehicles, and hardly one can find time to pay attention to these new productions owing to the extreme pressure of orders for vehicles of the older types for immediate delivery. In almost every factory shifts of men are employed working day and night, and yet with all this the order book cannot be cleared. We know one firm who have orders in hand for no less than twenty-seven cars more or less of the same type, all of which are supposed to be ready for delivery within the next few weeks, but we are greatly afraid that purchasers will have to wait. Manufacturers, of course, do not like to lose the chance of taking part in the exhibitions, but they necessarily cannot make the show they would like to do when under penalties to deliver cars already on order. As a consequence, we are afraid that several manufacturers will have less complete shows at the exhibitions than they would like, but at the present time necessity, in the shape of business pressure, compels it. Motor-cars are not like bicycles: their component parts can neither be produced so readily, so quickly or so automatically, nor can they be "erected" or placed together in anything like the same space of time. The cycle, as compared with the motor-car, embraces but a very few trades—the saddle maker, the lamp manufacturer and the tire manufacturer being almost the sole outside trades employed; but the motor-car trade, at any rate in the carriage branch, embraces a greater number of trades than might be imagined at first glance. Tools, too, are difficult to obtain, whilst stocks of materials are almost impossible of acquisition; labour, also, is scarce, and that available is practically untrained in the particular work to be performed. We are afraid, therefore, that some disappointment must be experienced by the public.

#### The Automobile Club's Motor-Vehicle Competitions.

THE complex series of trials for motor-vehicles promoted by the Automobile Club commences during the present week. The programme originally laid down embraced almost every known type of vehicles, but we learn that some of these classes will perforce be abandoned owing to lack of entries. Speaking broadly, the competitions are divided into two classes, one for vehicles under 1½ tons tare unladen, and one for vehicles over that weight. These classes are subdivided into sections embracing vehicles propelled by steam, electricity and petroleum-spirit. The tests comprise hill-climbing competitions and road runs over varying distances for different types of vehicles, whilst a special speed trial over a very limited course is also projected for those manufacturers who like to enter their vehicles. This latter will be held, of course, over private roads, the law not permitting high speeds on public roads. The hill selected for the hill-climbing competition is Petersham Hill, the start taking place from the Star and Garter Hotel at 11 a.m. to-day. To-morrow the efficiency trials for electric vehicles will be commenced, the run being thirty miles. The start takes

place at 11 a.m. from Richmond, at a spot adjoining the London and South-Western Railway goods yard, and the route is by way of Kingston, Esher, Leatherhead, Epsom, Ewell, Combe, and back to Richmond. On Monday next, at 11 a.m., the steam and petroleum-spirit motor-vehicles will be started on their efficiency test over fifty miles. The course selected is on the Oxford road, the start taking place from the Red Lion Hotel, Southall, at 11 a.m., and the cars proceeding for twenty-five miles towards Oxford and returning by the same route. On Tuesday, the 13th inst., those vehicles over 1½ tons tare unladen will carry out their trials. These will start from the Chequers Inn, High Street, Uxbridge, at 11 a.m., and proceed ten miles towards Oxford and return to Uxbridge over the same course, the run therefore totalling twenty miles. The programme is an interesting one, and as the vehicles are only required to carry out the test once there should be no difficulty in their doing so.

#### "Hippopotami" on Wheels.

AT the meeting of the Ongar Guardians on Tuesday in last week, some of the members indulged in giving vent to a series of such utterly ludicrous statements that we think they are worthy of reproduction in our columns. One member named Thos. Atkins inquired if steps could not be taken to regulate the speed of motor-cars along the country roads. They were, he said, a source of great danger to persons driving. The cars were driven at a great rate, and when they were at a standstill they made such a horrible noise and emitted such an offensive smell that horses would not pass them. Their shape and colour, too, were enough to frighten the most quiet horses. One recently in the Toot Hill district was like a hippopotamus, and painted a flaming red. Having ended his diatribe, Tommy Atkins gave place to the chairman of this august and haughty body, and this gentleman, Mr. Lawrence Marriage, continued the discussion by gravely stating that on the previous Sunday a motor-car raced him at the rate of twenty miles an hour. We would remark that Mr. Lawrence Marriage is deserving of very severe censure in permitting his horse-drawn vehicle to run with a motor-car at twenty miles an hour. Think of the cruelty to the horse, forcing the poor creature to travel at the rate of a mile in three minutes! What a wonderfully speedy horse Mr. Marriage must possess, too! He concluded by stating that his horse ultimately bolted, and that he only avoided an accident by turning into a side road! Mr. Marriage is to be congratulated on his ability as a driver of horses. He races at twenty miles per hour, and then, when his horse "bolts," is able "to avoid an accident" by turning it into a side road, which, of course, most providentially came into its position specially for the purpose. To an unprejudiced onlooker it would rather appear that Mr. Marriage was so disturbed by the fact that his horse could race no longer that he turned into a byeway in order to make defeat less obvious. It is foolish to indulge in racing horses against motor-cars, besides being cruel; let us hope Mr. Marriage will know better next time. At the conclusion of the discussion Mr. Tommy Atkins proposed that the chairman and a Mr. Raby should call the attention of the Highways Committee of the Essex County Council to the "dangerous way in which motor-cars are driven through the country," and the chairman promised that they "would see to it." For the guidance of Mr. Marriage on the occasion of his next meeting a motor-car when driving his fast trotter, we would remind him that he can stave off his defeat and consequent gall by galling the motor-car driver. All that is necessary is that he should hold up his hand, and the motor-car is bound to stop by the provisions of the law. Mr. Marriage can then, if he likes, deride the motor-car driver and proceed on his journey at a little less wonderful speed for a horse-drawn vehicle than twenty miles per hour. In the meantime, Mr. Tommy Atkins may be reminded that there is at present no law to prevent an

automobile or a hippomobile from being painted "a flaming red" or, indeed, any other colour the owner may choose to select.

**A Commentary  
on the Ongar  
Guardians.**

THE following amusing commentary on the Ongar Guardians' action in this matter is extracted from the columns of our contemporary, the *Essex County Chronicle*:—"Mr. Thomas Atkins, a

"member of the Ongar Rural Council,

"feels much righteous indignation at the way in which motor-cars are beginning to monopolise our country roads. There has been, it seems, a 'hideous monster' in the Toot Hill district, in the shape, according to Mr. Atkins, of a 'hippopotamus,' and painted a flaming red. Mr. Atkins encountered this curiosity as he was quietly riding home from Epping behind a sedate and docile mare. The 'monster' was at rest, but Mr. Atkins is not quite sure that its quiescent state is the least alarming, for although when on the move it bowls along the country roads with the 'speed of a cyclone, when it is standing still it 'makes such a hideous noise and emits such a horrible smell' that the 'most self-respecting equines become alarmed thereat. Evidently the Light Locomotives Act will have to be considerably amended and added to. Mr. Atkins has a 'picturesque flow of language, and when he warms to a 'subject he can, metaphorically speaking, paint things as 'red as the demon motor which has so raised his ire."

**NOTES FROM THE MIDLANDS.**

ALTHOUGH apparently unknown by a great many people, there is much work being done in the Midlands towards the production of motors, also motor-cycles and large cars, and this is particularly the case in Coventry, where the many large cycle companies are turning their attention to this new method of locomotion, which, in a very short space of time, is bound to practically revolutionise traffic, both pleasure and business. So much progress has already been made, and motors are running every day so regularly and precisely, that it can no longer be said that the motor-car is a useless and obnoxious machine, but is rather already of a distinct service to mankind. The public are fast grasping the fact that this is the case, and are taking a very keen interest in the development of the "new baby" which they must soon be called upon to keep. Doctors already are using motor-cars and cycles, and find that they not only do away with the expense consequent upon using horseflesh, but they also find that they can cover their rounds in much less time, and consequently have a greater amount of leisure.

Of course, as in ordinary traffic, a great variety of purposes have to be served by motor-cars, and the tendency at present amongst the many firms in Coventry who are going into the matter is to produce what is undoubtedly wanted, viz., a small light car capable of carrying two people, or one equally comfortably, and capable of a moderate speed uphill and down. There are many reasons why this is the case, first of which is, of course, cost of manufacture, and secondly, tools for production. Many cycle firms have already tools in use which can cope with most of the work required on small motors, hence their wisdom in commencing on this class first. Again, there is a strong demand for these light vehicles on account of their comparative cheapness and also extreme handiness. Of course, in the case of the Daimler Co. and the Motor Manufacturing Co., whose works were specially equipped for a larger class of motor, any description of work can be carried out; and these firms are experimenting with vehicles of a lighter class, although they continue the production of the larger.

Amongst the cycle firms who are taking up the matter may be mentioned the Humber Co., the Raglan Co., Messrs. Bayliss & Thomas, the Progress Co., the Beeston Co., and many others; and it is my purpose to explain in detail, from time to time, the various productions of these firms. The Humber Co. are making a very good "quad"—that is, a machine with four wheels, having a comfortable seat in front, and a cycle saddle and pedals for the driver behind. The Company tell me that they have several machines nearly finished, but awaiting tires, which it appears there is much difficulty in getting from the Dunlop Co., who, ever to the front with pneumatic tires, are now making a speciality of motor-car and cycle tires. This firm are inundated with orders for tires for this purpose I am told, and, I believe, took an order for 500 from one firm alone this week. The Humber Co. have also been experimenting with a larger car, somewhat similar in appearance to the Hurler car, but of course entirely different in mechanical details. From what I have seen of this car it is speedy and powerful, though somewhat heavy for two passengers. Some very good runs have been made on this car, though considerable improvement is necessary.

The Progress Co. are making an exceedingly elegant car for two, which I have examined in its unfinished state. There are many new departures from ordinary accepted motor design in this little car which I hope to fully describe later on, when I have had some trials on it. They have also made a Benz type car and several tricycles, all of which have been fairly successful. The Raglan Cycle Co. have made one car of the Benz type, though much heavier in detail. This car I have tried and thoroughly tested, and there is no doubt that it is a strong and very fast car. The countershaft pulleys run on ball bearings, which of course lessens noise and friction besides increasing their life. This firm also open one of the induction valves by means of a cam and lever, so that this gas valve can be accurately adjusted as to life, and always gives the same passage for gas whether the engine is working fast or slow, which of course is an improvement. The firm are building twelve of these cars for a start, and, judging by their first production, should do well, as the car is certainly strong, well built, and very powerful. The Endurance Motor Co. are also making a car somewhat on Benz lines, and their first car, though slightly under-powered, does credit to the firm.

The Motor Manufacturing Co. is doing a large business in large cars as well as small, chiefly charr-a-bancs and wagonettes, which are being sold for hiring purposes. One firm in the North of England, at Sunderland, has already ordered twelve of these cars, nearly all of which have been delivered. The Daimler Co. are supplying large 8-h.p. vans to the Post Office, which I think will be the heaviest vans drawn by petroleum-spirit at present running in England. Of course, as I stated before, most of the smaller types of cars are being built entirely as experiments; but there is no doubt that a great many of the firms are on the right track, and will shortly be producing satisfactory vehicles in quantities.

Coventry, I think, may safely be styled the centre of the industry so far as manufacturing is concerned. Birmingham is not at present quite so go-ahead. I have heard a rumour that Mr. Dunkley is about to take the premises lately occupied by the Anglo-French Motor Co., but this requires verifying. There are several cars running in and near Birmingham, chiefly Benz, though there is a very fine Panhard, and also a Mors. It is strange in a city like Birmingham, devoted so entirely to the metal and engineering trades, that there should be such lack of interest in what is undoubtedly the trade of the future. The Dunlop Co., at Bournbrook, are making tricycles and small cars, as also are Messrs. Accles.

"VERAX."

## THE ESTABLISHING OF RURAL AND OTHER MOTOR-VEHICLE SERVICES.—I.

AT the present time there is undoubtedly a widespread movement, extending practically through the whole kingdom, in regard to the establishing of services of mechanically-propelled vehicles for the conveyance of passengers and parcels. A few words in respect to the conditions governing the inauguration of such services will not, therefore, be out of place at the present time. The conditions governing the establishing of services of vehicles running at intervals over definite routes cannot be too closely investigated both by those already desirous of establishing services and by those to whom the advantages to be secured by such services are not yet sufficiently well appreciated to have caused them to give any considerable consideration to such a scheme.

The advances made during the past few months in forming local services have been chronicled from time to time in the columns of this Journal, but perhaps it is hardly appreciated that within the past three months close upon thirty separate and distinct services have been projected, and in by far the largest majority of cases some vehicles are already in operation on each of the routes selected.

It may be asked, What districts and conditions are most suited for public motor-vehicles services? Speaking broadly, it may be said that such services are suited to every district in which there are signs that the traffic would warrant them. The condition of a district in respect to the character of its roads, its general contour, and the accessibility of various places comprised in its extent have, of course, some influence on its suitability as a profitable field for the running of public vehicles, but these are not "governing" influences so far as its suitability is concerned. Motor-vehicle services will pay quite easily in districts or between towns or villages badly served by railways; they will prove remunerative when towns, although contiguous, are served by railways making long detours, or when connected only by lines having junction at a considerable distance. In such cases as the latter the railway fares are necessarily high owing to the distance to be traversed: but it frequently happens that the distance by road is very considerably less, and as the motor-vehicle is able therefore to negotiate the journey in considerably less time than that taken by the railway train, it follows that it will receive most of the patronage even though the fares charged are equal to those of the railway company. Of course in such cases, if the amount of traffic warranted it, it would be wiser to materially lower the charge for fares, as by this means those who patronised the road service would be pleasantly reminded that they conserved both time and money.

Motor-vehicle services pay also even in those districts that are comparatively well and cheaply served by horse-drawn vehicles. This has been proved to demonstration not only in such places as may be termed "pleasure resorts," but also in busy centres—Sunderland, for instance, where the "omnipotent motor" runs in competition with hippomobiles and at the same fares. The reason for the success of the motor-vehicle is not difficult to find. Its ability to thread its way through congested streets is far beyond that of horse-drawn vehicles running on the roads, whilst those running on rails are left far in the rear. In these days of quick movement time is everything to the busy man, and he will preferably patronise that vehicle which reaches its destination in the shortest time even though its actual running speed may not be greater than that of the hippomobile.

The reasons of the profitable nature of the automobile as a public vehicle as compared with its horse-drawn competitors are many. Let all consideration of the saving in expense owing to it being unnecessary to provide stables, food whilst resting, bedding, shoes, harness, etc., be placed on one side, and it will still be found that the automobile is a greater

money earner than the hippomobile by reason of its ability to travel a distance with a given load in one day far beyond the capacity of a pair-horsed vehicle in two days. This is not due to its quicker travelling only, or indeed, principally, but almost solely to its greater endurance. It will carry out a duty day after day for long periods that the hippomobile is unable to accomplish even for two days in succession; indeed, it will in one day carry out a duty without incapacitation that would entirely "knock out" the finest pair of horses ever foaled.

As to the suitability of districts for profitable motor-vehicle services, it must be conceded without argument that those residing in or having business connection with a district are most favourably situated in regard to forming opinions on this point. It is for this reason that we advocate local enterprise in forming and maintaining motor-vehicle services. An enterprise formed locally and belonging almost solely to those interested in the locality is much more likely to succeed than is a similar enterprise established by the aid of outside capital and influence, as the first will attract support by sympathy as well as by convenience. The needs of a locality are best known to local residents, and most probably will be better catered for by local enterprise than by outside adventurers. Wherever possible, therefore, a public motor service should be established by local influence rather than from the outside.

The class or type of vehicle to be employed in conducting these services is of course one of the first questions to be considered. Speaking generally, we think it will be found that in the majority of cases vehicles of a moderate size, carrying a medium number of passengers, will be found to be more profitable than larger and more costly vehicles carrying a greater number of persons. It follows that if a vehicle is properly "powered" it will be more profitable to run it with a full than with a partial load. It generally occurs that full moderate loads at frequent intervals can more easily be secured than larger loads at less frequent periods. Besides this, directly a vehicle becomes unwieldy and unduly heavy, partly owing to its greater capacity, half of the advantages of mechanical locomotion are lost, by reason of its inability to thread its way with such ease as the smaller and lighter vehicle through congested traffic; its greater weight and length, too, make the vehicle less "handy" either in traffic or in turning. It is generally found, also, that the wear and tear of the larger vehicle is proportionately greater than that of the smaller. Again, if one of the smaller vehicles of a frequent service is incapacitated by reason of accident or breakdown, the inconvenience to the public will be less than would be the case if a large vehicle of an infrequent service were unable to carry out its duty.

It is always advisable to have a spare vehicle ready to put on the road in case of breakdown or pressure of traffic, and the capital thus partly idle is of course much less in the case of a vehicle of moderate dimensions than with the larger and more capacious carriage. Except in very exceptional cases, therefore, a vehicle of moderate size and carrying a moderate load is likely to prove more remunerative, as well as more convenient, than a larger conveyance that at the first glance would appear to be more profitable by reason of its greater capacity.

(To be continued.)

FROM all sides complaints are now heard in Paris in regard to the furious speeds of certain motor-car drivers. At Neuilly, in particular, it is on the tapis to prohibit the circulation of motor-cars on the lower side of the Avenue. The shop-keepers complain of the danger that arises from motor-cycles which are driven at full speeds round the corners of the streets adjoining the Avenue. The regulations allow a speed of 20 kilometres a hour through traffic, and the chauffeurs can go at their full speed in the open country if they like, but they must decrease their speed when there is the least obstacle.

## The New Light Daimler Car.

THE DAIMLER MOTOR CO.'S NEW TWO-SEATED LIGHT CAR.

WE illustrate herewith the latest production of the Daimler Motor Co., Ltd., of Coventry and London. The car will fill a long felt want, being light and very speedy, moderately priced, roomy and comfortable, and extremely easy of manipulation. Indeed, its last recommendation makes it an ideal car for a lady's use, as the change of speeds, the guiding of the car, and putting the motor into gear with the road wheels can be effected with ease by the little finger alone.

The engine is of the usual Daimler type, and therefore needs but little description. It is of the double cylinder vertical type, has tube ignition, and develops 4 h.p. effective. It is so placed, contrary to the Daimler Co.'s previous practice, that its crank shaft lies athwart the frame, and not in line with its length as usual. The crank and valve-control gear is contained in an aluminium casing, preventing the outflow of any oil. The crank shaft is extended right across the frame, bearing on each of its ends belt pulleys. The engine itself is suspended in an ingenious manner, and can be adjusted in position by manipulating two tie-rods fitted with bolts projecting in a forward direction through the frame body.

The power is transmitted from the pulleys on the crank shaft by means of belts to an intermediate shaft, and from thence by a chain and sprocket to the rear axle. In this case the rear axle is a live one, the road wheels, of course, being fixed thereto. One, and a leading, feature of this car

is the extreme care taken in providing this axle with sufficient bearing surface to prevent any possibility of it giving way at the differential coupling. At each side of the frame, it is carried in a long sleeve, and has additional bearings at the centre, the whole being firmly tied by upper and lower suspension axle braces.

Primarily two speeds are provided by the two belts, fourteen miles and twenty-eight miles per hour nominal. These speeds, however, are increased to four by an ingenious application of an old form of "tooth-seeking" gear. This permits the low speed to be cut down to one half, and the high speed to be cut down to such proportion as may be laid down. The belt shifting device is controlled by a small hinged lever placed on the left of the driver immediately under his hand and quite close to the front of the seat. It moves over 180 degrees of a circle, but each speed requires its movement only over ninety degrees. When the lever is partially turned in this quarter circle, some amount of "slip" takes place and consequently the speed developed is not quite up to its normal rate; when the lever is placed at less than forty-five degrees, however, it is made to automatically return to dead centre, so that both belts are placed on the loose pulleys. The speed-dividing gear is also worked by a small hinged lever working in slots in the remaining 180 degrees of the circle occupied jointly with the belt shifting device.

Steering is easily effected by a small hand-wheel placed on the right of the driver, immediately under his hand.

Consequently no straining of the body or reaching forward is necessary in effecting any of the manipulations necessary for controlling the car, and from this point alone it offers great convenience, especially to lady drivers, who can carry out every operation without removing from the comfortable back rests fitted to the carriage.

As will be seen from the engraving, the wheels are of the tangent-spoked suspension type, and are fitted with pneumatic tires.

We congratulate the Company and Mr. Critchley, its work's manager, on a thoroughly good production, having many features of great improvement. We understand the price of the car is about 200 guineas, and our readers will have opportunities of seeing and trying the vehicle next month at the Motor-Car Exhibition at the Agricultural Hall.

## THE "JUPITER" CARBURETTOR.

THE accompanying illustration shows a section of an improved carburettor for petroleum-spirit motors which has lately been introduced by M. W. H. Dovey, of 14 Rue Torricelli, Paris. The petroleum-spirit passes from the main storage tank by the pipe *A* into an intermediary chamber provided with a float *C*. As the level of the spirit in the intermediary chamber rises the spirit passes out by the passage *E* and rises up the vertical tube *F*. The parts are so arranged that when the level of the spirit has reached a point close to the top of the pipe *F* the float *C* rises and the inlet pipe *A* is closed by means of the needle *D*. As the level of the spirit in the apparatus falls the float *C* and the needle *D* fall, so again opening and allowing spirit to pass along the pipe *A*. Air is drawn in through the opening *G* and projected against the piece *F*. The latter is of a special form, its exterior surface being conical, and provided with three helicoidal grooves; the effect is to cause the indrawn

air in rising to travel round the piece *F*, a preliminary mixture of the air and spirit taking place at the top of the piece *F*. Arranged in an upper chamber are two small fans, *H H'*, which under the effect of the aspiration stroke of the motor revolve automatically, further intermingling the air and spirit ere the carburetted air passes out through the opening *I* to the explosion chamber of the motor. The opening *G* can be regulated to allow any desired quantity of air to pass into the carburettor, while a regulating device is provided on the outlet pipe *I* by means of which the quantity of carburetted air allowed to pass to the explosion chamber can be varied as desired. It is claimed that the carburettor, after once being regulated, gives a constant and steady supply of carburetted air, and that it can be employed for different sizes of motors, it only being necessary to enlarge or reduce the spirit outlet in the piece *F*.

Two Glasgow business men are at present making their usual "journey" throughout the South-East of Scotland on a motor-car. They arrived in Hawick the other day from Jedburgh, having covered the distance—including four stoppages—in seventy minutes.

## THE KHÜLSTEIN-VOLLMER MOTOR-TRACTOR.

WE illustrate herewith the latest vehicle placed upon the market by that energetic and always up-to-date firm, the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, W.

The illustration shows the tractor applied to a carriage of the hansom cab type, but it can, of course, be equally well fitted to any other form of carriage body, or, indeed, to any four-wheeled vehicle that is ordinarily drawn by horses, so long as the fore-part is of sufficient height to admit the tractor under it. By this means it is intended to provide automobilists with a means of using a number of vehicles of quite distinct forms, without going to the expense of having more than one set of motor-mechanism. It also affords a ready and cheap means of converting existing horse-drawn carriages or vans into motor-vehicles.

THE KÜHLSTEIN-VOLLMER MOTOR-TRACTOR.

The motor is of the double cylinder horizontal type, developing a maximum of 6 h.p., and its charges are electrically ignited. The power is transmitted from the crank shaft of the motor by belts, and the whole of the motor and transmission and speed-changing gear is contained in the casing shown. As the steering wheels are also the driving wheels, it follows that the turning of the vehicle is effected much more readily than is the case when the driven wheels are other than the steerers. In the present case every impulse of the engine assists the steering wheels on their designed course, whilst on rear-driven and front-steered cars the driven wheels taking the power are not running in strict accord with the curve given to the front or steering wheels. It is also held that in cases where the driven wheels are also the steerers there is very considerably less likelihood of the vehicle "skidding," owing to the fact that any undesired movement of travel can instantly be corrected by the steering device, whilst when the wheels of a rear-driven car skid, it is only possible to correct *their* undesigned movement through manipulation of the front wheels.

Additional power is gained in steering this vehicle by the fact that the construction of the turntable permits a full lock to be obtained.

The device is of German origin, and was used for some time on vehicles employed by the German Post Office for delivering and collecting mails. We are informed by the English agents that when attached to a delivery van this tractor has hauled a load of one ton on ordinary roads at a fair speed with perfect ease.

## The English "Hurtu" Car.

MESSRS. MARSHALL'S ENGLISH-BUILT "HURTU" MOTOR-CAR.

WE illustrate herewith an entirely new production of British manufacture possessing very considerable merits, and of handsome appearance. It is designed to seat two persons primarily, but four may be carried with ease, whilst an emergency seat gives accommodation for a fifth. The origin of the car is French, but the details of construction have been so very considerably improved and strengthened that in its British form it practically becomes a new type of vehicle. The comfort of the passengers has been studied in every way, and freedom from vibration, and comfort in seating are two noticeable features in this respect. The springs are ample in resisting vibration set up by road inequalities, and the fore-carriage is so arranged that, in steering, a  $\frac{3}{8}$  lock is secured, thus giving power to turn in a limited space. All four wheels are of the suspension, tangentially-spoked type, and are furnished with high grade pneumatic tires.

The motor is designed to give 4 h.p. effective, and is of the single cylinder horizontal type, with a bore of 5 ins. and a stroke of  $5\frac{1}{2}$  ins. Its normal speed is about 450 revolutions

per minute. Power is transmitted from the engine crank-shaft to an intermediate shaft by belts, and from thence by sprockets and chain wheels to the rear road-wheels by chains. The carburettor is of the surface contact type, constructed on a special system, whilst ignition is effected by means of an electric spark taken through a coil giving very high tension, from secondary batteries. Arrangements are made for timing the ignition apparatus, so that the explosion of the gases can be retarded or accelerated. The transmission gear gives two speeds, one of eight miles and one about fifteen miles, but these can be varied in either direction by controlling the sparking device. The belt guides for transferring the belts from fast to loose pulleys are fixed to a carrier running on wheels over transverse guides, thus ensuring both ease and rapidity in changing. The belt pulleys are flat-faced, but their faces have a large number of holes drilled in them, this being done to secure greater adhesion of the belts. Two brakes are provided, one a "jamming" brake as distinct from an ordinary band brake, which acts on the wheel hubs, and an emergency or shoe brake acting on the tires.

The overall dimensions of the car are: length, 7 ft. 6 in.; width, 4 ft. 8 in. The valves are easily accessible, and the springs can be quickly replaced, whilst all wear on bearings can be quickly taken up. The provision of a special form of exhaust box ensures silence in running, and the frame possesses great rigidity and strength.

The makers of this vehicle are Messrs. Marshall & Co., of Belsize Works, Clayton, Manchester, whilst the London Autocar Co., Ltd., of Gray's Inn Road, W.C., are the agents for London and the southern counties.

We congratulate both firms on the production of a thoroughly satisfactory, reliable, and extremely cheap motor-vehicle, possessing a graceful appearance, and being constructed on essentially British principles as regards strength, and quality of workmanship and material.

THE Waltham Manufacturing Co., of Waltham, Mass., U.S.A., has secured the rights of manufacture and sale of the De Dion motors in the United States.

MOTOR-CYCLES in Vienna, according to *Motorfahrer*, are to be placed in the same category as motor-vehicles, and cannot be ridden without a licence. The same regulation holds in France and Germany. A stamped request to use such machine must be addressed to the police authorities, after which the vehicle is tested by a commission consisting of an engineer and commissary of police. If all goes well the permit is issued.

A STAMPEDE of cattle in a busy thoroughfare in London is not a sight that can be witnessed every day; but such has occurred, and that, unfortunately, at the distinct expense of an elderly tricyclist who was leisurely riding his machine along Maida Vale, a well-known thoroughfare in the West of London. Everything was quiet and peaceful until a steam motor-wagon hove in sight, and created such a scare that some animals, which were quietly passing, took fright, rushed into the tricyclist, and knocked him down. Both legs were broken, necessitating immediate removal to the hospital. The machine was smashed to pieces.

THE automobile cab is to be introduced upon the broad asphalted streets of Washington. There are now fifty of the vehicles being built at Hartford, and the first will be delivered within a few days. They will be controlled by the syndicate which now owns nearly all the traction lines there. Some carriages will be sold outright and others will be put into service on the Charron plan now in vogue in Paris. By this plan the carriages are rented by the month and are accessible at all hours, being kept charged for immediate service and supplied with motor-men for their operation. The company also proposes to put into service a number of store delivery wagons.

LAST week, at the St. Martin's Town Hall, Mr. Troutbeck, the Westminster Coroner, held an inquest as to the death of a lady, named Mrs. Susan Brookes, aged sixty, who was killed by being run over by an electric motor-carriage in Shaftesbury Avenue on the 29th ult. The evidence was to the effect that at about twenty minutes past seven in the evening an electric motor dog-cart was being driven by its owner, Mr. Leitner, of 207 Piccadilly, W., down Shaftesbury Avenue, when the deceased crossed the road close to the cab-rank near Wardour Street, in front of the vehicle, and was knocked down. Inside the carriage was Major Rolleston, of Newark. The speed of the vehicle was stated to be a moderate one, and it was proved that Mr. Leitner, who himself drove the motor, sounded his "hooter" to warn the deceased when she started to go across the road. The old lady turned back, and then started again, with the result that the fore part of the carriage struck her, although an attempt was made to turn the vehicle aside before it reached her. She was removed to Charing Cross Hospital, where she died from her injuries. The jury returned a verdict of accidental death.

## SCOTTISH NOTES.

### Summer at last.

THE weather of the past week has forced upon one the fact that until recently some had good reason to doubt, namely, that "summer had come." For ten days in the Scottish midlands the sun has shone almost without a cloud to hide its brilliancy and often without a breath of wind to temper its heat. But for one thing the motorist can revel in such weather—no wind to impede the progress of his swift-moving car (the only breeze, caused by the rapid flight over the road surface, being delightfully cool and refreshing), no mud to clog his chains: nothing save the fine powdery dust which ere long mysteriously clothes both the car and its occupants. This, of course, is one of the trifling objections to distance travelling by road on vehicles of any kind, but it is certainly emphasised on a fast-running, rubber-shod motor-car. With suitable dust cloaks, however, the "touring party" suffers little personal discomfort or inconvenience, and he is more than compensated for his trouble at the journey's end in a thousand ways. To any of my readers who may be still undecided as to how and where they will spend their summer vacation I would recommend them to at once decide to spend it on a first-class motor-car in touring through the charming highlands and lowlands of "bonnie Scotland."

### Scottish Tours.

DURING the past week or so reports have reached me of parties engaged in "doing Scotland" by motor-car, and I have been frequently asked for information as to the best routes to be taken for this purpose. I have therefore decided to sketch out a few "Scottish tours" for the benefit of the readers of *The Motor-Car Journal*, to commence with next week's issue.

### Edinburgh Autocar Co., Limited.

THIS Company, the flotation of which I referred to last week, has, I learn, got successfully under weigh, and from the information I have its management does not mean to allow the grass to grow under their feet. They are already in possession of the new and spacious premises in Lothian Road, and the necessary alterations and fitting up of the property to adapt it to the needs of the Company's business are being pushed on energetically, and in a few weeks' time the whole of the concern, it is expected, will be removed from Abbeyhill to the new quarters, where every facility will be at hand for coping with the large and ever-growing business.

### The Scottish Club.

I HAVE this week heard some expressions of disappointment that the *pro tem.* committee which has the matter of the arrangements for an inaugural meeting in connection with the proposed Automobile Club in hand have not been called together since their last meeting on May 10th—more than three weeks ago. I have also heard that if Glasgow does not "hurry up" the go-ahead Edinburgh motorists will proceed to take the lead. Messrs. Mitchell and Smith, please note.

### Glasgow to London by Motor-Car.

I UNDERSTAND there is a proposal on foot to form a "touring party" to "motor" up to London next week to arrive in time for the opening of the Show at Richmond Park on Saturday, 17th inst. This would be a good opportunity for any who desire to have an experience of long-distance motoring. If a sufficient number apply, cars, I am

informed, will leave George Square, Glasgow, on Wednesday morning, 14th inst., at 6 a.m. Intending "tourists" should communicate at once with Mr. J. D. Brimlow, 21 Campbell Street, Hamilton. The fare for the double journey is, I believe, to be fixed at £3 10s., being equal to about the parliamentary railway rate of one penny per mile—certainly a very moderate rate. I understand Mr. John Stirling is driving up to the Show on the same date on the Stirling-Daimler dog-cart which has carried him on all his record rides during the past two years. He is as yet undecided whether he will travel by the East or West route.

**The Late Robert Cox, M.P.**

By the lamented death of Mr. Robert Cox, M.P. for South Edinburgh, the Madelvic Motor-Carriage Co., Ltd., of Granton, have been deprived of the services of a capable chairman and a gentleman who took a keen interest in the development of the motor industry in Scotland. For some time past he had not enjoyed the best of health, but he was always sanguine of his ultimate recovery. Before the business of the fortnightly meeting of the Edinburgh Town Council on Tuesday was begun, Lord Provost Mitchell made reference to the death of the Member for the Southern Division of the City, and dwelt upon Mr. Cox's philanthropic and public spirit, thereafter moving that the Council record its sense of the deep loss it had sustained as a city, and that the Town Clerk be instructed to forward a letter of condolence to Mrs. Cox. The proposal was unanimously adopted.

**Scottish Makers at the London Shows.**

I HAD an opportunity this week of inspecting some of the cars which are being prepared by Messrs. Stirling's Motor-Carriages, Ltd., of Hamilton, for the forthcoming London Shows, and I venture to predict that for elegance of design, quality of workmanship, and high finish, these will take some beating. The Victoria de luxe with the new Pennington motor which I saw in the finishing shop is one of the smartest carriages I have seen, and ought to prove a centre of attraction at the Shows. I understand this Company are exhibiting five Stirling-Daimler carriages and three Stirling-Penningtons. I believe it is also the intention of the Madelvic Motor Co., of Granton, to exhibit several of their elegant electrical carriages, but I have not yet obtained detailed particulars of the same.

**The Stirling-Leyland Steam 'Bus in the North.**

THE Stirling-Leyland 'bus on its journey through Stirling and Perth on its way to Dundee last week caused considerable excitement. It was the first vehicle of such dimensions to visit that part of the country. In the "fair city" it had an enthusiastic reception. Over the whole journey or some eighty miles the 'bus travelled splendidly and gave the utmost satisfaction.

**Motors at Muirkirk.**

THE Ayrshire village of Muirkirk was invaded by motor-cars on Saturday last, four large carriages arriving about noon with some thirty to forty "trippers" from Motherwell. While the "trippers" "picnicked" two of the cars were utilized to give the natives a treat in the form of short motor-car rides, which were, I understand, much liked by the said natives.

**Motor-Car at Hawick.**

A VERY pretty motor-wagonette is this week running in the Hawick district. It is fitted with the Daimler motor and appears to be in private use. The district is one in which motor-char-a-bancs could, I think, be run to some purpose.

"BROWN HEATHER."

**CORRESPONDENCE.**

**THE PANHARD CAR AT THE CRYSTAL PALACE CONTESTS.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having had a number of enquiries as to why my Panhard carriage did not come in for an award at the above contests (Class D), it may be of interest to state that when rounding a sharp corner at high speed one of the chains flew off owing to its being too slack (I had only arrived, by road, shortly before from Paris, *via* Newhaven, and being pressed for time neglected to properly adjust them); I then had to stop to replace the chain, thereby being disqualified and losing the medal. My time over the course, however, although I had to stop the car, dismount, replace the chain, and start again, was 6 min. 59 $\frac{3}{4}$  sec., or but 27 $\frac{3}{4}$  sec. outside the winner's time.

I was afterwards courteously invited to "go for record" at the termination of the van trials, but a marshal detained me at one of the stopping places to argue as to my disqualification, and it took a little while to convince him that I was not claiming a medal but merely going for time. I was also considerably delayed by one or two vans that had not got clear of the course. Yet my time on this attempt was 5 min. 34 $\frac{3}{4}$  sec., being well inside the fastest time of the other cars that took part in *any* of the contests.

Knightsbridge.

Yours truly,

June 3rd, 1899.

CHARLES S. ROLLS.

**IRREGULAR POWER FROM DE DION MOTORS.**

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I very much sympathise with Mr. Williams, and wish I could help him, as I have often been in a fix with my tricycle, and, being miles away from any one who could put me right, it was only by persevering for hours that I was able to find what was wrong.

For twelve months I rode a Beeston tube-ignition, and at the end of that time I could easily discover anything which was wrong. Now I have gone in for electric ignition, with consequently fresh complaints to diagnose.

Now, I think, Sir, if some of those who have had experience would give us a few tips upon what is likely to go wrong it would be a great help to novices. For instance, in my own experience the following have been sources of trouble:—

1. The gauzes between cylinder and inlet tube have become coated with carbon.
2. The washer at cylinder end of inlet tube getting loose and allowing air to be drawn in.
3. Within the past few days I put too much oil in crank chamber, consequently it got on to sparking plug and machine would not work. After cleaning plug about twenty times I at last took off cylinder cover and found a quantity of oil on top of piston. I cleaned this off and tried machine again, but still oil appeared on the plug. I took the cover off again and worked the machine on a block by means of the pedals, so that I could watch the piston. Oil worked up over the piston, and I thought new rings would be necessary. However, I put the cover on again and tried with three-quarter measure of oil. The machine went for about three minutes at a time, but there was no oil on the plugs, only a little soot; on cleaning this off the machine went for another three minutes, and I came to the conclusion that the batteries had become too weak. As a last resource I put in a third plug and the machine went beautifully. I found that in the other two plugs which I had been trying the platinum point which is inserted in the metal was loose, and I suppose oil had worked down by the side and spoiled the connection.

Will someone kindly answer the following questions:—

1. Should the platinum points be brazed into the plug?

2. How can one tell when the batteries are too weak, or how long they are going to last?
3. Should any oil appear on the top of the piston?
4. What are the internal connections of an induction coil as used on the De Dion tricycle?
5. In case of doubt whether the batteries have run down, could bichromate batteries be tried, and what size?

I must apologise for the length of this letter, but hope you will be able to find room for it.

Twynford,

June 6th, 1899.

Yours faithfully,

"NOVICE."

## MOTOR-CARS ON THE CONTINENT.

### Politics and Automobillism.

It is very much to be regretted that a few members of the French Automobile Club, and amongst them Count de Dion, took an active part in the manifestations which occurred on Sunday at the Auteuil races against the Government and the President of the Republic. Count de Dion was arrested soon after the manifestations commenced, but he was speedily released. Unfortunately, however, he was unwise enough to again take part, and was on these grounds again arrested and conveyed to prison, with many other personalities, in what is called in Paris "le panier à salade"—an entirely shut-up vehicle with very bad springs, which is generally used to carry members of the demi-monde to the police dépôt. More than fifty arrests were made, and amongst those so arrested were, we regret to state, Count Albert de Dion and about twelve other members of the Automobile Club of France. It is very much to be deplored that a few members of the Club should have taken part in such a discreditable affair, which threatens to have such a serious effect upon automobilism in France.

### The Automobile Club Closed.

ON Monday M. Cochefert presented himself at the Automobile Club on the Place de la Concorde at 2 o'clock in the afternoon, and announced that the Club was closed by order of the Police, and requested everyone present to at once depart preliminary to his sealing all the doors. It is certainly very extraordinary and absurd that such a step should have been taken against the Club, which has never taken any part in political questions or public ferments. The private acts of a few members should not be sufficient reason for forcibly closing a club which is, and will remain, let us hope, a purely social, commercial, and sporting affair. It is to be hoped that this extreme measure will not be permanent, and that the Club's handsome hotel, as well as its villa, will soon be permitted to be used again by that large body of members who have joined its organization on thoroughly *bonâ fide* grounds and solely with a view to the advancement of automobilism.

### Concours des Fiacres.

THE Concours des Fiacres which began on June 2nd has not produced any new vehicle, and the competitors taking part are nearly the same as those participating in the trials of last year. The present participants are Jeantaud, Jenatzy, Krieger, and Mildé, with electric vehicles, and Panhard and Levassor with a petroleum-spirit motor-vehicle. It is to be noted that Peugeot has not entered the competition, probably on account of the poor award made him last year, notwithstanding the extremely good performance of his cab. The first three days of the competition are devoted purely to scientific tests made to ascertain the most economical vehicle. The practical test of the vehicles on bad roads and inclines will be reserved for the last days of the competition. So far, the average speeds of the vehicles running through Paris have been a little over

15 km. an hour, which is a good result considering the heavy traffic and the very bad state of the streets, which are now torn up in every direction for works in connection with the Exhibition of 1900.

### Results of the Concours des Fiacres.

THE distance traversed by the cabs and light delivery vans was 60 kilometres, and this had to be negotiated not only through the dense traffic of the Paris streets, but also over roads very badly paved and quite out of ordinary condition owing to the vast operations now being carried on in regard to the Metropolitan Railway and other works in connection with next year's Exhibition. In addition to the time occupied in lunching, which is shown in the following table, each vehicle had an additional compulsory stop of thirty minutes. The results are given in the last column but one, and all stopping times are deducted; the times are therefore net.

| Description.                           | Time of Departure. | Déjeuner. |       | Time of Arrival. | Net Running Time. | Observers.       |
|--|--------------------|-----------|-------|------------------|-------------------|------------------|
|  |                    | From      | To    |                  |                   |                  |
| 1. Coupé Jenatzy 2 pl.                 | 9 4                | 1 8       | 1 50  | 3 13             | 4 57              | MM. Herbet       |
| 2. Victoria Jenatzy, 2 places          | 9 7                | 3 41      | 4 18  | 6 17             | 8 3               | Bardy            |
| 4. Light Parcels Van Jenatzy           | 8 56               | 12 38     | 1 45  | 1 45             | 3 27              | Colardeau        |
| 5. Cab Jeantaud, 2 places              | 8 58               | 12 2      | 1 2   | 2 14             | 3 46              | Tainturier       |
| 6. Victoria Jeantaud, 2 places         | 9 1                | 12 4      | 1 4   | 2 11             | 3 40              | Morin            |
| 7. Mylord Jeantaud, 2 places           | 9 3                | 11 58     | 12 58 | 2 3              | 3 30              | Guillaume        |
| 8. Light Parcels Van Mildé             | 8 24               | 11 50     | 12 54 | 2 12             | 4 14              | Diény            |
| 9. Victoria Krieger, 4 places          | 8 54               | 11 50     | 12 50 | 1 50             | 3 26              | Renaud           |
| 13. Coupé Panhard & Levassor, 4 places | 8 55               | 11 44     | 12 47 | 1 46             | 3 21              | Cte. des Essards |
| 14. Light Parcels Van Panhard & Levas. | 8 31               | 11 49     | 12 51 | 1 54             | 3 51              | MarcoMendoza     |
| 15. Drojsky Jeantaud                   | 9 0                | 12 3      | 1 30  | 2 8              | 3 38              | Plane            |

It will be seen from this table that of the two-seated passenger vehicles the Panhard and Levassor coupé took the least time to travel the course, being five minutes in front of the Krieger Victoria, with four seats, which in turn was four minutes quicker than the Jeantaud "My lord." The Jeantaud vehicles secured the next three places, in the following times: 3 h. 38 m., 3 h. 40 m., 3 h. 46 m. The quickest Jenatzy passenger vehicle took 4 h. 57 m., whilst another took no less than 8 h. 3 m. Most of the passenger vehicles seem to have performed a difficult task within very fair times, the average speed of the first group being over sixteen miles per hour. The light delivery vans also did well, in this instance the Jenatzy electric vehicle beating the Panhard by twenty-four minutes.

### The Antwerp Exhibition.

UNFORTUNATELY it cannot be said that the Salon du Cycle et de l'Automobile at Antwerp has proved successful. The public did not attend at all well, notwithstanding the fact that the prices of admission were reduced by 50 per cent. from those originally laid down. The exhibition was controlled and organized by a syndicate of sporting newspapers, and, judging from all accounts, the syndicate has managed to offend both exhibitors and visitors by insufferable pretensions. As a result only a few of the less important manufacturers have permitted themselves to be bound by the ridiculous regulations laid down. The public, learning that

the exhibition was neither comprehensive nor particularly selective from a first-class standpoint, refused to be induced to visit the show.

### The Voiturette Competition.

THIS competition over 100 kilometres of road between Etampes and Chartres was run off on the 6th inst. The entries were as follows: 1, E. Giraud (Bollée); 2, Jamin (Bollée); 3, Gros; 4, Wilfrid (Bollée); 5, Schmitt (Decauville); 6, Bian (Decauville); 7, Strutz (Bollée); 8, Cornilleau (Decauville); 9, Ravenez (Decauville); 10, Mourier (Decauville); 11, Aubin (Decauville); 12, 13, and 14, Three Nominees (Bollées); 15, A. Coutot. The order of arrival has not reached us up to the moment of going to press.

### The French Automobile Dictionary.

LIKE their English confreres, the French automobilists are considerably hampered by restrictions in language applicable to motor-car matters. They, like the English, as instanced by Mr. Shippey's letter in a recent issue, are on the look-out for terms, or rather words, which will correctly designate special types or styles of cars. M. Pierre Giffard asks that "dionbouton," "daimler," "phenix," "panhard," "bollée," "mors," "benz," etc., shall become common substantives to be correctly used in describing the cars to which they relate. These terms are certainly more harmonious to the ear than some recently suggested by an American *chauffeur*.

### "Le Fête des Artistes."

THE "Fête des Artistes," organized on June 2nd by the *Echo de Paris* proved a success and was favoured with splendid weather. The resulting profits were over 8,000 francs, and this is handed over to the charity fund for distressed dramatic artistes. The fête comprised amongst its attractions frequent processions of the cars all most beautifully decked and garnished with real flowers. The lady's driving championship was won by Miss Lea Lemoure for the second time, whilst Miss H. de Limoges secured second honours, and Miss Emma Montigny was happy in securing third place. We will not attempt to give a full account of the *défilé fleuri*, which was really magnificent—considerably over a hundred cars taking part in it—all the cars being very magnificently yet tastefully decorated. Many of the same cars took part next day in the Longchamps *fleuri* and battle of flowers.

### Mr. Winton's Challenge.

THE well-known American *chauffeur*, Mr. Winton, has challenged any man in France for a 1,000 mile race in the United States. M. Charron has immediately accepted it, and has written to the editor of the *New York Herald* enclosing a cheque for 20,000 francs as guarantee of good faith, accepting all the conditions laid down by Mr. Winton. There is but little doubt that M. Charron will prove the winner. He will be accompanied to the United States by M. René de Knyff.

### The Automobile Club of France.

THE Automobile Club is still closed, and is, as a club, "dissolved" by order of the police, and a guard of policemen surround the entry to the club house and that of the club villa on the Bois de Boulogne. Baron de Zuylen has interviewed the Prefect of Police, and made a request that the Club should be permitted to re-open its doors, giving definite assurances that politics had never been discussed at any of the Club's meetings. The Prefect declared he would transmit Baron de Zuylen's demand to M. Dupuy, President of the

Council. Count de Dion is still in prison, and will probably be severely punished both for his actions in giving utterance to political cries and for his resistance of the police. From the latest intelligence and official information courteously accorded us by the French Government officials, we learn that the Club has only been closed on account of Count De Dion's actions, and thus to punish him for the scandalous way he acted by closing an organization of which he is the leading spirit. It is very probable that Count De Dion will be obliged to resign from the club as vice-president, and also to resign the presidency of the *Chambre Syndicate de l'Automobile*, as well as that of the *Aéro Club*. We certainly think he ought to resign, and now learn that he has offered to do so, but we think also that his resignation ought not to be accepted, for it is nearly impossible to conserve automobilism without the help and strength of Count De Dion. Count De Dion is the one man who has worked and done the most in France for the development of the automobile industry, and no matter how bad may be his private life or actions it should not affect the welfare of the club, where nothing else but subjects connected with the mechanism and theory of automobiles were ever discussed. Fortunately neither the Club's Exhibition nor the *Concours des Fiâcles* will be affected in any way.

### Automobile Club de Belgique.

THE itinerary of the Bruxelles-Spa touring race is now definitely determined. After having ascertained all the particulars of the route the Committee is now dealing with the making up of the map and profile, which will shortly be placed at the disposal of the contestants. The final date for the receipt of entries is fixed for the 15th inst., and all entries should be sent to the Treasurer of the Automobile Club de Belgique, 5 Place Royale, Bruxelles.

D. FARMAN.

LAST week we had the pleasure of a twenty mile spin on the new Hurlu car, built by Messrs. Marshall & Co., Belsize Works, Manchester. The car can travel from sixteen to eighteen miles an hour, and mounts gradients well. Having pneumatic tires it is an easy running car, and being British built it is sure to command a large sale. The London agents are the London Autocar Co., Ltd., 182 Gray's Inn Road, W.C.

### "DRIVING TO THE COMMON DANGER."

AT Bow Street, on the 6th inst., Mr. Sidney Atkins, a director of the Automobile Association, of Prince's Road, Holland Park, and Fred Frenzell, an engineer in the employment of the Association, appeared before Sir James Vaughan to summonses charging them with having driven a motor-car to the common danger on Constitution Hill on May 19th.

Mr. Chaproniere defended.

The car in question was one of those which attended a motor-car meet at Whitehall on May 19th, but, becoming disabled, it was left behind on Constitution Hill, where, according to the police evidence, it caused great commotion and some danger, its erratic movements and the noise of its machinery frightening the horses passing.

Viscount Sudeley, captain of the Royal Horse Guards, now said that he was in charge of a troop of twenty-eight men proceeding from Whitehall to Hyde Park Corner at the time in question. As they passed the defendants' car the horses were frightened by the throbbing of the machinery. The car itself was not moving at the time.

In reply to Mr. Chaproniere, Lord Sudeley said that the horses were not very much alarmed. He had seen them equally frightened by other things.

Mr. Chaproniere called the defendant, Mr. Atkins, who said that the forward driving gear of the car had become fixed, so that it was impossible to drive the machine. They did once move it backwards in order, if possible, to release the clutch, but that was the only time the car moved, and as soon as the inspector spoke to him the machinery was stopped.

Inspector Hamilton, however, said that though the machinery was stopped when he spoke to the defendants at 11.45, at 12.10 it was started again.

Sir James Vaughan said that while he did not think this a case for a heavy penalty, it did not seem that the safety of the public was sufficiently considered by the defendants, and they would each be fined 20s. and costs.

## THE COST OF MOTOR-VEHICLE TRIALS.

IN order that our readers may possess some information of the vast expense incurred in conducting tests of motor-vehicles, we publish herewith the accounts of the 1898 Trials Committee of the Liverpool Self-Propelled Traffic Association. This gives an idea of the expense incurred, but affords no criterion of the vast amount of work involved, the whole of which was voluntarily carried out without remuneration by Mr. E. Shrapnell Smith, the hon. secretary.

THE American Electric Manufacturing and Power Co. has been incorporated in Dover, Del., to manufacture motor-vehicles to be propelled by air, electricity, gas, etc. The capital is £200,000.

AMONGST many others who laid themselves out to afford accommodation for the members of the Automobile Club on their Whitsun tour was Mr. C. T. Crowden, of the Motor Works, Leamington, who kept his machinery running in order to effect repairs if required or to charge batteries. The visitors were very much surprised to find Mr. Crowden so far advanced in the construction of some half-dozen cars, and were evidently astonished to find such well-equipped works at Leamington. We hope to illustrate some of the most recent of Mr. Crowden's productions in an early issue.

## SOME AMERICAN STEAM-DRIVEN MOTOR-VEHICLES.

By HORACE L. ARNOLD.

(Concluded from page 205.)

THE construction of Whitney's frame can be gathered from Figs. 18 and 19. Fig. 18 is a view of the front axle, which takes the form of a bow-string girder, carrying a tension rod below, and pivoted at the apex of the chevron-shaped top member to the front cross tube of the wagon frame, so as to swing freely in a vertical plane. To give fore and aft resistance, tubular braces are carried from each end of the front axle inward and upward, meeting in an eye which is pivoted to a second cross tube of the frame, in the same axial plane of rotation as the front axle, so that the front axle is perfectly free to vibrate vertically, and is at the same time abundantly braced in all directions. The pivoting of the front axle theoretically reduces the load lift due to road surface inequalities by one half, and is undoubtedly of the greatest value on rough roads.

The Whitney rear axle support is well shown in Fig. 19. It consists of a strong upper tube, bent downward at each end to form pedestals for the axle bearings, and provided on

FIG. 18.—WHITNEY'S FRONT AXLE, SHOWING STEERING LINKS AND THEIR CONNECTION TO STEERING LEVER.

the outside of these bent parts with brackets which support the two full elliptic rear springs. The front end of the frame is carried on a single full elliptic spring, as clearly shown. Two hangers dropped down from the rear cross tube of the frame support the rear axle on each side of the compensating gear. The boiler and engine move to give the chain adjustment, which is by a screw strut, as shown in Fig. 19. The Whitney frame is an admirable piece of designing, perfectly adapted to roads of any description, and the Whitney car rides more easily over a bad pavement than any other motor-carriage within the writer's experience. The brake drum and band are shown at the right in Fig. 19, and the brake treadle is shown in Fig. 20. Fig. 20 also shows Whitney's dashboard, with a steam gauge and gasoline tank air-pressure gauge, an index figure and graduated quadrant for indicating the depth of water in the water tank, and a mirror at the upper front corner, which reflects the glass water gauge shown under the seat in Fig. 21, half the seat curtain being turned up, as when driving.

The Whitney steering lever (see Fig. 20) involves highly ingenious devices of the greatest value, as they place the whole control of the wagon in one single spade-handle grip. This is a matter of the first importance. In an emergency, perhaps with death staring a driver in the face, it is not the natural thing to let go of one handle and endeavour to grasp another, nor is it the quickest thing to do. First of all the

spade-handle form of the grip makes the driver's hold secure against accidental displacement. The horizontal bar of the lever slides forward to place the valve gear in forward action, and pulls backward to back the carriage, and a slight rotation of the grip opens or closes the throttle valve. At an intermediate longitudinal position of the horizontally sliding grip bar, it is locked against rotation, and a large bell carried close to the grip can be operated by the thumb to give

FIG. 19.—WHITNEY'S REAR AXLE, SHOWING CHAIN WHEEL AND BAND BRAKE.

warning signals. A ride of some hours' duration through the busy parts of Boston's crowded, crooked, narrow streets convinced the writer that in this universally acting single lever Whitney has produced one of the most valuable of all possible minor adjuncts to the successful use of the motor-car. Whitney can move his carriage a single half-inch forward or backward with perfect certainty. Meeting a wagon in Avery Street, which is not more than 6 ft. wide

FIG. 20.—WHITNEY STEERING LEVER AND PRESSURE GAUGES.

between curbs, Whitney instantly backed the carriage into a cross alley in a manner almost impossible to realize; and the Whitney car can probably be driven across Boston in half the time required by a horse-drawn carriage, because of the absolute perfection of control due to this universal steering lever. Whitney's best speed with this car is a mile in a little less than two minutes. He has driven from Boston to New York, 236 miles, inside of eighteen hours, and the writer believes the Whitney wagon could average 150 miles per day in a trip between Boston and San Francisco, with the roads as they are.

Fig. 22 shows Whitney's boiler, which is made with a projecting steam chamber in which the cylinders are placed as indicated. Whitney threads the tubes into the tube sheets

with a long tap, 50 p.i. double V-thread, which makes the same thread depth as if the pitch were 100 p.i. One end of the copper tubes is enlarged about 1.32 in. diameter, so that the small threaded end of the tube can pass through the

FIG. 21.—VIEW UNDER SEAT OF WHITNEY'S STEAM CARRIAGE, SHOWING GAUGE, GAUGE COCKS, ETC.

larger diameter tube sheet tapped holes without touching. After the tubes are screwed in place, these tube threads being straight not tapered, the tubes are expanded with a 3-roll expander, common form.

Taking these four steam cars together, they burn kerosene, not gasoline, make no noise, show no steam and emit no odour, do not frighten horses, do not require any blower or other forced draughts, and the driver has only one

FIG. 22.—WHITNEY'S BOILER. 14 IN. DIAMETER AND CONTAINING ABOUT 300 COPPER TUBES  $\frac{1}{2}$  IN. DIAMETER, 13 IN. LONG; SHELL  $\frac{1}{8}$ -IN. THICK STEEL PLATE; TESTED TO 500 LB. HYDRAULIC PRESSURE.

hand engaged, with one foot ready for action on the brake, leaving one foot and his right hand free.

Taken singly, none of these carriages do all of these things, and it is not certain that the Stanley burner will burn kerosene with any degree of success.

But most unquestionably a steam motor-car, operating on less than one-third of a cent per mile for fuel, and weighing well under 450 lb. empty, under perfect control, absolutely safe, and capable of being sold at a handsome profit for 600 dols., is a long step in advance of anything in the way of mechanically-propelled vehicles of unlimited range previously shown. With such light weights the pneumatic tire is durable, and with such low fuel consumption, and such small first cost as Stanley proposes, the immediate use of a vast number of these vehicles seems certain.

# The New French Steam Motor-Lorry.

FIG. 1.—MESSRS. PIAT &amp; SONS' STEAM MOTOR-LORRY.

THE accompanying illustrations, Figs. 1, 2, and 3, show a new steam motor-lorry, which has been built by Messrs. Piat & Sons, engineers, Paris. The vehicle is of metal throughout. Its principal dimensions are: Length over all, 28 ft.; wheel base, 13.6 ft.; diameter of front wheels, 3.08 ft.; diameter of rear wheels, drivers, 5.28 ft.; gauge, 6.75 and 8.13 ft.; breadth of tires, 5.9 and 7.0 in. In this vehicle the boiler is located at the rear, the mechanism being in front of it. The total weight in working order is said to be 8 tons,

cent. in both cylinders. The distribution is effected by a single eccentric arranged on the Gooch system.

As will be seen from Fig. 3, the motor shaft is placed longitudinally, and is provided with two fly-wheels *VV*. It transmits motion through the bevel wheel *B* to the intermediate shaft *A* (Fig. 2). Upon this shaft is keyed a wheel *E*, which gears with another wheel carrying the differential *C*, mounted upon the driving shafts *DD*. To transmit the power to the rear road-wheels without using

FIG. 2.—SECTION THROUGH REAR OR DIFFERENTIAL AXLE.

the usual load being between 5 and 6 tons; the speed on the level is  $6\frac{1}{4}$  miles per hour. The generator, which is arranged to work with either wood, coal, or coke as fuel, is of the vertical water-tube type, and carries steam at a working pressure of 142 lb. per square inch. There are no less than 117.8 sq. ft. of heating surface, the maximum evaporation being 1,507 lb. of steam per hour. The feed-water tank is carried under the platform, and it has a capacity of 28.6 gallons. The motor is a two-cylindrical one inclined at an angle of 45 degrees. The dimensions of the cylinders are: diameter, 6.299 in.; stroke, 5.9 in. Steam is cut off at 65 per

FIG. 3.—DIAGRAMMATIC VIEW OF ENGINE.

chain gear a special mechanism is employed. The road-wheels are of iron, and are keyed to their respective axles *FF*, which run in long axle boxes. Each axle box is attached by means of an arm to a hinged joint *G* (Fig. 3); between the inner ends of the shafts *FF* and the outer ends of the differential shafts *DD* is interposed an arrangement of links and discs *M* and *I* (Fig. 2), thus permitting a certain amount of vertical play to take up road vibrations due to inequalities in the roads.

## PETROLEUM MOTOR-VEHICLES.\*

By JAMES D. ROOTS, M.I.M.E.

(Continued from p. 206.)

About this period Messrs. Petter, of Yeovil, attacked the problem of petroleum road locomotion, and, like the author, endeavoured to use oil for the propulsion of their vehicle. They built a vehicle for the Crystal Palace *Engineer* competition, at which it was exhibited and ran fairly well. Figs. 27 and 28 illustrate this vehicle, except that Fig. 28 shows a balance gear upon the countershaft, and the vehicle at the Crystal Palace had no balance gear, and drove by one back wheel only. *A*, *B*, and *C* are pulleys upon the crank-shaft which drive the pulleys *A*<sub>1</sub>, *B*<sub>1</sub> and *C*<sub>1</sub> upon the countershaft *H*. *A*<sub>1</sub> is the high-speed pulley, *B*<sub>1</sub> the low-speed pulley, and *C*<sub>1</sub> the reversing pulley. *M* *M*<sub>1</sub> are the two cylinders of the motor. *N* *N*<sub>1</sub> are the crank pins. *G* is the balance gear, *J* *J*<sub>1</sub> the chain

FIG. 27.

pinions driving the chain wheels *K* *K*<sub>1</sub>, which are fixed to the road driving wheels of the vehicle. The jockey pulleys *D* *D*<sub>1</sub> and *C*<sub>1</sub> tighten the straps upon the high speed, low speed, and reversing pulleys respectively. The jockey pulleys are operated by means of the lever *E*. *F* is the pedal to actuate the reversing pulley. *L* is the foot lever for the brake.

Fig. 29 shows the primitive method of vaporisation employed in the cylinder. *A* is the combustion space, *B* the oil cock, *D* the oil channel, *F* the air hole, *E* the inlet valve, *I* the ignition tube, *J* its casing, *M* the

FIG. 28.

burner. The oil cock being turned on the oil is simply swept into the combustion space through the inlet valve by the air. It will be seen that no efficient system of vaporisation was adopted. The oil was swept into the hot cylinder cover, and until the cylinder and the surrounding parts had reached a high temperature it would not be possible to run without much smoke. The author is informed that Messrs. Petter have discontinued their attempts to produce a successful oil motor vehicle †

Fig. 40 shows a recent type of Benz motor-vehicle. Fig. 41 shows the motor in elevation and plan. It is of about 1½ brake horse-power at a speed of about 560 revolutions per minute. *C* is the jacketed cylinder having a steam condenser or receptacle fixed to the top of it. *N* is the crank shaft, *B* the connecting rod, *PP* the driving pulleys fixed to the crank shaft, *E* is the exhaust valve operated by the cam on the half-speed gear wheel. The cylinder end is open to the dust of the road, which cannot conduce to the durability of either the cylinder or piston. The charge is ignited by two cells and an induction coil. There are two ordinary

platinum points inside the combustion chamber. On comparing the Benz first car with the illustration of this car (Fig. 39) the lines of development and improvement will be seen. *A* is the motor, *B* the steam condensing cylinder, *C* the carburettor, *D* the crank shaft, *E* the petroleum spirit tank shown dotted, *FF* the water tanks, *G* the low-speed belt, *H* the high-speed belt, *I* the countershaft, *JJ* the driving chains, *KK* the back or driving wheels, *L* the exhaust box, *M* the steering lever, and *N* the throttle valve.

One of the first of a type of cars which was built by the author's firm in March, 1898, and which since that time has been in continuous use, has in all probability travelled about 7,000 miles without showing undue wear in any part to impair its efficiency or satisfactory working. In fact, only the rubber tires and the varnish on the body show perceptible wear. This

FIG. 29.

car was frequently tested for consumption of oil, which was found to be only six pints of oil (Tea Rose, for which 4½d. per gallon was paid) for every twenty miles. The running cost of this 3-h.p. car, therefore, works out at about 168 pence, or 14th of a penny per mile. The motor driving this car is the same as that shown on Messrs. Roots and Venables' four-seat car previously described, but with a few detail improvements, which have increased the power and eliminated the smell. From this 3-h.p. twin-cylinder motor, 4.2 brake horse-power at 600 revolutions is now obtained with a perfectly clean exhaust. The safety and freedom from explosion of the oil in comparison with the danger and continuous liability to fires in the use of petroleum spirit need not be expatiated upon, as it will be obvious to everyone.

(To be continued.)

## ALLEGED BREACH OF CONTRACT.

IN the Queen's Bench Division of the High Court, the Pneumatic Brake Company, Ltd., brought an action against the Australian Cycle and Motor Company, Ltd., on Wednesday, before Mr. Justice Darling and a common jury to recover damages for breach of a contract to accept deliveries of pneumatic cycle brakes.

Mr. C. A. Russell, Q.C., and Mr. Macleod appeared for the plaintiffs; and Mr. Dickens, Q.C., and Mr. Gore-Browne for the defendants.

On December 3rd, 1896, according to the plaintiffs' case, the defendants by a written agreement, in consideration of being the sole agents in Australasia for the sale of articles manufactured by the plaintiffs, undertook to purchase from the plaintiffs 5,000 pneumatic brakes a year for five years at prices agreed upon for the first year and to be fixed in each succeeding year for the rest of the period. Three hundred brakes were supplied under the agreement in February, 1897, and were paid for. The defendants were dissatisfied with the brakes supplied, complaining, among other things, that the rubber of which they were made was unable to withstand the heat of the Australian climate. A correspondence ensued, the effect of which was, according to the plaintiffs' contention, that the defendants repudiated the contract. The plaintiffs now sued for the loss of profit they would sustain by the defendants' breach of contract. The defendants' case was that the brakes supplied by the plaintiff were defective and unsaleable and unfit for use in Australia, which was known by the plaintiffs to be their

\* A paper read before the Society of Engineers, May 1st, 1899.

† The author next described the well-known Daimler, De Dion, and Bollée vehicles.—Ed. M.-C. J.

destination, being made of inferior rubber; but that they were always willing to accept delivery of saleable goods. They contended in the alternative that they were only liable to pay damages in respect of the first year, because no price had been fixed for the brakes to be delivered during the remaining years. They counter-claimed for damages for the plaintiffs' breach of contract in supplying unsaleable goods. The plaintiffs replied that their brakes were sold under a patent or trade name, and that there was, therefore, no implied warranty that they were saleable. They suggested that the real reason of the defendants' repudiation of the contract was that in 1897 a "slump" set in in the cycle trade and that they were, consequently, anxious to get rid of the liability to take the brakes. The following questions were put to the jury, to which the answers are appended:—(1) Were the 300 brakes supplied by the plaintiffs to the defendants of merchantable quality and reasonably fit for the purpose for which they were supplied (a) when they left this country? Answer.—Yes. (b) When they reached Australia? Answer.—No. (c) Were they ever fit for use in Australia? Answer.—No, through damage in transit. (2) Were the brakes supplied of the same make and quality as those supplied to the plaintiffs' customers generally? Answer.—Yes. (3) Were the brakes supplied made of inferior rubber? Answer.—No. (4) Did the defendants refuse to order more brakes and to finish the contract? Answer.—Yes. (5) If so, what damages were suffered by the plaintiffs (a) in respect of the first year? Answer.—£200. (b) In respect of the remaining years? Answer.—Nil. (6) Were the defendants ready and willing to order goods if reasonably satisfactory goods were supplied, which were reasonably fit for the purpose for which they were ordered? Answer.—No. (7) Were the defendants unable to sell the brakes supplied to them? Answer.—Yes, because they were damaged in transit. (8) If so, what damage did they suffer? Answer.—Nil. Upon these findings judgment was given for the plaintiffs for £200, and the counterclaim was dismissed.

#### UNIVERSAL MOTOR-CAR AND CYCLE COMPANY.

IN the Companies Winding-up Court last week, before Mr. Justice Wright, the petition of Mr. E. J. Morris for the winding-up of the Universal Motor-Car and Cycle Company came on for hearing. Mr. Wheeler, in support of the petition, said the Company had ceased to carry on business. It was formed in June, 1896, with a capital of £200,000, of which £102,000 had been paid up. Mr. Cozens-Hardy, for the Company, said they were carrying on business and had assets. Mr. Wheeler said the Company was originally called the British Motor-Carriage Company, but it had been restrained by injunction from using that name. The petition stated that the whole of the Company's capital had gone, and that there were no assets. Its business had been suspended for more than a year, and for more than six months before there had been no meeting of directors. The petitioner was the owner of fifty fully-paid shares. There was a sum of £16,000 due for calls, and there was also a probability of something being recovered from the directors. The petition, counsel added, was supported by another holder of fifty fully-paid shares. His Lordship enquired what benefit the petitioner would get from an order. Mr. Wheeler replied that the petitioner wanted enquiry into the conduct of the Company's business. The directors had taken £2,000 in fees. Mr. Cozens-Hardy: All of which has been returned. Mr. Cozens-Hardy stated that the affidavit of the accountant (Mr. Perrin) showed that meetings had not been held because the Company were not in a position to know the value of their assets. It was untrue to say that the Company had none, for negotiations were in progress to realize valuable assets, consisting of several patents. The business had not been carried on because of pending litigation. Nor was it true that no meeting of directors had been held for six months, two having been held in March last. He submitted that it would be against the interest of the Company's shareholders to wind-up the Company. Mr. Wheeler said the Company was formed to acquire and work patents for motor-carriages, cycles, flying machines, etc. Certain of the patents were valueless. His Lordship said, as between the petitioners and the Company, it was difficult to say which had the weaker case, but the balance appeared in favour of the Company. In the circumstances, he did not think the holder of fifty shares should say to the Court that the venture was a bad one, and there was great reason to doubt whether he would get anything by a winding-up order. He should dismiss the petition, but without costs.

#### Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797.

LARGE STOCK of Motor-Car Tricycle Frames, with all latest improvements; two band brakes, cased-in pattern axle, free chain, hubs and pedals, and all connections ready to attach to motor; electric connection in handle-bar; highly enamelled and plated.—Brown Brothers, Ltd., Great Eastern Street, London, E.C.

MOTORS ON HIRE.—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

#### SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

FOR SALE.—Electric Victoria, quite new, made by Thrupp and Maberly of London, the motor by Immish & Co.; in first-class condition. Price £200. For further particulars and order to view apply to C. A. Goffin, Minehead, Ouseley Road, Balham, S.W.

FOR SALE.—Mytholm Motor-Car, double cylinder, 3-h.p. petrol motor, three speeds, ball bearings, rubber tires, £110. Photo, three stamps. Also 8-h.p. two-cylinder Mytholm Petrol Motor, complete with tube ignition and carburettor, £55. 3-h.p. two-cylinder Mytholm Petrol Motor, £32.—Brown & Buckton, Hipperholme, Halifax.

WANTED to Hire, by a Dental Practitioner in Ireland, a small Motor-Car or Tricycle, suitable for two persons. De Dion preferred.—Apply Box 101, Motor-Car Journal, 39-40 Shoe Lane, London, E.C.

FOR private use or passenger traffic.—Benz Phaeton with box seat for driver, handsome carriage, leather hood and aprons; seat six; been little used; in good order; will accept £195.—Apply by letter to H. S. Eyre, 6 Grosvenor Gardens, St. Leonards-on-Sea.

3 H.P. COVENTRY MOTETTE, carry two persons, English manufacture; cost £150, will accept any reasonable offer; good condition.—C. Watson, 97 Upper Stone Street, Maidstone.

MOTOR-CARRIAGES, deliverable directly, system Panhard, Benz, Peugeot, Mors, Decauville, Cambier, Rochet, Silmeider; tricycles.—Apply to Géo. de la Nézière, 51 rue Vivienne, Paris.

WANTED.—Situation as Driver and Repairer of Motors. Seven years' experience in making, driving, and repairing explosion engines and cycles.—E.W. Dewbury, High Street, Ware.

#### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

### The Club Trials.

THE Automobile Club's tests are now a thing of the past, and full particulars of the proceedings will be found in other columns. The weather during the trials has been lovely, and all round the events have been most enjoyable; but it seems astonishing the lack of public interest taken in the proceedings, and also the absence of interest by the members of the Club themselves. At no time, apart from the competitors, has there been above a dozen members present. The success of the trials has been in a great measure due to the keen interest taken by Sir David Salomons, and also the energy of the assistant secretary, Mr. Joy. Mr. Beaumont and Mr. Shrapnall Smith have also busied themselves, and been present daily, doing judges' work, in testing the consumption of petrol, water, steam, etc. Regarding the trials, Petersham Hill, near London, was certainly a convenient spot upon which to have trials, but better hills where greater tests could have been made are to be found elsewhere not very far from London. We fear the tests will not prove much, any more than will the fifty-mile trials. It seems to us absolutely ridiculous that the cars should be limited to the five minutes a mile average. We absolutely saw cars dead-stationary, stopped for the purpose of filling up time. The car we were on—an 8-h.p. Benz—went through without stopping, but it travelled on the Crypto gear a good deal, and we were afraid some of our miles were as fast as 4 m. 40 s. There was one car on the journey we were very anxious to see do the fifty miles under test, but it was impossible under the circumstances for us to get any satisfaction. The Lanchester car, of which were expected great things, inasmuch as it carries no water, we had wished it could have ridden the fifty miles non-stoppage. But the observer, an engineer, Mr. S. Terry, carried out to the letter his instructions, and practically stopped the car at every milestone. The heavy trials were very satisfactory, and the success of every vehicle participating in the event was most gratifying. But here, again, the law stood in the way, and more than one vehicle had to be stopped to prevent it exceeding the legal limit of time. The trials themselves, we consider, will not prove anything, and the lack of interest taken by the public and the press will not have enabled the Automobile Club to have done much good, although of course the Club's intentions were of the best. The members themselves during the trials, as previously stated, were conspicuous by their absence, and considering the circumstances under which the trials have been held it does not augur well for the future of other events which may be promoted by the Club.

### Light Motor-Carriages in America.

Just as in this country, builders of motor-vehicles in America are beginning to devote attention to the production of a light two-seated motor-carriage capable of being sold at what may be termed a popular price. In its recent issue, our New York contemporary, the *Horseless Age*, describes

a new car of this type which has lately been introduced by Mr. W. T. McCullough, of the Back Bay Cycle Co., of Boston, Mass. The general appearance of the vehicle differs considerably from those in use in this country, the body of the car being not only mounted higher than we are accustomed to on this side, but is of an exceedingly light character. The motive power is supplied by a two-cylinder horizontal petroleum-spirit motor of about  $4\frac{1}{2}$  h.p. The motor, which weighs about 100 lb., is located in the front portion of the frame. Radial discs are fitted to the cylinders for cooling purposes, while ignition is electrical. The two cylinders are arranged to work independently of each other, so that when desired one of them may be entirely thrown out of gear. As regards the transmission mechanism, only one forward mechanical speed is provided, intermediary speeds being obtained by the variation of the explosive mixture and the electrical ignition. From the motor shaft to the intermediary shaft, the power is transmitted by means of a chain working on sprocket wheels, while from the intermediary two light driving chains, fixed not at the ends but centrally, transmit the power to the rear road wheel axle. A small friction clutch is arranged to work in conjunction with the sprocket wheel on the motor shaft so that the motor can be entirely disconnected from the transmission gear. Steering is effected by means of a long bar, the vertical standard, instead of passing through the floor of the car as is usual, being fixed just in front of the splashboard directly over the front axle. The frame of the vehicle is constructed of cast steel, and the body suspended thereon by strong springs. The four road wheels are all 32 in. diameter; they are of the cycle type, fitted with pneumatic tires. It is claimed that a speed of twenty-five miles per hour can be obtained by the car, which weighs complete just under 5 cwt.

### Motor-Car Racing.

PENDING the formation of a properly constituted and representative control body of racing motorists the committee of the Motor-Car Club, we are informed, are prepared to investigate claims to record and to certify as to their correctness. All claims, together with timekeepers' certificates, should be sent to the hon. secretary of the Motor Car Club, 40 Holborn Viaduct. The first official timekeepers appointed are Mr. F. T. Bidlake and Mr. F. W. Baily.

### Five Minutes a Mile.

THE Hon. S. C. Rolls' 8-h.p. Panhard has been called a fire engine, a "hippopotami," and other wicked names, but as a fire engine it will no longer be known. Mr. Rolls has gone in for something sweet—chocolate, in fact—and in future the car's progress will not gain notoriety from the brilliancy of its colour—or its speed, we should imagine, judging from the delicious look of calm contentment on the owner's face during the five-minutes-a-mile contest on the Oxford Road. It was almost worth the misery of the "cripto gear" speed to enjoy the sight.

### A Motor-Car Paper Chase.

ON Saturday last the Motor-Car Club held an inaugural and most successful paper chase. The journey was started near Coulsdon on the main Brighton road, and was continued through some miles of devious lanes over Banstead Heath, and after many twists and turns finished up at a point on the Brighton road. The course was an exceedingly difficult one, and some tremendous hills had to be negotiated; consequently, speed was out of the question. The hon. sec., Mr. F. W. Baily, arrived home first on a De Dion tricycle, with Mr. Miles second on a Benz car. The fast tricycles, ridden by such flyers as Messrs. Jarrott and Wridgway, overran the trail several times, and arrived in—well, at the tail end. It was very amusing at a spot near Banstead Heath, where a false trail led down a steep hill, to see a number of members flying down and having to wearily push their machines up again, as the hill was too steep to ride. The last man eventually turned up some three hours after the winner, and everyone had experiences to recount of the difficulties of the course. A number of the members afterwards dined at Reigate in the evening, and proceeded on the Sunday through Dorking on to Shire for luncheon, from thence on to Ripley, and so back to town, terminating an exceedingly enjoyable outing. It is intended to hold another paper chase very shortly, and any motorists wishing to take part are requested to communicate with Mr. F. W. Baily, hon. sec., Motor-Car Club.

### FURIOUS DRIVING AND A SPILL ON THE STAFFORD ROAD.

At the County Petty Sessions, Wolverhampton, on Monday last, before Messrs. Dickinson and J. Marston, Joseph Lisle, a young gentleman, and son of Mr. Edward Lisle, of Mosely Hall, Wolverhampton, was summoned for driving a light locomotive on the Stafford Road at a faster rate than twelve miles per hour. Mr. T. P. Haslam (Messrs. G. R. Thorne and Haslam) defended.

Police-Constable Poulson said that on Sunday, May 28th, he was in the garden at his station when he saw the defendant driving a motor-car along the Stafford Road towards Wolverhampton. The defendant and his father were in the car, which was being driven between sixteen and twenty miles an hour. Witness subsequently saw the father and son at Mosely Hall, and in the course of a conversation the remark was made, "We were going above the average rate."

Thomas Webberley, butcher, Chapel Ash, said that on May 28th he was driving a mare attached to a trap along the Stafford Road, and after getting past the "Ball Inn" at Coven he saw a motor-car coming towards him at a rate of about twenty miles an hour. Witness's horse became restive, and he put up his hand before the car reached him. The motor-car was being driven along the middle of the road, and Mr. Lisle and his son were in it. Witness pulled his horse up almost to a standstill, but the defendant did not slacken the pace, and the horse turned the trap over. Witness was thrown out, and his daughter was thrown into a ditch. The trap was damaged and the horse's legs cut. He had instructed his solicitor to write for damages.

John Griffiths, of 306 Prestwood Road, Heath Town, who was cycling on the Stafford Road on the occasion, said the motor-car was driven about sixteen miles an hour. Witness rode from ten to twelve miles an hour, and the car left him. The motor-car did not collide with Mr. Webberley's trap, but must have frightened the horse when it passed close to it.

Harry Brown Birch, of 391 Prestwood Road, Heath Town, another cyclist, said the motor-car was being driven at sixteen miles an hour.

Mr. Haslam said it appeared that another claim was going to be made against them in another court. The motor-car was going, perhaps, at a faster rate than ten miles an hour, and Mr. Webberley was trying to urge his horse past and never gave a signal to those in the motor-car. Afterwards Mr. Lisle saw that an accident had happened, and he stopped and got out of the car, but thinking that the car might frighten the horse again he did not go back.

Mr. Edward Lisle, called as a witness, said that the pace of the motor-car fluctuated. They had gone up to a canal bridge, and on descending the other side the pace increased. If a signal had been given they would have pulled the car up at once.

Mr. Dickinson said that the magistrates believed the car was being driven at more than twelve miles an hour, and defendant would be fined 40s. and costs.

Mr. Marston said they did not wish to discourage the motor-car industry in Wolverhampton; they were glad to see it; and hoped it would remain, but motor-car drivers must obey the law.

### NOTES FROM THE MIDLANDS.

By "VERAX."

#### An Impostor.

"THE world was ever thus," and at last we have to encounter the professional beggar as an "inventor" of a system whereby motor-cars can be propelled at thirty miles an hour without "oil, steam, smoke, smell, heat, stink, or noise." This gentleman has, of course, a shabby appearance but a highly persuasive manner about him, and produces (inventor fashion) a roll of drawings from his pocket; they are very roughly drawn, of course. The drawing presented to me represented a sort of Pelten wheel with sliding weights, etc.; in fact, a sort of perpetual motion device, with a large weight shown at the end of a long lever, which acted on the brake drum. This powerful brake was absolutely necessary to stop the motor, owing to its great power. In fact, I was told that a car had been fitted with such a motor, and was travelling at thirty miles an hour along the Brighton road when the unfortunate accident took place, for want of brake power, that had cost the persuasive gentleman three ribs, and shock to nervous system, etc. After this has been explained at full speed, an opportunity arises for the victim to explain that this all sounds very nice, but of course is absolutely useless in practice, and so on; and then the persuasive gentleman becomes sorry that you are unable to grasp the utility of his invention, and hopes you will not be unwise enough to let slide the grand opportunity you have of becoming one of the syndicate, which, of course, is to be formed of the most influential gentlemen in the motor-car world, who have notified their intention, etc., of securing the patents for every country. It is at the end of this explanation that the persuasive one comes to the real object of his visit, which is to inform you that he is very sorry but having come all the way from some important town not far away especially to see you, and on the instigation of some large firm really interested in motors, he has unfortunately run short of petty cash, and would be so much obliged if you would lend him five shillings just to pay his fare back, and so on. Of course, the money will come back to-morrow, when he purposes to bring his powerful models for your inspection. Needless to say, this is simply a begging scheme, as in my case I had the opportunity to prove it, and advised the persuasive one to leave the town at once. I hope readers will be on the look-out for this gentleman, who is a little old man, with his subject at his fingers' ends. I presume he has an enormous number of names, and the various towns he is so very anxious to return to would in the course of a day's work be numbered by hundreds. His motor is, of course, "applicable" to everything, from chaff-cutting to record Atlantic passages; so he has would-be victims in every walk of life. The best way to deal with him is to afford him the opportunity of describing his invention before a magistrate, which would give him the notoriety and subsequent retirement from business which he deserves.

#### Motor Exodus from Coventry.

ON Thursday last some cars of Coventry production went up for trial and exhibition at the shows in London, and thirteen or fourteen cars started away for London via Dunchurch. The "procession" was, to say the least of it, a very imposing one at the start, and various types fitted with Daimler motors were represented. The huge Post Office vans went along very gaily and looked fairly smart in appearance, though, of course, very heavy. There was also the light Daimler carriage for two people. Coming along in the distance this carriage does not strike one as being so small as it really is, presumably caused by the massive appearance of the motor bonnet in front. However, this car with its 3-h.p. double cylinder motor is capable of a very good speed, and is a good hill-climber, and will no doubt cause much

attraction at the show. The Daimler ordinary type of car still seems too heavy altogether, and surely could easily carry a 6-h.p. motor instead of the 4-h.p. usually fitted.

#### Motor-Car Experiments.

COVENTRY manufacturers are very busy and keen on the development of the smaller motor-car, and at present do not care for others to know exactly what they are doing, as naturally they do not want to give their ideas away.

For this very reason several really good little cars will probably not find their way to the shows this year, and will not be allowed out of sight until they are absolutely out of the experimental stage. This is as it should be, as it is evident that many firms have been too premature in selling or offering for sale their cars before they were really in a reliable state for selling, and, of course, this sort of thing is bad for the industry at large. However, steady progress is being made, and on the quiet Warwickshire lanes are to be seen all sorts of cars, in all conditions of finish, being tried and perfected for the market. It is by no means an easy matter to make a satisfactory motor-car, as many firms have found out; and as faults, which render a whole frame or engine absolutely useless, only become evident on the road and not in the drawing office, it stands to reason that a great amount of money is being sunk, which, I am afraid, some firms will never see back again. On Friday last Mr. C. G. Wridgway was in Coventry, and it will be interesting to note that Messrs. Pennington & Baines have secured his services for five or seven years in their Continental branch. In the course of conversation we understood that Mr. Wridgway was leaving for Paris, to take up his duties there, and that he had already disposed of seventeen motors. Nothing has been seen in the Midlands of the new Pennington motor, but perhaps it will come, all in good time. I understand Mr. Wridgway returns to England shortly to engage in another competition at, presumably, the Crystal Palace, where he has already competed with success.

#### Motors and Prejudice.

THE Automobile Club's visit to the Midlands was of course an event of importance to all interested in the development of motor traffic, but it did not succeed in removing all the prejudice which exists, and in some cases

only increased it. One gentleman, who is well known in Leamington, informed me that the air was so thick with smoke and obnoxious fumes as the cars left the Regent Hotel yard, that every resident had to clear out; in fact, the place was untenable during the three days' stay of the Club! Had he anything to do with the Legislature he would prevent such intolerable nuisances, etc. Happily, these gentry are now very few and far between, but their opinion is still looked for and carries a certain amount of weight, as this sort of rubbish is talked in certain local Council meetings, and over the everlasting cup of tea with Mrs. Grundy. Of course, the reverse was really the case, as the streets were lined with an admiring crowd, some of whom had come a considerable distance to see the cars, and throughout Warwickshire the greatest disappointment was evinced by people who had just turned up too late to see the "procession," as they thought it was intended to be. Warwickshire is, of course, a very horsey county, most of our highways having horse tracks as well as footpaths, which is quite a feature of the county. One old farmer said he was quite unable to see the use of these mechanics' carriages, as he called them, which took you along so fast that it was quite impossible to look at the country, which he apparently considered was the sole reason why the roads were made at all. A great many people object to motors on account of the dust they create. People naturally ask: "Why should a motor make more dust than an ordinary carriage when there are no horses to kick up the dust?" One reason, and the

most important one, is that as a rule the exhaust outlet is placed in such a position and so near the ground that every discharge strikes the ground with considerable force, therefore raising up a little cloud of dust with every explosion. This, of course, can be modified either by putting a plate or other contrivance to prevent the exhaust gases from striking the ground; and it would be found that this would greatly increase comfort not only to the occupants of one's own car but to the unfortunate people one passes in tow of the slower but more certain (?) animal, the horse. With pneumatic tires it is impossible to prevent the raising of dust, owing to their resiliency. A good instance of this may be seen in the case of a steel-tired and a pneumatic-tired brougham both travelling along the same road at the same pace; one would scarcely believe the difference in the amount of dust raised unless one saw the same personally. It is this class of annoyance, trifling as it may seem to the motorist, which does so much in maintaining the prejudice which exists against the motor, and which every motor driver is called upon personally to try to reduce by showing due consideration to the comfort of others.

#### A Doctor on Motoring.

THE ancient town of Stratford-on-Avon at last boasts of a privately owned motor-carriage, supplied to a leading doctor by Messrs. Hewetson's district agent. The car is a three-speed Benz "Ideal." The doctor is very

much enamoured of his car, and, in the course of conversation, told me that he found much more enjoyment and much less fatigue in doing his daily country rounds than he used to experience with his horses and dog-cart. "I can," he says, "lean back comfortably in my seat and become quite rested. I can get over the ground and up all the hills—and there are some very stiff hills around Stratford—in half the time that a horse would take to do the same distance, and I feel at all times that I have no tired horse to consider, and that the machine is equal to any demand I may make upon it." There are one or two doctors in Warwickshire using cars, and they are all of much the same opinion and admit that they are reducing their expenses considerably by using motors. The gentleman above mentioned is a very well-known sportsman and a keen horseman, but for his work prefers a motor, so that he can reserve his horses solely for sporting purposes.

#### A Motor Launch.

WHILE mentioning Stratford-on-Avon it may be interesting to note that there is an original German Daimler launch running on the river. The engine is at least ten years old, and is of the old V type, which was

the original type used for carriages. There is the same type of starting and reversing gear, by means of a clutch, and bevel face wheels, which is now fitted in launches by the English Daimler Co. Although the boat has seen considerable service, on the Norfolk Broads amongst other places, she is still doing her work admirably, and can easily overhaul the various steam launches which are to be seen on the river. I had a trip on this launch last week, and was very pleased with the working of the engine, which as I said has stood her ten seasons' wear admirably. It must be remembered, of course, that the engine in a launch is not subject to the same strains as are set up on a car by the unevenness of a road, all of which, of course, is in the engine's favour. The launch is kept at the Swan's Nest Hotel, where, although not stocked for sale, the ever obliging manager, Mr. Rose, will supply auto-carists with petrol.

"VERAX."

On Saturday afternoon a man named Stainer, residing in Newsham Square, Sunderland, was knocked down by a motor-car at the corner of High Street and Bridge Street. His knee was injured.

## THE ESTABLISHING OF RURAL AND OTHER MOTOR-VEHICLE SERVICES.—II.

**B**ESIDES all these reasons there exists another and perhaps more important one. The leading feature of a motor-vehicle service should be its ability to carry out a specified duty within reasonable times—in fact, in such times that horse-drawn vehicles are unable to accomplish. If a vehicle is selected whose weight, unladen, is over two tons the law imposes such restrictions as to its speed, width of tire and other details that the vehicle is unable to carry out its duties in the same rapid and prompt manner that a lighter and more moderate-sized vehicle would be capable of doing. The aim in establishing motor-vehicle services should be to employ such vehicles as are just within the almost prohibitive restrictions of the law, and that are, at the same time, capable of carrying a paying load.

Having decided upon the type of vehicle, its seating capacity, etc., the next step is to secure the delivery of such vehicles from the manufacturers. Unfortunately, projectors of motor-vehicle services, as well as the members of the general public, are much too prone to think that motor-vehicles when ordered can be delivered at once, or that vehicles of the type selected can be had *on hire* from manufacturers. In regard to this latter, it may at once be remarked that manufacturers are, at the present time, so overflowing with orders for purchased vehicles that they can afford to give no time to the consideration of constructing vehicles for hiring out either for public service or to private users. Moreover, they cannot afford to sacrifice their capital in manufacturing cars which are, after all, solely to be used in financing the promoters of motor-vehicle services. If they could afford to do this they could afford to run these public services themselves and to take the profits accruing therefrom. A motor-vehicle service, if properly projected and managed, is a profitable undertaking, but manufacturers have sunk such vast sums in equipping their works and in carrying out experiments that they are unable, in the majority of cases, to undertake the additional capital liabilities arising from the establishing of such services. The undertaking being profitable, it follows that such a scheme must be provided with sufficient capital to enable it to be worked with credit and profit to the owners and convenience to the public, and this is best provided either by large independent companies or, preferably, by small local concerns having the confidence of that section of the public for whom the projectors desire to cater.

To secure delivery of vehicles from the manufacturers, therefore, the promoters of a public motor-vehicle service must have sufficient capital to firmly order the type or types of cars selected. The position must be such that they can obtain the best discount by reason of their paying cash, and can further bind the manufacturer down to a reasonable time for delivery by their ability to hold out a threat of taking their orders elsewhere unless they are well treated in this respect.

So soon as the vehicles are ordered, if not before this time, the promoters must secure suitable buildings for the housing, washing, and overhauling of the vehicles. Unfortunately, in some respects, motor-vehicles are such willing servants that the necessity of taking care of them is frequently overlooked. Indeed, this overtrust in motor-vehicles is one of the curses of the present expansion of their use. A motor-vehicle doing twice or three times the work of a horse-drawn carriage requires at least twice the amount of care and attention. To keep it "spick and span" it is necessary that on its return from a journey it should be thoroughly well cleaned so far as the body, wheels, and frame are concerned, and carefully sponged and rubbed dry with leather. So far as the mechanical parts of the car are concerned, these require even greater care. We have known instances of owners running vehicles for 4,000 miles and never even thinking of putting grease upon the chains. Such treatment as this will certainly not answer. The chains must be

examined each day, carefully cleaned and re-lubricated, their tension adjusted (if need be), the sprockets freed from all encumbrances, and care taken that everything is in good order. Gear boxes should be opened at least once a week, the gearing examined, and, if necessary, adjusted and tightened; whilst the box should be filled up again with grease and carefully closed for fresh work. The clutch and its shaft should be carefully examined and overhauled, whilst the jet, burners, carburettors, and lubricators should all receive careful overlooking every week. Each day the lubricating devices should be filled and tested, and (an even more important point) examination should be made to secure that the circulating pumps are working efficiently and are throwing the requisite amount of cooling water.

In regard to the speed gears, these, together with the differential gear, should receive the utmost attention possible. We have seen cars that have run for several thousands of miles, in which the speed gears are practically unworn; and we have seen other cars, equally well-made in every respect, in which the speed gears have been worn almost to a knife-edge after a run of 200 miles. This wear is principally due to faulty driving; some drivers will get the gear into position quietly, quickly, without strain, jar, or grinding, whilst others are so clumsy that they can never engage a pair of gear-wheels without setting one's teeth on edge in the operation, owing to the terrific grinding action set up. As a result some drivers can show the gear-wheels of their vehicles almost as perfect as when turned out from the factory, whilst others practically grind a set of gears away in a week. It will be seen from this, then, that not only is it necessary to pay careful attention to the gear, on which depends the quiet and safe running of the car, but that it is also necessary to employ properly qualified and skilful men to handle the cars on the road. If owners of cars would only recognise that a careless or incompetent driver can do twenty pounds' worth of damage to a car's gear in almost as few minutes, they would be much more careful as to the selection of those whom they entrust with the manipulation of their cars on the road.

It follows, if careful inspection and efficient controlling of the driver's treatment of the cars are to be secured, that capable and properly trained men must be employed to inspect and overhaul the vehicles. This also necessitates the provision of a properly equipped, though not necessarily extensively fitted, repair shop being provided. Spare parts should always be in stock, in order that replacements of faulty parts can be made at once without laying up the vehicle, and if frequent inspection be resorted to it will be found that the expense incurred by some of these replacements is fully compensated by the vehicle's ability to run on the road over longer periods without "docking" than would otherwise be the case.

These remarks are equally applicable in regard to brakes and steering gear. The links and levers of the latter will need frequent inspection, more especially in the case where the wear and strain is on connecting pins rather than on the levers or links themselves. Brakes are so essential to the safety of the car and its passengers that every possible examination and every necessary replacement should take place at frequent intervals. In fact, if the service is to be profitable the "stitch in time" policy must prevail; no carelessness must be permitted in regard to details, and inspection must be frequent and thorough.

There are proper and improper ways of doing such simple things as putting the burners of lamps out. If the proper way is followed the wicks will last twice as long, the lamps will burn better and with more regular heat, and consequently the engine itself will deliver a given power more regularly and consistently owing to the better heating of the ignition tubes. Promoters of motor-vehicle services would do well to pay attention to these by no means complete hints. They will find that the slight expenditure incurred in going over, tightening up, examination, and, if necessary, replacement, will be fully repaid by the longer life of the car and its greater reliability and freedom from mishap.

(To be continued.)

## Motor-Vehicles on Hire.

MOTOR COUPÉ CO.'S CLOSED CAR.—(See p. 230.)

MOTOR COUPÉ CO.'S OPEN CAR.—(See p. 230.)

## MOTOR-CARS ON HIRE.

ON the preceding page we illustrate two of the handsome vehicles which the Motor Coupé Company are now letting out on hire for private use in town or country for short or long periods. The cars are of the Daimler (Canstatt) type; the engine (4 h.p. nominal) being placed at the rear of the carriage, and motion communicated to the rear road wheels by means of internal gearing wheel and pinion. They are certainly the most luxuriously fitted vehicle yet let on hire, and the Company should have no difficulty in readily placing every vehicle in active work. They are capable of travelling very long distances, being provided with ample water supply and also *refroidisseurs*.

It is a leading feature of the Company's operations that those attending balls and theatres, etc., will be specially catered for. The tariff is a low one, and it is only fair to state that thoroughly competent drivers are employed. The charges quoted, for reference for others letting motor-vehicles, we reproduce:—First two hours 10s., each hour after 4s. 6d.; dinner or theatre (single), 7s. 6d.; to and from theatre, 15s.; balls or receptions or opera, £1; one day not exceeding nine hours, £2 2s.; one week of six days (hired to pay for all oil used), £7 7s.; Saturday afternoon to Monday morning, £4 4s.

## THE GROUVELLE-ARQUEMBOURG WATER-COOLING TUBES.

A WATER-COOLING device or condenser which is now being very largely used by builders of petroleum spirit motor-carriages in France is that made by Messrs. Grouvelle & Arquembourg, Ingénieurs-Construc-teurs, of 71 Rue du Moulin-Vert, Paris (XIV. Arron-

can be either of iron or aluminium, as desired (the latter affording the advantages of lightness, and the feature that mud does not adhere to them), measure 40 mm. by 40 mm. in the smaller size and 50 mm. by 50 mm. in the large size. The weight of the serpentine is: small size, with iron radiating plates, 2.8 lb. per metre; ditto with aluminium plates, 1 lb. 14 oz.; large size, with iron plates, 4 lb.; ditto with aluminium plates, 2 lb. 11 oz. The makers claim that by means of their water-cooling apparatus it is possible for a petroleum motor-car to be driven a distance of 200 kilometres at an average speed of 20 kilometres (12½ miles) per hour without it being necessary to take in a fresh supply of cooling water.

DR. VON STERN, the representative of the Austrian Touring Club at the International Cycling Congress last week, is stated to have travelled the whole of the way, with the exception of the crossing of the Channel, from Vienna to London in a motor-car.

AT Leamington recently Josiah W. Thompson, of the Star Motor Works, Wolverhampton, was ordered to pay 30s. to William James Allen, coach-builder, 1 Regent Grove, Leamington, for quitting his service without notice. Complainant said he was entitled to a week's notice. Defendant, on the other hand, said he was engaged by the hour, and that an hour's notice was the custom of the trade.

MESSRS. H. A. CLARKE & Co., of 31 Rutland Street, Leicester, inform us that they are now stocking Pratt's motor spirit, and that, being the engineers to the Leicester Motor-Car Co., Ltd., they are in a position to execute any repairs required by tourists passing through Leicester. Messrs. Clarke & Co. are also sole agents in Leicester and district for the Daimler Motor Co., Ltd., and keep a number of necessary parts in stock.

FIG. 1.

FIG. 2.

dissement), and of which illustrations, Figs. 1 and 2, are given herewith. It consists of a serpentine of copper tubes to the exterior of which are affixed *ailettes* or radial plates of iron or aluminium. Although not necessarily restricted to a serpentine, that form as shown by Fig. 1 is generally adopted, the distance between the centres of the pipes in the serpentine being either 60 mm. or 80 mm., according to the diameter of the pipes. In order that the air shall be free to circulate over the cooling plates of the serpentine, the latter is generally attached to the front portion of the frame of the car below the "body," its position in the water circulation being usually between the water-tank and the circulating pump, the heated water thus passing in at the top of the serpentine, and the cooled water emerging at the bottom. The device is made with pipes of two sizes—for motors indicating up to 8 h.p., pipes 15 mm. internal diameter are employed, the length of the serpentine required being 2 metres per h.p. of the motor; for motors above 8 h.p. a serpentine with pipes 18 mm. diameter is made and recommended, the length per horse power being only 1.35 metres. The radiating plates, which

A COMPANY has just been formed in Paris (7 Rue Brunel) with a capital of £20,000, and with the title *La Société des Voiturettes L'Créanche*, to manufacture and deal in motor-cycles and motor-cars, etc.

ON Saturday Mr. Clarke held an inquest at Shrewsbury on the body of Thomas Williams, drayman, who died in the infirmary from injuries received on May 2nd. The horse which the deceased was driving was startled by a motor-car driven by Mr. E. Robbins, of Moseley, Birmingham, and in trying to stop the animal deceased fell under the wheels of his van. A verdict of accidental death was returned.

FIVE motor-cars are now running regularly at Sunderland—to the west end of the town and to Roker—and two others are kept in reserve in case of breakdowns. Further cars are being built for the Wearside borough at Coventry, and by the Otto Motor-Car Company, London; and when the orders now on hand are executed there will be about twenty of the self-driven vehicles on the present and on new routes. It is intended, in the course of a few days, to open a service between Sunderland and Grangetown.

## The Automobile Club's Trials.

"STAR AND GARTER" YARD, RICHMOND.

THE first of the trials held in connection with the above Club duly commenced in glorious weather on Richmond's beautiful heights on Friday last, and although there was practically no attendance of the public, there was a fair muster of something like thirty motor-cars. The start was somewhat slow—in fact, rather behind the announced time; but this no doubt was owing to the fact that every passenger had to be weighed, the petrol tested, and the

however, midday when the first car got away, and the proceedings afterwards seemed somewhat slow; but the trials were satisfactory, inasmuch as nearly every vehicle succeeded in performing the tests appointed.

The apathy of the public seemed rather astonishing to us, also the lack of interest taken by members of the Club in the trials; for at no time during the day was there on the hill more than forty people, and in this number we include the officials, etc. Besides the cars actually taking part in the

JUDGES AND OBSERVERS, PETERSHAM HILL.

electricity noted, etc. There were a multitude of officials, and no doubt their presence will give something in the nature of perfection to the results arrived at. The earliest car arrived at the "Star and Garter" yard about 9 o'clock, and thereafter the cars came up in quick succession until, about 11 o'clock, every vehicle had arrived. It was,

DE LA HAYE CAR, PETERSHAM HILL.

competitions, there were present Sir David Salomon's Peugeot, Mr. Hargreave's "twin" Daimler, and Mr. Roger Fuller's De Dion tricycle.

The instructions to competitors in the hill-climbing trials were that each competitor had to assemble in the yard of the "Star and Garter," not later than 10 a.m., then get weighed

along with the passengers, and afterwards proceed in the car down Petersham Hill. At the "Dysart Arms," at the foot of the hill, the competitor had to ride up the hill again at his

PETERSHAM HILL.

best speed for time purposes, then turn and come down hill at good speed for the purpose of car being stopped suddenly, by whistle, to test brake power. Reaching the foot of the hill, the competitor once more turned, and rode forward with a view of being stopped at the steepest part, within about thirty feet of the summit, to test the speed of the starting of the car. At this point several failed, in more than one instance the motor stopping; but we think the value of the test of the brake power was neutralized to a great extent by some of the competitors proceeding down hill very cautiously, not to say warily, evidently having had the "tip" to watch for the man with the whistle in his mouth.

1.—BARRIÈRE TRICYCLE.—Ridden by patentee. Sprinted up the hill in fine style; stop and start also good.

23.—INTERNATIONAL CAR.—4½-h.p. English-made car. Went up hill first time well, travelled down slowly, and failed at the re-starting.

LANCHESTER CAR, PETERSHAM HILL.

16.—CANSTATT DAIMLER.—Driven by Mr. Hankinson. Three passengers. Failed at the re-start, passengers having to dismount.

22.—BENZ NO. 1 IDEAL.—Driven by Mr. Campbell. Performed all the tests well.

20.—NEW SMALL DAIMLER.—Driven by Mr. Critchley. Three on, the extra passenger sitting on the "bonnet." Did very well, and caused general admiration at its cob-like appearance.

34.—HERCULES (DUCROISSET) WAGONETTE.—Driven by Mr. S. Atkins. Three passengers. Went up hill splendidly; but in our opinion, through brake lever being too short and out of reach of driver, the "pull up" was slow. The re-start was very good. A second trial with "six up" was also successful.

31.—VALLÉE.—Had two trials; in both instances slow at stopping through difficulty of reaching brake handles.

14.—RIKER ELECTRIC CAR.—Seat one, beside driver. Built by Messrs. Mackenzie & Co. Performed the tests beautifully, its silent running causing general admiration.

36.—TOURIST.—French car, on Bollée principle.

32.—MORS.—Driven by Dr. Lehwiss. Went up hill first time very well, and also travelled down hill fast, but did not stop at sound of whistle. At the dead stop, car failed to start for some time.

35.—ORIENT EXPRESS.—Driven by Mr. Frentzel, Mr. Buttemer passenger. Performed the tests creditably, travelling up the hill at fair speed and pulling up under fifty feet.

10.—ELECTRIC FOUR-WHEELED BUGGY.—Built by Electrical Undertakings, Ltd. Two passengers. Fastest

MORS CAR, PETERSHAM HILL.

car of all up hill—so fast, indeed, that for confirmation sake driver was asked to do second trial. Reputed to have performed the journey up the rise twenty seconds faster than any other car.

19.—DAIMLER WAGONETTE.—Driven by Mr. Van Toll, with five heavy passengers, weighing in all 79 st. 9 lb. The car reached the top first time all right, and in descending came down the hill at a great rate. When the whistle was sounded, the brake was put hard on, skidding the wheels and cutting up the roads. The strain, we should imagine, was about the greatest that could be applied to a vehicle.

PETERSHAM HILL.

The car was brought to a standstill within fifty feet. On the return journey, after the stoppage, there was a great struggle to get a start, but ultimately the car reached the top, without any of the passengers dismounting.

18.—DAIMLER SIAMESE CAR.—Driven by Mr. Mayer. Three passengers. Went up and down the hill; stopped and started, and drew up within fifty feet.

21.—8-H.P. BENZ DOG-CART.—Driven by Mr. Coles. Three passengers. Rather slow up the rise, but in the

AN INN YARD.

descent a cart was in the way and the whistle was not heard. A second trial was allowed, and a phenomenally sharp stop was made. The stop and start on the hill was very satisfactory.

24.—LANCHESTER 10 H.P.—Driven by owner. One passenger. Went up hill at very fair speed, but not as fast as we anticipated, considering the power of the motor. Came flying down hill, and brake, being sharply applied, caused car to swerve. Took nearly 150 feet to draw up. The starting test was very satisfactory.

BAYLEY'S CAR, UXBRIDGE.

26.—DE LA HAYE.—A four seated vehicle, shown for the first time in this country. Driven by a Frenchman, and with Mr. Heyermans and two passengers on board. Travelled up hill very well, but came down slowly. Performed other test satisfactorily.

29.—8-H.P. PANHARD.—Driven by the Hon. C. S. Rolls, accompanied by a passenger. Travelled up the hill very well, but not fast. Slowed up leisurely, no doubt out of respect for car.

27.—IVEAGH PHÆTON.—Five seated. Went up first time all right, but passengers had to dismount at final test.

30.—SMALL BENZ.—Mr. Beevor. Driven by owner, who travelled well down the hill to starting point; then went round the base of the hill back to the yard.

Mr. Butler's (No. 28) car also refused to face the rise.

25.—HURTU.—Driven by Mr. Rush. Failed at the stopping and starting test.

Regarding Saturday's trials, only two electrical vehicles started, and particulars of results will be found in another column.

Referring to the fifty-mile trials, speed was, of course, limited to the Board of Trade regulations of twelve miles per hour. Twenty-two vehicles took part in the contest, and the drivers and passengers on these had a very miserable time. The day was a beautiful one, and most of the cars went through without stopping for adjustment, but many were pulled up by the observers for exceeding the limit of five minutes per mile. The average was found most difficult to maintain, and several cars had to loiter by the milestones until the necessary seconds—in more than one instance, minutes—had passed. The whole affair was weary, and to see Mr. Lanchester's car, the 8-h.p. Benz, the du Croiset, and the

INTERESTED SPECTATORS.

fast "Mors," along with the "hippopotami" on wheels, crawling along was an object deserving of reproduction by photographic process, but unfortunately the episodes are lost.

Some twenty-two cars took part in the function, and all but two or three came through satisfactorily. The "Mors," however, punctured a tire and slipped a belt. At the Great Dashwood Hill most of the cars "got up," and very creditably, too, but the Barrière tricycle was stopped for exceeding the limit of twelve miles an hour on the hill, and the patentee had to walk up, much to his disgust. Mr. Crompton, jun., the cyclist observer, probably enjoyed the rest. One of the cars, the new light Daimler, very fast speeded, driven by Mr. Critchley himself, got half way up the hill, but the car being absolutely a new one, and without a third speed, would not mount, and rather than push it up

SOUTHALL.

the driver turned round and did some of his miles on the return journey well within the "legal" limit.

On Tuesday another of the announced trials took place. We unfortunately, through a breakdown on the Metropolitan

Railway, missed our train, and did not reach the Chequer's Inn, at Uxbridge, till nearly 12 o'clock. Outside was, to us, a new vehicle; it was labelled E. H. Bayley's van, but on examination we found the engineers' work was by Owen Brazil & Holborrow, engineers, Bristol. It was of lorry style, and had a De Dion boiler, Straker's compound engine, and the under gear seemed to us a very good facsimile of the Daimler gear.

There was considerable delay in the starting of this vehicle, and when apparently ready for going it was found that the car had to be weighed. Coal and coke then had to be removed from the vehicle, and it was past one o'clock before a start was made. We had missed the other vehicles, but after luncheon, in a car driven by Mr. Sturme, we had the opportunity of journeying over the course of twenty miles which the heavy vehicles had to travel.

The first vehicle we passed was Bayley's, travelling remarkably well with its load of three tons. Afterwards we passed the Daimler post office van, carrying thirty cwt. This car was travelling very finely, and immediately behind, within fifty or sixty yards, was the Thornycroft, using Welsh coal, and carrying three tons. The other two vehicles were Canstatt Daimlers, owned by the Motor Supply Company, and carrying respectively three and five tons. All the cars came within, we are informed, the legal allowed time, but more than one had to slow up at the milestones through being too fast.

An incident during the journey of twenty miles was the passing by the Thornycroft of the Daimler, which was religiously kept within the time limit by Mr. Critchley, who was driving. But the Daimler had its revenge afterwards when the Thornycroft vehicle stopped to obtain water, and thereafter the latter vehicle was content to follow within forty or fifty yards of the Daimler the remainder of the journey.

The drivers and passengers were not only white from the extreme dust but were also sore from the hardness of the seats which they occupied, nails and stones not being conducive to comfort.

## THE HILL-CLIMBING CONTEST.

THE hill-climbing contest of the Automobile Club took place on Friday last at Petersham Hill. The length of the hill is 817 feet, and the total rise 73 feet, the average gradient being 1 in 11.19. The following table gives the details of the result as compiled by the Club's officials:—

| Official No. | Stopped in Feet. | At a Speed of Miles per Hour. | On a Gradient of | Ascended Hill at a Speed of Miles per Hour. | Name of Entrant.                | Class of Vehicle.       |
|--------------|------------------|-------------------------------|------------------|---|---------------------------------|-------------------------|
| 1            | 86               | 14.62                         | 1 in 13.85       | 13.926                                      | Automobile Association, Ltd.    | Barrière Tricycle       |
| 10           | 90               | —                             | 1 .. 13.85       | 10.965                                      | Electrical Undertakings, Ltd.   | 4-wheel Buggy           |
| 14           | 98               | 15.47                         | 1 .. 12.9        | 5.719                                       | Mackenzie's Carriage Co., Ltd.  | Hooded Phaeton          |
| 16           | 96.75            | 14.88                         | 1 .. 12.9        | 4.00  | Motor-Carriage Supply Co., Ltd. | Convertible Wagonette   |
| 18           | 47               | 15.43                         | 1 .. 12.9        | 5.35  | Daimler Motor Co., Ltd.         | Siamese Phaeton         |
| 19           | 48               | 14.65                         | 1 .. 12.9        | 4.41  | Daimler Motor Co., Ltd.         | Rougemont Wagonette     |

In this contest the Automobile Association also entered but owing to some informality in the entry—a point to be finally decided by the judges—the details of their vehicles were not included in the official list up to Wednesday evening. The speed at which their vehicles ascended the hill was, however, as follows:—

| Class of Vehicle.            | Miles per Hour. |
|------------------------------|-----------------|
| Vallée ... ..                | 7.8             |
| Hercules ... ..              | 6.11            |
| Orient Express ... ..        | 5.17            |
| Tourist (three-wheel) ... .. | 4.95            |

At the time of going to press we learn that the above entries have been officially accepted.

## LONG DISTANCE TRIALS FOR ELECTRIC VEHICLES.

THIS contest was decided over a course commencing at Richmond and going through Kingston, Esher, Leatherhead, Epsom, Ewell, and back to Richmond. There were two competitors, the Electrical Undertakings, Ltd., entering a four-wheel buggy, and the Mackenzie Carriage Co. a hooded phaeton. The former weighed 16 cwt. 2 qr. 16 lb. unloaded and 19 cwt. 2 qr. with two passengers, and covered a distance of 33½ miles in 3 hr. 14 min., the average speed being 10.36 miles per hour. A moment's delay through a horse being in the way and the fact that a wrong turning was taken on two occasions were among the incidents of the journey, the others being the stoppage for a few minutes because of hot bearings at the twelfth mile, and for three minutes at Epsom. Never did the car exceed a speed of twelve miles an hour, and there was a marked absence of noise and vibration.

The Mackenzie Carriage Co.'s entry weighed 18 cwt. 3 qr. 10 lb. unloaded, and 21 cwt. 2 qr. with two passengers. In 3 h. 50 m. it covered twenty-nine miles at an average speed of 7.56 miles per hour. Three stoppages were made ere the charge finally run out, causing the stoppage of the car altogether. One was occasioned by the traffic, and at the twenty-fifth mile four minutes were spent in pushing the car fifteen yards to the top of the hill. Later, a quarter of an hour's rest was given the cells, which had nearly run down, and then came the end.

## LONG DISTANCE CONTEST.

TWENTY vehicles took part in the fifty-mile petrol contest of the Automobile Club. Commencing at Southall, the course was twenty-five miles along the Oxford road and back again. In the table on page 235, giving full official details of the results, the abbreviations m.s. indicate milestones, these being counted from London.

The Motor-Carriage Supply Co.'s wagonette (No. 16) weighed 27½ cwt. and only required 2½ oz. of water during the journey. At the twenty-fifth milestone the first stoppage was made, and again on Stokenchurch Hill it was necessary to attend to the friction clutch. It kept a uniform speed throughout the contest.

The Daimler Co.'s Siamese phaeton (No. 18) went through the contest without a stoppage at an average speed of 12.29 miles per hour, with a water consumption of 1½ gallons, but most of the other cars had delays for various causes. One of the Critchley light cars (No. 17) turned back between the thirty-third and thirty-fourth milestones, but the other car of that type (No. 20) went the whole 50 miles in 4 h. 25 m., only stopping twice, once for half a minute at the hill near the ninth mile and again at the tenth to make some minor adjustments. Its consumption of water was 2 gallons 1 pint. The same Company's Rougemont wagonette (No. 19), weighing 27½ cwts., was stopped at the twenty-fourth milestone for two minutes, the burner requiring relighting; but no

| 36           | " .. ..                            | 10 47          | 57 0                        | 5 20                          | 6 55                          | 8 30                          | 5 0                           | 4 46 0      | 10'49                 | '26                          |

person left the car, and an average speed of 11'62 miles was attained, one gallon of water being required. Neither the Benz dog-cart (No. 21) nor the Benz Ideal (No. 22) made a single stoppage, doing the journey at average speeds of 12'29 and 12'19 miles per hour respectively, the water consumption being 2 gallons 5 pints in the case of the former, and 1 gallon 5 pints in the case of the latter.

No. 23, a four-wheel "International," weighing 11½ cwt. (42 lb. short), had a series of misadventures, and although the speed when running reached fifteen miles per hour the rate for the journey only averaged 8'26 miles per hour. At Wycombe two gallons of water had to be obtained, and then a stoppage was necessary at the seventeenth milestone owing to faulty ignition. The same cause delayed the car twelve minutes four miles further on, and then at the twenty-second mile twenty-three minutes were occupied in adjusting the exhaust opening. Various other stoppages were made to refill the tanks during the next few miles; and then at the thirty-third milestone loosened crank bearings necessitated a delay of seven minutes, while three minutes were occupied in making the ignition certain, and a similar time to clean the cylinder lubricators. The tap being left open caused a leakage of water from the tanks, which became apparent later, and six minutes were occupied in refilling, the total consumption of water on the journey being 6 gallons 4 pints. Mr. Lanchester's three-seated car (No. 24) used no water, and was slowed down before each milestone in order to keep within the twelve-mile limit. The four-wheel phaeton (No. 26), which attained an average speed of 14'77 miles per hour, was stopped two seconds on account of the traffic; otherwise it had a straight run, with a water consumption of 1 gallon 1 pint. No. 27, a five-seated Phoenix, made a uniformly fast pace, and the only difficulty was that the burner required re-lighting on three occasions. It weighed 1 ton 8½ cwt., and consumed 6 gallons 7 pints of water. The Hon. C. S. Rolls went through on his Panhard without stopping, the speed being uniform, and only 4 pints of water being required. This car weighed 20½ cwt. Two stoppages were made by the four-wheel car of Messrs. Marshall & Co., the first at the fifteenth mile to see to the ignition, and again at the hill near the twenty-second milestone owing to a wrong mixture. The car had to be helped up Stokenchurch Hill, and on the return journey the vibration was very noticeable, and on three occasions the driver had to get off. Ultimately it stopped, and oil had to be borrowed to assist the final attempt to get home. The average speed when running was twelve miles per hour, but this was materially reduced so far as the

average rate of progress over the whole distance was concerned. Mishaps attended Mr. Butler's two-seat Benz car (No. 28) from the eighteenth mile, and at the twentieth it stopped for repairs at a blacksmith's shop. At the twenty-sixth mile it was delayed three and a quarter hours for a new cotter and pin.

Several vehicles were entered by the Automobile Association, Limited. Their Vallée car (No. 31), weighing 13 cwt., had a minute's stoppage to adjust a detail, and at the thirty-third milestone was delayed four minutes while the ignition was being attended to. This again gave trouble later, and on reaching the twenty-seventh milestone a stoppage of nine minutes was made to allow the bearings to cool. When running the car was uniformly too fast. Fairly uniform results were attained by the Mors car (No. 32). At Wycombe a stoppage was made on account of a puncture, and there a gallon of water was taken. The slipping of a belt on the brow of a hill occasioned a further stoppage, and later the friendly act of giving petrol to another car caused a slight delay. Several stoppages were made by the Lynx car (No. 33), the speed of which was uniformly too fast when running. At the fourteenth milestone the tire required pumping, and water was again required at the twenty-third mile. Changing the gear four miles further on caused another wait of nine minutes, and later four minutes were occupied in taking in water. Three short stoppages on the way back were also made. The Hercules car (No. 34) had an experience with frightened horses, resulting in a collision, and consequent delay of two minutes one minute having previously been lost on Stokenchurch Hill. Another of the Automobile Association's vehicles, the Orient Express (No. 35), also stopped on this hill, the lubricator having become blocked. This again caused a delay at the thirty-second milestone, while on the return journey several stoppages, one of twenty-six minutes at the sixteenth milestone, were necessary. The Tourist car (No. 36), weighing 7¾ cwt., had two stoppages, the first (at the twenty-third milestone) being to lubricate the crank chamber, and the second at Wycombe for the refreshment of the driver, and oil for the crank joint.

## HEAVY TRIALS.

THE trials for heavy vehicles were run from Uxbridge, the distance being ten miles, and back again, making a course of twenty miles. In studying the official details on next page, it should be remembered that the time occupied

| Including stops.<br>4'81<br>when steaming. |                            |               |      |     |                 |      |     |             |           |                |                     |                  |                    |       |    |                       |      |        |

in turning really represents a run of two miles in addition to the turn, as the time was taken from the moment the car commenced to travel a certain mile and, having turned, got back to the starting point. The longer time occupied by Messrs. Bayley's van was due to a misadventure in getting into the ditch, and hence two average speeds are given, one including stoppages and the other only taking account of the progress when steam was up. The two vans of the Motor Carriage Supply Co. (Nos. 42 and 43) were 10 and 6 h.p. respectively, and that of the Daimler Co. was one designed for post office service.

## SPEED TRIAL.

THE speed trial fixed for Wednesday only attracted one entrant—the Delahaye Co.'s four-wheeled phaeton. A course was selected outside Colchester, and in the local arrangements for judges, as well as competitor, Mr. Stokes took considerable interest, materially assisting the convenience of all concerned. In the result the phaeton covered the mile in 2 m. 13½ s.

## SCOTTISH NOTES.

### The Motor-Car's Growing Popularity.

THIS week I observed a striking illustration of the growing interest in the motor-car among a class of people who have, undoubtedly, a strong bias in favour of the "noble horse." The "Queen's Own" Yeomanry Cavalry (Lanarkshire) have, during the past ten days, been undergoing their annual drill at Hamilton, and the ancient town has for the time worn a more than usual military aspect, and has been altogether more animated. During their visit it appears that the "gallant knights" in large numbers have sampled the delights of motoring for the first time, and I learn that on all hands the motor-car has conquered. One gentleman who is a capable horseman and has driven and ridden much, assured me that the runs which he had been able to secure on the Hamilton motor-cars had vastly astonished him, the idea of real enjoyment in driving a mechanical vehicle being apparently quite new to him. He expressed himself surprised at the smoothness and regularity in the motion of the cars, the sense of comfort and genuine pleasure he so unexpectedly experienced—so much so, that he had decided to purchase a car for himself. During the whole week the cars of the local company were in great demand, and quite a crowd of them were in attendance at the annual sports and races in connection with the "Queen's Own" on Saturday last, alongside the usual turn out of horse-drawn landaus, wagonettes, etc., etc.

### Motors and Marriages.

JUST as it was the proper thing for the Hamilton motor-car makers to employ only mechanical vehicles on the occasion of their excursion a week or two ago, it was in the natural fitness of things that motor-carriages should be in evidence last week on the occasion of the marriage of

Miss Stirling, sister to Mr. John Stirling, of Hamilton. In the afternoon the wedding party were taken out on some half-dozen motor-cars of various types. The use of mechanical carriages at Scotch weddings is not at all uncommon, and appears to be appreciated by the guests.

### Edinburgh to London.

ON the eve of sending my "notes" to the press, Mr. Stirling advises me that he left Edinburgh this (Wednesday) morning on his Stirling-Daimler dog-cart to run up to London. He has selected the East Coast route for a change, and expects to get somewhere near York (203 miles) before "drawing bridle."

### Another Edinburgh Car.

THIS week another elegant Stirling-Daimler car has been added to the stud of the Edinburgh Autocar Co., Ltd. It is described by the makers as a "sociable-wagonette." In place of the entrance being by a door at the back, as in the case of the ordinary wagonette, access is had by the front, the usual front seat being divided in the middle for this purpose. It appears to be somewhat after the style of Mr. Sturmeys "John-o'-Groater," only of larger capacity. This form of carriage is certainly comfortable, and the view ahead is uninterrupted by the box seat.

### The Shows.

I UNDERSTAND that that enthusiastic motorist, Mr. P. Drummond, of Stirling, is riding up to the Richmond Show on his De Dion tricycle this week, and everybody else who can are finding their way South to take part in the Exhibition functions.

### A Favourite Scottish Route.

STARTING with the City of Glasgow as a centre from which to work, one of the most charming runs for the "touring" motorist is to take the Dumbarton Road out of Glasgow, and following the Clyde for several miles run down through Dumbarton (noting by the way Dumbarton Castle) and Alexandria to the shores of Loch Lomond—the Queen of our Scottish lakes. The road all the way is excellent, and the scenery the most varied and delightful to be found in the country. For miles the road winds along the shores of the Loch, at every turn bringing new and exquisite views of "mountain and flood." At Tarbet, about half way up the Loch, is a first-class hotel where both the wants of man and motor-car can be supplied. To thoroughly enjoy this trip speed should not be attempted, especially as there are many awkward right-angle turns to be negotiated, requiring considerable care, and Tarbet may be made a suitable stopping place for the night.

"BROWN HEATHER."

It is announced that the construction of motor-cycles is being taken up by the Veldidena Cycle Works at Junsbruck, Austria.

## A DOCTOR'S CAR.

**T**HE Yorkshire Motor Company of Bradford have designed the Jackson doctor's car to meet what they consider are the essential requirements of those who are looking to the motor-car either to save money or time, or to be a source of pleasure and health.

This carriage is a four-wheeled one, running on strong tangent wheels, which, it is stated, will withstand both vertical and side strains. They are fitted with 3-in. pneumatic tires of such design as will be almost unpuncturable, and will reduce the vibratory wear and tear of the car to a minimum.

The frame is of channel steel which makes the lightest and at the same time the strongest frame known.

YORKSHIRE MOTOR CAR CO.'S "DOCTOR'S CAR."

The body is hung on laminated steel springs, so that in combination with pneumatic tires a most comfortable car is obtained. The body of the carriage can be of any design; either back-to-back dog-cart, vis-a-vis phaeton, Stanhope phaeton, small coupé, or tradesman's van; but all are of the same uniform excellent workmanship, and finished and upholstered in the best style, and are interchangeable, so that, with two bodies, at a slight extra cost a summer and winter vehicle can be obtained, or a car for light goods delivery (up to 5 cwt.) or pleasure.

The motor is in the front, thoroughly cased in and protected, and is on the De Dion principle, with balance and fly-wheels running in an oil case and very silent in working, the exhaust being carried low down under the car and being quite free from smell or vapour. The Narling gear is a notable point, being affected from the driver's seat, so that there is no need to let the motor continue running when the car is standing, a turn of a handle being sufficient to again set it working. There are three speed gears, the makers using belts actuated by jockey pulleys, whereby the exact tension necessary for driving can be obtained by the position of the hand lever.

The cars can either be driven to each hind wheel from the counter shaft which contains the balance gear for two light roller chains, or can be fitted to drive centrally on a driving

axle fitted with balance gear by means of a pinion and sprocket wheel for the counter-shaft.

There are two band brakes on the driving wheel hubs, as well as tire brakes, on each driving wheel—and also the braking action of the belts can be used to stop the car.

An endeavour has been made to use ball bearings in every part in order to minimise friction and to enable easy adjustment, and all the wheels, steering gear, counter shaft and intermediate shaft, and even the jockey pulleys, are run on well-designed ball bearings. The steering and driving handles have all been placed in the most convenient positions, the former, a wheel at the driver's left hand close against the seat edge, the latter at his right, also against the seat edge, so that in wet weather his hands can be entirely under cover of the apron, and not stretched out in front. The manipulation of the car in traffic, by means of the foot-brake and the ignition switch, makes it absolutely under control.

A leading feature of the Jackson doctor's car is that by undoing a few bolts the entire body of the car can be lifted off in a few minutes and another one substituted, so making the car suitable either for business or pleasure purposes, or it can be supplied with an open and a closed body, so that in bad weather or at night a closed carriage may be used, while by day or in summer the car has all the advantages of an open carriage. This makes the one car equal to two separate carriages at a small extra cost.

Coach-building and motor-car making are two entirely distinct professions, and yet so many coach-builders are naturally anxious to be connected with the newer industry. Now, the Yorkshire Motor Co. are motor builders and by supplying the frame, wheels, motor and gearing complete in running order they hope to work with the coach-building trade. They therefore intend to make a special feature of supplying the coach-builders with that part which is their special department, and hope to have a leading carriage-builder in each town as their agent ere long.

THE title of La Société d'Automobilisme et de Cyclisme, of 32 Rue Caumartin, Paris, has been changed to La Société d'Automobilisme (Société d'Etudes).

THE young man, Diamond, who was so seriously injured in the motor-car accident at Alnwick last week, is now progressing satisfactorily, and is out of danger, although it will necessarily be some weeks before he has the use of his limbs.

WE are informed that Mr. F. W. Heaton, of Heaton, Smith & Co., electrical engineers, of Sidney Street, Salford, Manchester, is open to buy three motor-cars. Manufacturers please note, especially those making electric or steam vehicles.

HENRY JAMES WIMSHURST, of Coventry, held his first meeting as a bankrupt on Friday in last week. He had been experimenting with a motor, and had got a patent, but these experiments, it would seem, were the chief cause of bankruptcy.

MESSRS. HOWARTH & Co., of Bradford, builders of steam motor-vehicles, have removed to more commodious premises at 178 Garnett Street, Leeds Road. Automobilists who may be visiting the district should make a note of the address so that in case of need they may visit Messrs. Howarth.

ON Thursday week last the case, Leach v. Hewetson's Ltd., came on for hearing at the Westminster County Court, the plaintiff claiming £50 damages for injuries alleged to have been caused through collision with defendant's motor-car. Counsel were engaged on both sides, counsel for Messrs. Hewetson being instructed by their solicitor, Mr. Woodhouse, of the firm of Stanley, Woodhouse and Hedderwick, Ludgate Hill. After a hearing lasting from 2.30 to 5 o'clock, the jury returned a verdict to the effect that the plaintiff had not made out his case.

## NEW BELGIAN TYPES OF LIGHT MOTOR-CARS.

—88—

**I**N our issue of April 7th last we mentioned that a new two-seated light motor-carriage had been put on the market by the Fabrique Nationale d'Armes de Guerre, of Herstal, near Liège. We are now able to publish two general views (Figs. 1 and 2) of this elegant little car, together with a few additional particulars. As will be seen, the motor is located in the front position of the car, so as to be readily accessible. It is of the vertical petroleum-spirit type; it comprises two cylinders set side by side, and is stated to be capable of

around the cylinders, these, combined with the location of the motor in the front of the vehicle, rendering the use of a water-jacket unnecessary. The ignition is electrical, an induced spark effecting the ignition of the explosive charge. Passing to the transmission mechanism, from the motor shaft to the intermediary shaft the power is transmitted by belts, and from the intermediary to the rear road-wheel axle by means of the usual chains and sprocket wheels. Two mechanical forward speeds are provided, the variable speed gear being controlled by a single handle mounted on the steering standard. It is claimed that, by means of the variable speed gear and the variation of the electrical ignition, any speed from zero up to 35 kilometres per hour can be obtained. The road wheels are of the cycle type, fitted with pneumatic tires. Steering is effected by the front wheels, which are fixed on the usual short vertical pivots. The steering hand-wheel and the speed-control handle are mounted on a standard in con-

FIG. 1.—GENERAL VIEW OF THE FABRIQUE NATIONALE'S NEW CAR.

FIG. 2.—FRONT VIEW OF THE FABRIQUE NATIONALE'S NEW CAR.

working up to 3 h.p.; while its weight is given as 55 kilogrammes, or just over 1 cwt. Radial discs are provided

venient reach of the motor, provision being also made for the starting of the motor from the driver's seat. The petroleum-spirit storage tank has a capacity of 25 litres. The carriage complete weighs from 4 to 5 cwt., according to the class of carriage-builder's work desired. The car has only been on the market for about a couple of months, but orders have come in so rapidly that the Fabrique Nationale inform us they cannot book any more orders for delivery this year. The price of the car is, we understand, 3,000 francs, or about £140.

Fig. 3 gives an illustration of another new light motor-carriage which has lately been put on the market by the Société des Ateliers Vivinus, of 244 Rue du Progrès. The motor is of the vertical petroleum-spirit type, and is arranged in the front portion of the vehicle; it is stated to be capable of indicating up to 3½ h.p. The ignition is electrical, while for cooling purposes the cylinder is provided with radial ribs; these, combined with the location of the motor in the front portion of the

FIG. 3.—GENERAL VIEW OF THE "VIVINUS" CAR.

car, rendering, it is claimed, the use of a water-jacket unnecessary.

As regards the power transmission gear, two speeds are provided, the transmission from the motor shaft to the intermediary being by means of a single belt and two pairs of pulleys. The belt normally runs slack, and when shipped on to one or other pair of pulleys is tightened and consequently made to grip by means of a jockey pulley controlled by a foot pedal within convenient reach of the driver's foot. From the intermediary shaft to the rear road-wheel axle the power is transmitted through spur wheels, the one on the rear axle surrounding the differential gear, the ordinary driving chains and sprocket wheels being thus dispensed with. Although only two mechanical speeds are provided, any intermediary speed can be obtained by advancing or retarding the electric ignition. A petroleum-spirit storage tank is provided of a capacity sufficient for a run of about ninety miles. The road wheels are of the suspension type fitted with pneumatic tires. Steering is effected by the front wheels from the steering standard in the usual way. The weight of the "Vivinus" car complete is stated to be just under 3 cwt. Although it has only been on the market a very short time, we learn that the makers have already close upon 150 cars on order, this no doubt being owing, to some extent, to its relative low price—£120.

## CORRESPONDENCE.

### 1899 TRIALS OF MOTOR-VEHICLES FOR HEAVY TRAFFIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am not in a position to furnish you with a list of the entries, as there are several which may be excluded by the judges, who have not yet met to consider them. It is also possible that further entries may arrive from America, since I have been in correspondence with several firms there, to whom, in consideration of the time occupied by corresponding, I have allowed a little grace.

I am pleased, however, to be able to assure you that we shall have a larger number of vehicles taking part this year than last, probably not less than eight, of which two or more will carry loads of five tons and upwards.

As regards the arrangements for the trials, at present I can give you the following outline:—

Friday, July 28th.—Vehicles arrive at the show-yard of the Royal Lancashire Agricultural Society, Wavertree Recreation Ground, Smithdown Road, Liverpool. Inspection by the judges at 3 p.m., and preliminary records by the observers.

Saturday, July 29th.—Completion of observers' records of weights, capacities, dimensions, etc., etc.

Monday, July 31st.—The vehicles will leave the show-yard about 10.30 a.m. for the manoeuvring, hill-climbing, and other special tests, which it is expected will last until about 5 o'clock p.m.

Tuesday, August 1st.—Run of about thirty-five miles, starting from the show-yard at 10 a.m., chiefly over route "A" of last year.

Wednesday, August 2nd.—Second run of about thirty-five miles, starting from the show-yard at 10 a.m., chiefly over route "B" of last year.

What may be termed the trials proper will occupy Monday, Tuesday, and Wednesday, July 31st to August 2nd inclusive, upon which days light motor-carriages will be provided at fixed charges to carry visitors who desire to witness the behaviour of the competing vehicles upon the road.

It is particularly requested that all intending visitors will at once put themselves into communication with the honorary secretary, L.S.P.T.A., Mr. E. Shrapnell Smith, Royal Institution, Liverpool, so that they may be entered on the list of those to receive notices. During the continuance of the trials the headquarters of the Association will be at the

Adelphi Hotel, Liverpool, where rooms should be engaged in advance.

It is expected that the Post Office, the War Office, and all bodies who were represented last year will send delegates again, in addition to which numerous county, municipal, and other authorities have notified their intention of visiting the competition.

As your coming issue will be put before many new people at the show, and as it is not generally known that Lord Derby takes the interest he does, will you please make some reference to his being our president. It is a coincidence that he is this year's President of the Royal Lancashire Agricultural Society.

Yours faithfully,

Liverpool,  
June 10th, 1899.

E. SHRAPNELL SMITH,  
*Hon. Sec.*

## MOTOR-CARS ON THE CONTINENT.

### Motor-Cars in Spain.

So far the automobile movement has made relatively but little progress in Spain. The subject is, however, beginning to attract attention in all the large towns, and from Barcelona we learn that the municipal authorities of that town have appointed a committee to draw up a series of regulations relating to the control of motor-car traffic. It is also announced that Messrs. Benz & Co., of Mannheim, Germany, are establishing a dépôt in Barcelona for the sale of their well-known motor-vehicles.

### A Hungarian Automobile Club.

AUSTRIA has for some time past had its Automobile Club, and has in this respect been in advance of its neighbour, Hungary. However, the deficiency is about to be removed, for a meeting of automobilists has just been held in Budapest, when the formation of a Hungarian Automobile Club was decided upon and a committee appointed to draw up the necessary rules.

### Motor-Car Race from Amsterdam.

ENCOURAGED by the success of the recent motor-car race at Aix-la-Chapelle, the recently-formed West German Automobile Club has decided to organize a race between Amsterdam and Aix-la-Chapelle, to be run off on Sunday, the 25th inst. The race will be divided into two classes—motor-cycles and motor-cars. The distance is about 260 kilometres, and one of the conditions provides that no competitor will be eligible for a prize who exceeds fourteen hours for the journey.

### The Fontainebleau Rallie Papier.

THE paper-chase competition organized at Fontainebleau by M. P. Lafitte, which took place last Sunday week, was a great success. The track was marked out by M. Tampier and M. Delizy, the contest being run by M. René de Knyff, followed by MM. Leys, Mas, Marcotte, George Prade Audresset, Pinson, Bernheim, De Lueensky, Diligeon and Colomb. In the motor-cycle category, the order was as follows: 1 Cormier, 2 Coldas, 3 Chauveau, 4 Guyenet.

### A Panhard-Levassor Banquet.

THE victory of MM. Charron, de Knyff, Girardot, Gilles, Hourgières, etc., in the recent Paris-Bordeaux motor-car race was celebrated the other day by a banquet, to which the directors of the Panhard-Levassor works invited a number of friends. A very pleasant evening was spent.

**The Volturette Competition.**

As stated in our last issue, the voiturette competition over 100 kilometres of road between Etampes and Chartres was run off on the 16th inst. Of the fifteen entrants only ten started.

The order of arrival was as follows:—

1, Wilfrid (Bollée), 1 h. 59 m. 14 $\frac{3}{4}$  s.; 2, Thery (Decauville), 2 h. 17 m. 13 $\frac{1}{4}$  s.; 3, Strutz (Bollée), 2 h. 18 m. 22 s.; 4, Aubin (Decauville), 2 h. 32 m. 20 s.; 5, Gabriel (Decauville), 2 h. 46 m. 30 s.; 6, Dumond (Decauville), 3 h. 6 m.; 7, Cornilleau (Decauville), 3 h. 39 m.; Ravenez, Balray, and Yamin, did not finish.

**The Concours de Fiacres.**

We are now able to give the times occupied by the competing vehicles on the first six days of the trials.

| No. | Competitors.     | Type of Carriage.   | Nett Running Time. |             |             |             |             |             |

| 5   | Jeantaud         | 2-seated cab        | 3.27.4.40          | —           | 4.34.4.40   | 4.40.4.45   | —           | —           |
| 6   | Jeantaud         | 2-seated Coupè      | 3.46.4.9           | 8.8. —      | 3.18.3.43   | 3.20. —     | —           | —           |
| 7   | Jeantaud         | 2-seated Mylord     | 3.40.3.40          | 3.38.5.31   | 3.19.3.27   | —           | —           | —           |
| 8   | Mildé            | Light delivery van  | 3.30.3.24          | 4.37.4.30   | 2.59.3.47   | —           | —           | —           |
| 9   | Krieger          | 4-seated Coupè      | 4.14.4.12          | 4.26.3.12   | 4.19.4. —   | —           | —           | —           |
| 10  | Clement          | Light delivery van  | 3.26.3.21          | 3.21.3.28   | 3.15.3.7    | —           | —           | —           |
| 11  | Panhard-Levassor | 2-seated Coupè      | 3.21.3.12          | 3.3.3.3     | 2.59.3.26   | —           | —           | —           |
| 12  | Panhard-Levassor | Light delivery van  | 3.51.3.33          | 4.22.4.22   | 3.15.3.35   | —           | —           | —           |
| 13  | Jeantaud         | 2-seated drossky    | 3.38.3.29          | 3.37.3.37   | 3.16.3.24   | —           | —           | —           |

So far as the trials have gone, the opinion is held that although in general appearance the vehicles are unaltered from last year, yet considerable improvements have been effected in the motors, and transmission and control gear, the result being a greatly enhanced efficiency.

**A Motor-Car Fete in Paris.**

LA Fête Automobile des Tuileries, which took place in Paris on Monday afternoon last, was a brilliant success. Under a scorching sun a large crowd gathered on each side of the central avenue of the Tuileries Gardens. The proceedings commenced at 3 o'clock when half-a-dozen motor-cyclists careered off down the avenue tilting at rings, and came back, having caught them all, and beaming with the triumph of a not very arduous victory. Then came a so-called obstacle race. The course had been strewn with painted wooden dummies, and the competitors had to thread their way at full speed in and out and around them. This event had been arranged "to reassure pedestrians, and show them that there is no vehicle safer in street traffic than an automobile," and was a great success. After this M. Jenatzy gave an exhibition of the speed of his electric racing car the "Jamais Content" electric motor. But the *clou* of the meeting was the procession of floral auto-cars. Most of the theatres were represented, a number of private individuals also taking part in the procession with cars and motor-cycles, which were marvels of good taste in floral decoration.

**The Re-opening of the Automobile Club.**

EVERYONE interested in the motor-car movement will be pleased to learn that on Monday the French Automobile Club was authorised to re-open its doors. The step is stated the result of a visit paid to President Loubet by Baron van Zuylen.

**Trade Announcements.**

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797.

LARGE STOCK of Motor-Car Tricycle Frames, with all latest improvements; two band brakes, cased in pattern axle, free chain, hubs and pedals, and all connections ready to attach to motor; electric connection in handle-bar; highly enamelled and plated.—Brown Brothers, Ltd., Great Eastern Street, London, E.C.

MOTORS ON HIRE.—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

**SALES, WANTS, Etc.**

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

FOR SALE.—Electric Victoria, quite new, made by Thrupp and Maberly of London, the motor by Immish & Co.; in first-class condition. Price £200. For further particulars and order to view apply to C. A. Goffin, Minehead, Ouseley Road, Balham, S.W.

FOR SALE.—Mytholm Motor-Car, double cylinder, 3-h.p. petrol motor, three speeds, ball bearings, rubber tires, £110. Photo, three stamps. Also 8-h.p. two-cylinder Mytholm Petrol Motor, complete with tube ignition and carburettor, £55. 3-h.p. two-cylinder Mytholm Petrol Motor, £32.—Brown & Buckton, Hipperholme, Halifax.

WANTED to Hire, by a Dental Practitioner in Ireland, a small Motor-Car or Tricycle, suitable for two persons. De Dion preferred.—Apply Box 101, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

FOR private use or passenger traffic.—Benz Phaeton with box seat for driver, handsome carriage, leather hood and aprons; seat six; been little used; in good order; will accept £195.—Apply by letter to H. S. Eyre, 6 Grosvenor Gardens, St. Leonards-on-Sea.

3 H.P. COVENTRY MOTETTE, carry two persons, English manufacture; cost £150, will accept any reasonable offer; good condition.—C. Watson, 97 Upper Stone Street, Maidstone.

MOTOR-CARRIAGES, deliverable directly, system Panhard, Benz, Peugeot, Mors, Decauville, Cambier, Rochet, Silmeider; tricycles.—Apply to Géo. de la Nézière, 51 rue Vivienne, Paris.

WANTED.—Situation as Driver and Repairer of Motors. Seven years' experience in making, driving, and repairing explosion engines and cycles.—E.W. Dewbury, High Street, Ware.

FOR SALE.—Beeston Motor-Tricycle, almost new; owner going in for Motor-Car. Will accept £55.—Nesham, 25 Bright Street, Middlesbrough.

FOR SALE.—Benz 5-h.p. Dog-Cart, nearly new; written guarantee given as to condition; many improvements added.—Price and full particulars to Box 72, *The Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

BOLLÉE, in good order, £60; Motor-Tricycle, tube ignition, £50. Both fast machines.—Owner, 83 Cautsfield Street, Liverpool.

FOR SALE.—Benz Ideal Car, only used a few weeks. Can be seen by appointment at Maidstone or Richmond next week.—A. Clark, Soham.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, JUNE 23rd, 1899.

[No. 16.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### The Agricultural Hall Exhibition.

By the time our next issue is published, arrangements will be approaching near completion for the opening of the Motor-Car Exhibition at the Agricultural Hall. The ground floor is fully let, and we shall have at least twenty-five additional exhibitors to those that were to be seen at Richmond. The Agricultural Hall is an ideal place in which to hold an exhibition. It is easy of access from all points of the compass, and the exhibits will be compactly arranged and attractive in form. A first-class band will play afternoon and evening. A strong committee of the most expert "motorists" in the kingdom has been formed to arrange for motor sports and competitions every evening, and demonstrations will be continuous in the arena all day long. The "commercial efficiency" tests will start and finish daily from the Hall, and the London Motor-Van and Wagon Co. will have a fleet of vehicles for hire in the court-yard. The Exhibition will be open from 10 a.m. to 10 p.m.

### "Terrors."

Engineering seems to forget its function when it alludes to motor-cars, and ceases to remember that it is an organ representative of the industries reflected by its own name. In its last issue, commenting on the Automobile Club trials, it says: "Some of the carriages under way were simply terrors from the rattle and noise they made, and the reckless way they were driven. A great deal remains to be done before the average motor-car approaches the horse-drawn carriage simply as a pleasure vehicle; unless it be, perhaps, in the eyes of mechanical cranks or amateur engineers who desire to pose as scientific experts." The whole report, nearly two columns long, is garbled and incorrect, and the writer has not even the ability to correctly copy information when it is supplied him. He states, referring to the fifty-mile trials, that it was difficult to distinguish between spectators and competitors, but that from a list kindly lent him by the assistant secretary he found there were ten competitors. That same list was shown us, and we counted twenty-one competitors (starters); and again, the former were distinguished from spectators by having affixed to the front of their machines a number at least a foot square.

### Eight Thousand Motors.

The financial papers do not like either motors or motor-car companies, judging from the fact that rightfully or wrongfully they never lose an opportunity of attacking one or the other—yet the industry progresses. More cars are being ordered than can be supplied, and, speaking generally, people who have once ridden are usually keen on having a second ride, and if their means permit a car is ultimately purchased. One patentee has such confidence in the future that he is placing orders to the extent of eight thousand motors, all to be supplied before the end of 1900, and

engineering firms of repute are pleased to accept from the same patentee orders to the extent of a thousand motors each!

### Unfortunate.

THE Rev. Mr. Grindle, of Cold Ash Vicarage, Newbury, has been writing to a local paper suggesting that there is need for some special regulations concerning motor-cars. His reason for thus writing is that one day last week his daughter nearly had a serious accident through a motor-tricyclist not stopping, when signalled to, until he was close upon her. The horse bolted, but fortunately no harm was done. The same day a motor suddenly turned a corner while the lady was still on horseback, and this time she was thrown, but escaped without injury. The Rev. Mr. Grindle bitterly complains, as a heavy ratepayer, that the roads cannot be used with safety by horse-riders, and charitably calls upon the County and District Councils to make stringent bye-laws and to see that they are enforced. Mr. Grindle seems to forget that possibly those who ride motor-cars pay rates, and that some of them may pay even heavier rates than he does, also that it strikes motor-carists that people who ride untrained horses are also somewhat of a nuisance; and it is not always the owner of a thoroughbred who gives the most trouble. In fact, in many instances it is not the horse at all that is nervous; the horse is mostly curious. It is the driver or the rider who frightens the horse by communicating his own fear.

### Falkirk Motor-Car Co.

At the last meeting of the Stirling County Council the Clerk stated that as to the speed of the motor-cars enquired into at last meeting he found from the Highways Act of 1896 that the limit was fourteen miles an hour, but the Local Government Board might make other regulations. Mr. Hunter said if the Motor Car Company's business was managed in the future as it had been during the last month he would not complain. Everybody seemed satisfied that the few words he had spoken at the last meeting had done a great deal of good.

### Road Maps.

MR. HARRY R. G. INGLIS, whose "Contour" road books have previously been noticed in these columns, has now brought out capital maps of the Brighton and Ripley roads, each 20 in. long, but folded in book form and so arranged that fourteen miles are exposed to view at any opening. The lettering is exceedingly clear, and the contour plan is placed by the side of the ordinary map, so that the two references to any particular place can be seen at a glance. Messrs. Gall and Inglis, who publish this very convenient road map for motorists and cyclists, also send their Bath road and Southampton road maps, likewise compiled by Mr. H. R. G. Inglis, whose knowledge of British roads is becoming extensive. In both of these the same conscientious regard for accuracy is observable, the gradients being given as fully

as in the case of the Brighton and Ripley roads. The road map to Southampton is extended through Christchurch and Bournemouth to Poole, thus including some of the best scenery in the New Forest. In addition to this map and contour plan the gradients at various distances are given in the letterpress, which has also a description of the road and a brief summary of the objects of interest on the way.

### III-Luck.

THE big Daimler Post Office vans seem fated to have ill-luck, and it was certainly unfortunate that one should have been allowed to "run amuk" while in charge of a drunken driver. What might have happened had there been much traffic it is serious to think about, but we are glad to state the only damage done was the smashing of a large plate-glass window. The van had its front board cracked, but was otherwise uninjured, and was driven back to its depôt the same night. The driver was lightly let off with 40s. or a month.

### "Get Off."

A CORRESPONDENT writes to an Edinburgh paper complaining that, being in a hurry, and seeing a motor-car with only four occupants in it standing at the side of the road, he jumped in, and was considerably hurt at being rudely told to "get off." He thought the car was one of those plying for hire between the Haymarket and Salisbury Road. The suggestion is that the lettering at the sides on the public vehicles should be bolder.

### M.P.'s and Motor-Cars.

THE motor-car has invaded Palace Yard, and to the weary M.P. the chance of a ride on a friend's automobile will have an exhilarating effect. Several legislators saw the "meet" on Saturday last, and on Tuesday evening a popular Scotch Member motored to the House. Sir Samuel Montagu, M.P., has also favoured the latest form of road locomotion, he being the possessor of two dainty cars, the envy of the less wealthy legislators who keep to the cab or the cycle. Mr. William Allan, the poet-Parliamentarian, may also yet be found among the motor-carists of St. Stephen's.

### The "Lifu" at Work.

SURELY one of the busiest and most industrious vehicles ever constructed is the "Lifu" wagonette. On the Whitsuntide tour of the Automobile Club it was always the smartest and tidiest vehicle; always ready for the start, and invariably did its journey without trouble. Since then it has been employing its leisure by making frequent trips between London and Portsmouth; while at Richmond it must almost have restored equilibrium to the coffers of the Show Committee. The number of journeys taken out of the ground must, we imagine, have totalled nearly a hundred. The charge for passengers has been one shilling per head, and the car has not only been full, but at times passengers have had to wait their turn. The "Lifu" is English in construction, and, typical of its country, suffers from thirst, and takes an occasional sixty-gallon drink—but it is a wonderful vehicle.

### A Sad Accident.

It appears that the Altrincham disaster arose from the breaking of a faulty casting in connection with the steering. The car was an old one, and had been in use for a long time, not having been overhauled for many months. It was kept in constant service, and was reputed to have done the work of two horse-drawn vehicles. Not only the body of the vehicle but the hind wheels were burnt

as well. The car fell sideways on to its nose, then turned into a ditch, burying the driver underneath. The driver, although burnt and badly bruised, is doing well.

### Richmond Awards.

AT the moment of going to press we received the following wire from Mr. Johnson, Secretary of the Automobile Club:—"Following awards made: Gold medals to Daimler, Lanchester, Delahaye, Thornycroft, Motor-Carriage Supply; silver medals to Hewetson's, Daimler, Automobile Association, Motor-Carriage Supply."

A NEW firm has just been registered at Puteaux, France, under the style of Messrs. Patin & Requillart, to construct electrical motor-vehicles.

THE Sampson Engineering Company, Limited, has been registered with a capital of £5,000 in £1 shares, to carry on the business of cycle, motor-car, and accessory manufacturers, etc. The registered office of the Company is at 19 Sampson Road North, Birmingham.

WITH reference to the water-cooling tubes of Messrs. Grouvelle & Arquembourg, of Paris, illustrated and described in our last issue, we learn that the sole licence for the manufacture of the same in Great Britain and Ireland has been secured by Messrs. Lawrence & Co., of 132 Latimer Road, London, W.

As a motor-carriage was proceeding towards Victoria Station on Friday morning last, when outside the Grosvenor Hotel, Buckingham Palace Road, S.W., a horse attached to a brake containing several ladies and gentlemen took fright, and dashed into the motor-car, smashing the front of that vehicle. One of the occupants of the brake, Mrs. Nightingale, of Notting Hill, was thrown out and so severely injured that she had to be removed to Westminster Hospital, where she was found to be suffering from concussion of the brain.

THE Newcastle and District Motor-Car Co. has just been registered with a capital of £10,000, in £10 shares, to carry on the business of motor-car proprietors, carriage, cab, omnibus, tram, coach, perambulator, bath-chair, and cycle manufacturers and dealers, electric and general engineers, iron and brass founders, tire manufacturers, rubber merchants, etc. The subscribers are: John Duncan, 22 Blackett Street, Newcastle, wine and spirit merchant; J. Daglish, 44 Percy Gardens, Tynemouth, brewer; F. Graham, Bank Chambers, Newcastle, iron and steel merchant; F. G. Scott, Queen Street, Newcastle, engineer; W. Bird, 8 Latimer Street, Tynemouth, engineer; T. W. Rowe, Ridley Street, Newcastle, merchant; J. A. Williamson, St. Nicholas Chambers, Newcastle, solicitor. The number of directors is not to be less than three nor more than five; the subscribers are to appoint the first; qualification, £100; remuneration as fixed by the company.

A MOTOR-CARRIAGE trip of 700 miles, from Cleveland, O., to New York has just been completed in less than 4½ days. The trip was made by Messrs. Alexander Winton and Charles B. Shanks, of Cleveland, in a Winton petroleum-spirit motor-phæton. The vehicle complete weighed 1,800 lb., and it was fitted with large pneumatic tires. The start was made from Cleveland at 7 a.m. on May 22nd, and Buffalo, 218 miles away, was reached by 9.15 p.m. of the same day. Between Buffalo and Freeport the front axle broke, and another was received from Cleveland and put in place. From Freeport to Syracuse, 80 miles, the running time was 8 hours; the 147 miles to Albany took 13 h. 55 m.; the remaining 161½ miles from Albany to New York required a little less than 11 hours. The 707½ miles were made in 4 d. 11 h. 45 m. running time, an average of 6.56 miles per hour. The roads from Cleveland to Buffalo were fairly good, but between Buffalo and Albany they were heavy, and no great speed could be made. At times on the trip a speed of 30 miles per hour is stated to have been attained.

# The Automobile Club Show.

## THE OPENING DRIVE.

A BRILLIANT contrast between the old and new methods of fashionable locomotion on ordinary roads was presented to a roving gathering of pedestrian club-men, M.P.s, and others in the neighbourhood of Whitehall, London, on Saturday last. In front of the great hotels in Northumberland Avenue many coaching parties assembled shortly before eleven o'clock, and they went on their way in splendidly horsed coaches, and to the accompaniment of the horn which has been associated with such equipages from time immemorial. Round the corner another gathering, even more representative of the higher aspect of social life and fashionable precedence, was assembled to journey to Richmond by means of mechanical power, the hooter providing the warning sounds and the Automobile Club giving a prestige that raised the motor-car high above ordinary commercialism and business. For the appearance of the ladies revealed the fact that this was no ordinary assemblage, and as the procession in which they were conspicuous passed the clubhouse shortly after eleven o'clock the aristocratic character of the event was obvious.

Lord Rothschild, Lord Suffield, and Lady Muriel Paget were among those who drove on motor-cars. The Earl of Rosse, the Hon. Clare Parsons, the Hon. Gerald Lascelles, and Mr. F. R. Simms were on a Canstatt Daimler; Sir Francis Jeune, Lady Jeune, and Miss Stanley were on a Daimler, as was also the Hon. J. Scott Montagu, M.P., with Lady Cecil Scott Montagu of Burleigh, Mr. Ernest Beckett, M.P., and Mr. Lionel Phillips; the Hon. C. S. Rolls drove Lord and Lady Llangattock; the Hon. Evelyn Ellis, with Mrs. Evelyn Ellis and General Sir Arthur Ellis, were on a Panhard car; Sir Richard Paget and Mr. Roger W. Wallace, Q.C., on electric-cars; and Mr. and Mrs. J. R. Hargreaves were on their twin Daimler; the Duke of Newcastle and Lord Henry Pelham Clinton were on a Delahaye car; Lord Loch on a Daimler; the Hon. Alfred Mulholland and Mrs. Mulholland on a Panhard, as were also Mr. and Mrs. Weguelin, and Mr. Alfred Bird; Sir David Salomons and Mr. A. Barr were on a Peugeot car, with a seat for the attendant on the lower front of the splashboard; Mr. Roger H. Fuller and Mrs. Fuller were on a Daimler car; a 5½-h.p. Iveagh phaeton contained Mr. John S. Gretton, Mr. and Mrs. Max Lindlar, Miss Teresa del Riego, and M. Ernest Cuenod; Mr. C. Friswell drove the Mors car that won the Paris-Amsterdam-Paris race; Madame Zacharias was on a Hercules; and General Sir Arthur Willis, Captain and Mrs. Langrishe, the Hon. J. H. Berkeley, Mr. Lionel Phillips, Mr. Arthur Mulliner, and Mr. Critchley were among others whom we noticed.

A few minutes after eleven the start took place, a string of seven vehicles leading the way. Thirteen others followed in succession a few minutes later, so rapidly that it was impossible to distinguish all the occupants, some of whom had arrived at the last moment, but among those who had previously signified their intention to be present, and whose names do not appear in the foregoing list, were the Earl of Shrewsbury, Sir W. Neville Abdy, Bart., Mr. W. Carlisle, M.P., Professor Boverton Redwood, and Mr. Frank Butler.

Everything started well, without hitch or mishap, the lessened vibration and noise, as compared with earlier meets, being one of the most noticeable features. Just as the last car turned into the Horse Guards Avenue one of the vehicles of the London Steam Omnibus Company came round the corner, and the crowd, which, though select had never been large, having gazed on this demonstration of "commercial possibility," dispersed. Mr. William Allan, M.P., who had been observing the various vehicles as critically as if they

had contained Belleville boilers likely to form the basis of another criticism on the navy, was among the last to leave the scene; and then Whitehall resumed its normal aspect while the procession of motor-cars wended its way through Trafalgar Square, Pall Mall, St. James's Street, Piccadilly, Hyde Park, Queen's Gate, Brompton Road, Redcliffe Gardens, Fulham Road, Putney Bridge, Norrey Road, Manor Road, Kew Road, thence to Richmond.

The opening ceremony duly took place in the midst of a large assemblage of members and friends. In addition to a number of horse-drawn vehicles, some seventy to eighty motors were on the ground. The weather was of the brightest, and remained so up to the time of going to press. During the week various races were held between a trotting horse and motor-tricycles, etc., and efforts were made to keep matters lively. The cinder track was badly cut up the first day, and afterwards the grass track was used. The attendance during the week did not come up to expectations. Below is a full description of exhibits.

## THE EXHIBITS.

One of the first exhibits to attract attention on entering the Exhibition is that of the Motor Manufacturing Co., Ltd., of 47 Holborn Viaduct, E.C., and Coventry. The display is of a very varied character, comprising no less than five distinct types of vehicles. First we find motor-tricycles fitted with a 1½-h.p. English-built motor of the De Dion type, one of the machines shown having a frame adapted for a lady. A two-seated motor-quadracycle is also displayed, while the second type is to be found in a three-seated Bollée voiturette adapted to seat two persons in the front, with the driver at the rear. Class No. 3 is to be found in the Panhard-Daimler type vehicles fitted with a 5½-h.p. motor on a standard frame. Of these several are shown, ranging from a neat four-seated dog-cart to a nine-seated *chairs-a-banc* of the kind which is now being employed for public services in various parts of the country. In this class must also be included two motor parcels vans capable of carrying loads up to close upon one ton. Type No. 4 is to be found in the Sandringham phaeton. This is a four-seated vehicle of the type introduced towards the end of last year. It is fitted with a 6 h.p. Iden horizontal motor, four forward speeds and one reverse motion being available. The principal novelty at this stand is, however, the Princess two-seated sociable car. As this vehicle was illustrated in our issue of May 26th, it is unnecessary to describe it at length. It may be mentioned, however, that the motor is of the two-cylinder horizontal type of 4½ h.p., with tube ignition and water-jacket. The power is transmitted from the motor shaft to the counter shaft by spur wheels and from the latter to the rear road-wheel axle by a central single chain drive. Three forward speeds and two reverse motions are provided, while a special feature is the provision of a governing device by means of which when the car is at rest the motor may be kept in motion, but slowed down to the extent of but one explosion per minute. The vehicle, which weighs complete only 8½ cwt., is provided with a detachable splashboard, in place of which a small additional front seat can quickly be fitted. The new car is very handsomely finished, and altogether is a vehicle which should rapidly attain popularity in the automobile world.

Although at first glance the vehicles exhibited by the Daimler Motor Co., Ltd., of Coventry and Shaftesbury Avenue, London, W.C., would seem to show but little change from those of a year ago, yet closer inspection brings to light that a good many modifications and improvements have been adopted with the view of increasing the efficiency of this well-known type of motor-vehicle. Of the standard 5½-h.p. type six vehicles are shown, viz., a "Universal" sporting car,

convertible to dog-cart, phaeton, or wagonette, a Cranford wagonette, two Rougemont wagonettes, a "Marseilles" phaeton, and a parcels delivery van capable of carrying a load of 15 cwt. Most of the foregoing vehicles are provided with four speeds, ranging from four to sixteen miles per hour, together with a backward motion. Stronger gearing is now being fitted into the vehicles, while larger bearings generally are being employed. The Daimler Company are also now fitting their vehicles with a water-cooling coil, by the use of which the amount of water to be carried for cooling purposes is reduced to four gallons, sufficient, the makers state, for an ordinary day's run, without it being necessary to refill the water tank. The vehicles of this Company which have undoubtedly attracted most attention during the week are the new light two-seated carriages illustrated in our issue of the 9th inst., to which we refer our readers for further particulars. One of these is fitted with a 4-h.p. motor, and the other with a motor capable of working up to  $5\frac{1}{2}$  h.p. The latter car weighs complete only 9 cwt., and is fitted with two speeds, eight and sixteen miles per hour, a hill-climbing gear giving four miles per hour, and a reverse motion. The Daimler Co. also exhibit two huge G.P.O. delivery vans and a six-seated Siamese phaeton. The latter is an interesting vehicle; it is adapted to carry six persons, and is fitted with a four-cylinder motor of  $11\frac{1}{2}$  b.h.p. Four speeds are provided, the maximum being twenty-eight miles per hour. The steering is controlled by means of a hand-wheel, the shoe brakes being also actuated in the French style by a hand-wheel and screw gear. On this car, we also note the employment of a neat patent-leather cover to the driving chains. The Daimler Co. is also, we understand, now arranging to build large wagonettes and *chairs-a-bancs* to accommodate from sixteen to twenty passengers, the vehicles being specially adapted for public motor-car services.

So large and varied is the exhibit of the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, London, W., that it is difficult to know where to begin and where to end. It is simply impossible to attempt to fully describe all the vehicles on view, the brief epitome given in the catalogue alone occupying nine pages. We must confine ourselves, therefore, to a mere mention of the better known types, and to a brief description of the newer vehicles, deferring to a later date a more complete account of at least one of the new types of cars shown at Richmond for the first time. Dealing first with motor-tricycles, two types are shown—the Autocycle (a German-made machine), and the French-made Barrière. In addition to the ordinary tricycle, two new forms of the latter are shown, one arranged, with a longer base than usual, as a parcel carrier, and one, a motor-sociable-tricycle, arranged to seat two riders side by side. Trailers for motor-tricycles are shown in a great variety of forms. Coming now to petroleum-spirit motor-cars, the first to be noticed is the "Tourist," a Belgian-made, three-wheeled, two-seated vehicle. The motor is of  $3\frac{1}{2}$  h.p., with radial discs for cooling, and electric ignition. Three speeds are available, the maximum being about twenty miles per hour. The "Orient Express" type of car is shown in three forms—the Duc, the Victoria, and the Vis-a-vis, the two first-named seating three and the latter four persons. The "Duc," which was illustrated in our issue of April 21st last, to which we refer our readers for further particulars, is fitted with a 4-h.p. motor, the Victoria ditto; while the Vis-a-vis has a motor capable of working up to 6 h.p. The ignition is magneto-electrical, the cylinders are water-cooled, and the transmission is by means of belts with jockey tighteners. The "Orient Express" cars, which are of German construction, are exceedingly elegant in design, and by reason of their relatively low cost should soon become very popular. Several of the well-known Mors four-seated vehicles are shown, as also one of the new Mors two-seated 4-h.p. "Ducs," illustrated and described in our issue of March 10th last. The productions of Messrs. Ducroiset, of Grenoble, France, are represented by a twelve-seated

"Hercules" wagonette. This car is fitted with a 15-h.p. horizontal double-cylinder motor, located in the front portion of the car. The ignition is electrical, and the cylinders are water-jacketed. The transmission is by means of belts, which normally run slack and are tightened by jockey pulleys. Three forward speeds—6, 12, and 20 miles per hour—and one backward motion are provided. The car appears to be built on sound lines, and seems likely to fulfil the requirements of any one needing a motor-vehicle of so large a character. Quite a new car to this country—in fact, the one shown only arrived from France a day or two before the Exhibition opened—is the "Silent" car, made by Messrs. Gobron & Brillié, of Paris. It is claimed that these are the first cars driven by a petrol motor, which are absolutely free from vibration. The frame of these vehicles is built up of tubes, and the body attached through the medium of indiarubber springs, in addition to the ordinary plate springs. In the motor there are two vertical cylinders; each cylinder has two pistons, the explosion taking place between each pair. The two lower pistons are connected by the rods to the cranks in the usual way; the connecting rods of the two upper pistons are bolted to the crosshead, at the extremities of which are the two double connecting rods, which work on the cranks, fixed 180 degrees from the others. There are thus in this motor four pistons, and in effect four cylinders, four cranks, and four connecting rods. Notwithstanding this large number of moving parts the motor is stated to run remarkably smoothly, this being due to the great care that has been taken in the design so as to secure absolute balance as far as possible, there being an impulse to the motor shaft every revolution. The admission and exhaust are operated in the usual way, but a special device is used to graduate the admission of petrol to the carburettor. The cylinders are water-jacketed, and the water circulated by means of a small plunger pump. The hot water passes through a radiator coil in the front of the car. The water tank holds about 4 gallons. As regards the gearing there are three forward and one astern speeds. The top speed is about 20 miles. These vehicles are good hill climbers, the Chanteloup being surmounted at an average speed of 5·8 miles per hour.

The motor, which is of 6 h.p., runs normally at 700 revolutions per minute. Three forward speeds, ranging up to twenty miles per hour and one backward motion are provided. The transmission is effected by gear wheels, there being two intermediary shafts, a friction clutch being arranged on the fast one, the connection between the second intermediary and the rear road-wheels being effected by chain gearing. The car, which is very elaborately and comfortably finished, takes the form of a five-seated wagonette. It comprises so many novel features as regards both the motor and the transmission gear that we propose to refer to it again at greater length in a subsequent issue.

Other exhibits comprise the Koch heavy oil motor-phaeton, illustrated and described in our issue of March 17th last, a Cambier dog-cart, a 16-seated 15-h.p. Benz brake, a couple of Vallée cars, a Lynx dog-cart, and a Lynx light parcels van, pressure on our space preventing us from doing more than briefly mentioning their names. The Automobile Association is also showing an "Imperial Star" 2-seated carriage built by the Star Motor-Car Co., of Wolverhampton, the car being an English facsimile of the well-known Benz carriages. The Association had also hoped to be able to show a De Dion 2-seated 4-wheel voiturette, the Swan (Elieson) electric dog-cart, and a Waverley Stanhope, the latter being a new electrical car of American construction, but at the time of writing (Tuesday morning) these had not put in an appearance.

In addition to vehicles, the Automobile Association display a large range of motor-car and cycle accessories, including magneto-electric ignition devices, carburettors, batteries, etc. They have also taken up the agency for the Dorey petroleum-spirit motor, illustrated in our issue of April 21st last, of which several sizes are shown. They are

also exhibiting a new instantaneous steam generator for motor-cars, designed by Mr. J. H. Knight, of Barfield, Farnham. The generator is constructed to burn either coke or oil, and will, it is claimed, evaporate 70 lb. to 75 lb. water per hour, equal to 3 or  $3\frac{1}{2}$  i.h.p. with a good compound engine. The boiler consists of a coil of steel tubing heated in a suitable furnace. To obviate the choking of the tubes, Mr. Knight fills them with small balls which can move freely in the tube for a short distance. These, by checking the flow of water through the lower coils of the tube, cause, it is asserted, the steam to come off very quietly, while, as the balls are in constant movement, all scale and deposit is, it is claimed, cleared away.

The popular little Benz motor-cars are kept well to the front by Messrs. Hewetsons, Ltd., of Dean Street, Oxford Street, London, W., who have about a dozen cars of different types on view. It is difficult to say much that is not already known of these cars. It may be mentioned, however, that the 1899 type of "Ideal" two-seated car is fitted with three forward speeds, including a hill-climbing gear, by means of which it is claimed the vehicle can readily mount gradients of 1 in 4. The various details of the car have also been modified and strengthened as experience has shown to be necessary, the result being a little carriage which is well intended to maintain the already great popularity of this firm. One of the cars shown is provided with a detachable front seat so that it can readily be adapted to accommodate three persons. A Benz dog-cart is also on view. This is capable of seating four passengers, and is fitted with a double-cylinder motor of 5 h.p. Fitted with three speeds forward and one astern, this car will, it is claimed, maintain an average speed of eighteen miles per hour, and mount gradients of 1 in 6. Messrs. Hewetsons have also on view a large Benz brake capable of accommodating ten persons. The mechanism of this car is on the same lines as the other Benz vehicles, the counter-shaft being belt driven, with three forward speeds and one backward motion. The motor of this vehicle is a double-cylinder one, capable of working up to 8 h.p.

Another large stand is that of the International Motor-Car Co., of 15 High Road, Kilburn. It includes, of course, a number of their well-known little International cars, which are now being fitted with petroleum-spirit motors of  $4\frac{1}{2}$  h.p., of English make, and a crypto gear, which enables them to mount even the steepest of hills. This Company have also recently adapted these cars to seat three persons, by arranging an additional seat in place of the ordinary splash-board; the seat is so fitted that it can readily be removed and the splash-board re-attached when desired. A car on the stand which has attracted considerable attention during the week is a five-seated Parisian Victoria, built in Paris to the order of Baron de Zuylen de Nyvelt. The car, the carriage-builder's portion of which is of a high-grade character, is fitted with a two-cylinder Benz motor, capable of working up to 9 h.p. The transmission gear is also of the Benz type, three forward speeds and two reverse motions being provided. Another car which is claimed to be suitable for public motor-car services is a French-built brake, on the Benz system, capable of accommodating fourteen passengers. The motor is of the two-cylinder petroleum-spirit type of 12 h.p. The transmission is effected by means of belts; three forward speeds, including a hill-climbing gear being provided. The cylinders are water-jacketed, a double water tank, a circulating pump, and a water-cooling coil being provided. The wheels are fitted with rubber tires, while brakes of the Lehut type are arranged to act on the hubs of the rear wheels. The International Co. are also showing a

light parcels van fitted with a 3-h.p. Benz motor, claimed to be capable of carrying a load of 3 cwt. at speeds ranging from three to sixteen miles per hour, and a new Victoria. The latter, which has seating accommodation for five persons, is provided with a single-cylinder motor of  $7\frac{1}{2}$  h.p. The transmission gear is arranged to give three forward speeds and one reverse motion, a clutch mechanism being also provided by means of which the motor can be instantly thrown out of gear.

A car which, although it has been on the market for some time in France, where it is built, but which is new to this country, is the "Delahaye," exhibited by the Delahaye Motor-Car Co., of Donington House, Norfolk Street, London, W.C.. The vehicle on show at Richmond, which has come in for a large amount of attention during the week, is a four-seated phaeton (Fig. 1), a detachable seat being also provided so that it may accommodate five persons. The motor is a two-cylinder one of 8 h.p.; it is of the horizontal petroleum-spirit type, with water-jacket and electrical ignition. The transmission of the power is effected by means of belts to an intermediary shaft, three forward speeds and one astern motion being provided. A hill-climbing gear is also fitted, by means of which gradients of one in six can, it is claimed, be mounted. From the intermediary shaft to the rear road-wheel axle the power is transmitted by the usual driving wheels and sprocket chains. The cylinder-cooling water-circulation is maintained by a pump, a special condensing coil being arranged under the fore part of the carriage. A feature of the Delahaye car is that the speed of the motor is not regulated as desired by the electrical ignition device, but by varying the quality of the explosive mixture allowed to pass to the explosion chamber, the control being by means of a small foot pedal. The road

FIG. 1.—THE DELAHAYE PHAETON.

wheels have wooden spokes, and are fitted with stout pneumatic tires. The steering is of the ordinary type, while as regards brakes three are provided—band brakes on each of the rear wheel hubs, and a band brake around the differential gear. The car, which can attain a maximum speed of twenty-seven miles per hour, weighs complete about 19 cwt., the frame being built of steel tubing.

The main feature of the exhibits of the Southern Motor-Car Co., of 59 Brixton Road, London, S.W., is the "Georges Richard" light two-seated petroleum-spirit motor-carriage known as the "Duke" (Fig. 2). The car, which has a neat and attractive appearance, is French built, and is very much on the lines of the well-known Benz carriages so far as the motor and power-transmission mechanism is concerned.

The motor is of the single-cylinder type, capable of working up to  $3\frac{1}{2}$  h.p. It is located in the rear portion of the vehicle; its normal speed is 750 revolutions per minute, but it may be varied from between 300 and 1,200 revolutions by means of a

FIG. 2.—HE "GEORGES RICHARD" DUKE CAR.

button controlling the quantity of carburetted air admitted to the explosion chamber and also by advancing or retarding the electrical ignition. The cylinder is water-jacketed, a series of tubes for cooling the heated water being contained in the rear portion of the body. Three changes of speed—5, 12, and 20 miles per hour—including the new hill-climbing gear of the crypto type, are provided, the transmission being effected by means of belts working on fast and loose pulleys. The speed control-levers are all mounted on the steering standard. Two brakes are fitted, one acting on the rear road-wheel tires, and one, a band brake acting on collars attached to the rear wheels. The last-mentioned brake is so arranged that when applied the driving belts are at the same time shipped on to the loose pulleys, thus disengaging the motor from the power transmitting mechanism. The road-wheels are of the suspension type, fitted with pneumatic tires. The Company are also exhibiting a De Dion  $1\frac{1}{2}$ -h.p. motor-tricycle, a De Dion motor-quadricycle for two persons, and a Papillon motor-tricycle, while in addition they have on view a large range of motor-cycle and motor-car accessories, such as horns, tool bags, dry batteries, mudguards, etc., etc.

La Société des Voitures Automobile des Etablissements Decauville Ainé, 13 Boulevard Malesterbes, Paris, exhibit half a dozen of their voiturettes (Fig. 3), which have become very popular in France, and which are now being prominently brought before the notice of the English automobile world. The motor is of the petroleum-spirit type on the lines of the well-known De Dion; it is fitted under the rear portion

of the vehicle, and is enclosed in an aluminium casing. It comprises two cylinders, and is capable of developing up to 3 h.p. Electric ignition is adopted, while the cylinders are cooled by means of a series of radial discs fitted around them.

Two oil-storage reservoirs, with one of which the carburettor is combined, are provided, their capacity being 17 litres, or sufficient, it is stated, for a run of 150 kilometres. The cranks are set at an angle of  $180^\circ$  to each other. The ignition of the charge in each of the two cylinders is effected by means of a single cam. The starting and stopping of the motor is affected by means of a little hand wheel on the right, which controls a small bevel wheel gearing with a similar bevel wheel on one end of the motor-shaft. The power is transmitted from the crank shaft to the rear road-wheel axles through bevel gearing, two rates of speed being provided, although a three-speed gear is now being fitted to some of the cars. Intermediary speeds can be obtained by advancing or retarding the electrical ignition. The front portion of the carriage is connected to the front wheels by a special arrangement of springs. A chest at the front, which also forms a seat for a child, contains the accumulator, the induction coil, and a small lubricating oil tank capable of holding 5 litres. The frame of the carriage is built up of steel tubing. The wheels, which are all 27 in. in diameter, are of the cycle type fitted with pneumatic tires. The steering is effected through a handle-bar of the bicycle type, on one branch of which a commutator is fixed to make or break the electrical circuit, and so control

the engines. The over-all length of the carriage is  $7\frac{1}{2}$  ft., the width 4 ft., while the weight is about  $4\frac{1}{2}$  cwt. Ample brake-power is provided, there being a double band-brake on the differential gear, and band-brakes working on small drums fixed at each end of the rear axle. A peculiar feature of the vehicle, and one which is, we think, rather a drawback, is that the whole of the transmission gear is open to view at the back, and in the front it is protected only by plaited cane work. At the same time the car is of an attractive appearance. One of the vehicles exhibited is arranged as a light parcel carrier, in addition to

FIG. 3.—THE DECAUVILLE VOITURETTE.

having accommodation for [two persons, while] another is arranged with an additional seat located over the motor and transmission gear at the rear.

Messrs. Friswell, Limited, of 18 Holborn Viaduct,

London, E.C., have a large exhibit of motor vehicles, and motor cycles. The former comprise cars of the well-known Mors, Benz, Hurtu, and Decauville types, and the latter are of Messrs. De Dion and Bouton's construction. One of the Benz cars on view is fitted with a detachable coupé body, of which Messrs. Friswell are making a speciality. Although the coupé presents a somewhat odd appearance, there is no doubt that for those who use their cars in all weathers it is a convenience. A novelty so far as this country is concerned

FIG. 4.—THE ELAN VOITURETTE.

is the "Elan" two-seated carriage, a French-built car of neat design (Fig. 4). The motor is of the vertical petroleum-spirit type; it comprises two cylinders, with electrical ignition, and is capable of working up to 3 h.p. (Fig. 5). For cooling purposes, radial discs to the cylinders are relied upon, aided by a small fan driven off the motor, which is located in the front portion of the car. As regards the transmission gear, in line with the motor-shaft, and connected with it by a friction-clutch

FIG. 5.—SECTION OF ELAN MOTOR.

working inside the fly-wheel, is a variable speed gear shaft, suitably enclosed. Four forward speeds—6, 12, 24, and 35 kilometres per hour—and one backward motion are provided, all controlled by a single lever within convenient reach of the driver. From the variable speed shaft the power is transmitted through bevel wheels to the differential shaft, and from the latter to the rear road wheels through the usual sprocket wheels and chains. Three brakes are provided, a

band brake on the differential shaft and shoe brakes on each of the rear road wheels. The wheels are of the tangent-spoke type, fitted with pneumatic tires, and running on ball bearings. The weight of the carriage complete is a little over 6 cwt. Messrs. Friswell, Limited, also exhibit a large range of accessories for motor-car users.

A vehicle which has come in for a large amount of attention during the week is the Jackson "Doctor's" car of the Yorkshire Motor-Car Co., Ltd., Albert Buildings, Bradford. As we illustrated and described this car in our last issue it is only necessary to briefly refer to it on the present occasion. We may remark, however, that closer acquaintance with it bears out the fact that the car is neatly and practically designed, the only drawback being, in our opinion, that it is safely underpowered. On this point, however, the makers assure us that the car has been driven up some very stiff gradients in Bradford at a fair rate; three forward speeds—4, 9, and 15 miles per hour—are provided, the transmission being by means of belt. These normally run slack, the tension being applied by jockey pulleys, controlled by three small handles at the side of the driver. Another feature of the vehicle is that the "body" can be readily detached from the frame, and a small box van to carry about 6 cwt., which the firm are making, can be fitted in its place.

Messrs. Marshall & Co., of Belsize Works, Clayton, Manchester, are present with a couple of their English-built "Hurtu" cars. As we illustrated and described this neat and elegant car so recently as our issue of the 9th inst., it is unnecessary to further refer to them on the present occasion, except to state that they have excited general admiration. Mr. Rush, of the London Autocar Co., was in charge of the exhibit.

Our Scottish correspondent, "Brown Heather," has kept our readers very well posted as to the progress made by Stirling's Motor Carriages, Ltd., of Hamilton, N.B. The present occasion is, however, the first time the writer has had an opportunity of inspecting a Scotch-built motor-car, and without undue flattery it may be safely stated that rarely, if ever, has he seen such high-class work as is to be found in the five Daimler cars exhibited by this Company. The motor and transmission mechanism of these vehicles is of the Daimler standard type, and needs no description at this time.

The "Hamilton" dog-cart, to seat four persons, is fitted with a 5½-h.p. Daimler motor. The body of the vehicle is of varnished walnut, while the under-carriage is painted umber, lined out in straw colour. The road wheels are fitted with 2½-in. solid rubber tires. The upholstering work is in morocco leather, the whole turn-out being of a handsome kind. The next vehicle is what is known as the Miniature Tourist Car. It is fitted with a 5½-h.p. Daimler motor, and arranged to seat four persons, there being a comfortable arm-chair front seat, and two seats at the back on wagonette principle, accommodating two persons. Accommodation for baggage is provided, while the car is furnished with extra storage tanks, so rendering the vehicle, as its name implies, particularly well adapted for touring purposes. We next inspected a motor mail-driving phaeton, which is also arranged to seat four persons. This car is painted olive green, with wheels and undercarriage in vermilion, and lined out in black. It is luxuriously upholstered in green morocco, and fitted with a portable folding enamel leather hood, and will, no doubt, appeal to a certain class of automobilists. Many attempts have at times been made to produce a motor-brougham, and the Stirling Company are to be congratulated on the handsome vehicle they have produced in the "Brandon" brougham they have on view. The entrance to the brougham is arranged at the front next to the driver's seat; provision is made for two inside passengers, although two folding seats for children are also provided. The interior of the vehicle is upholstered in old gold silk plush, the body is painted black and brown, the wheels and undercarriage being grey, lined out in old gold colour. The last of the Stirling-Daimler cars to be noticed is a family omnibus to

seat eight persons. The roof of this vehicle is made detachable so that it may be readily converted into an open wagonette. The motor is of  $5\frac{1}{2}$  h.p., of the standard type, the wheels being fitted with solid rubber tires. Altogether, these cars are excellent specimens of workmanship, and have been greatly admired during the past week.

Another section of Messrs. Stirling's exhibit which has come in for a large amount of attention is the Stirling-Pennington car, two of these vehicles—a Victoria de luxe, and a neat design of four-seated vehicle—are shown. The car body of the latter is varnished walnut and is upholstered in brown cloth to match. The Pennington motor is mounted under the floor of the vehicle, the fly-wheel being fixed horizontally. Some alteration in the driving gear appears to have been made since the writer last inspected a Pennington car—the motor driving a horizontal pulley at the rear by means of a light cycle chain, the pulley being now connected to the front wheel axle by a belt in place of a rope as formerly. The road wheels are of the suspension type, shod with pneumatic tires; the rear wheels are the steerers, and are controlled by a handle at the side of the car. All the parts of the car are made on the interchangeable system, so that in case of accident repairs can be speedily carried out. Another feature of the Pennington car is that no carburettor is employed in connection with the motor, the oil being fed directly into the explosion chamber, passing on its way through the exhaust silencer and so receiving a preliminary heating. Attention is also drawn to the small amount of cooling water required. The whole of the mechanism is well protected, so that it cannot be affected by wet or mud. Ample brake power is provided, there being two independent band brakes. By switching out the electrical current in connection with the ignition device the motor is made to also act as a brake, so that the car can be quickly brought to a standstill. Altogether the Pennington car is built on novel lines and is well worthy of close inspection. Those who have not been able to do so this week will have a further opportunity at the forthcoming show at the Agricultural Hall, where, in addition to a number of these little vehicles, the Pennington Co. will also have on view a new motor-bicycle.

Messrs. Roots & Venable, of 100 Westminster Bridge Road, London, S.E., display a light car designed to carry two persons at a maximum speed of twelve miles per hour on the level, with a slower speed for inclines. It is driven by a Roots' single-cylinder motor of 3 i.h.p., using ordinary paraffin or kerosene oil. There are two friction clutches, giving speeds of four and twelve miles per hour respectively, but any speed between one mile and the maximum can be obtained. Two independent brakes are provided. The cylinder is water-jacketed; the storage tanks having a sufficient capacity for oil and water for a journey of about five hours. The countershaft is chain driven, while the connection between the countershaft and the rear road axle is also by chain gearing. A feature of the Roots' car is the water condensing coil, which consists of a series of copper tubes fitted round the fly-wheel in such a way that the latter works within the coil. Messrs. Roots & Venable are also showing their light commercial van, designed to carry a load of about one ton. It is fitted with a  $6\frac{1}{2}$ -h.p. heavy oil-motor of the firm's design. The consumption of oil in this motor for an average run of fifty miles is about  $5\frac{1}{2}$  pints per hour; the cost of a fifty mile run being about 1s. 8d. In this vehicle two clutch-speeds forward, the one of three miles and the other of ten miles per hour, and one clutch-speed backward of three miles per hour, are provided; but as in other vehicles of this firm's manufacture, the van can be driven at any speed, by graduating the friction clutches, between one and ten miles an hour.

A car at the exhibition which comprises probably more novel points than any other is that exhibited by Mr. F. W. Lanchester, of 59 Lincoln's Inn, Corporation Street, Birmingham. We are only able to give but a brief account of the new car, which takes the form of a two-seated phaeton, as the whole of the motor and transmission gear is completely

boxed in, and therefore not open for inspection; Mr. Lanchester, too, has not been very accessible, having been busily engaged running his car all the week. We were, however, able to glean from him a few of the leading details. A striking feature of the car is that, notwithstanding the small seating capacity, the motor is capable of working up to 8 b.h.p. The motor, which is arranged at about the centre of the frame, under the seat, comprises two horizontal cylinders, 5 in. diameter by 5 in. stroke, facing each other in the same line. Two connecting rods are attached to each piston. There are two cranks independent of each other, and two fly-wheels also independent of each other but keyed respectively to the two crank shafts, one of which is 3 in. above the centre line of the engine, the other 3 in. below it. One connecting rod from each piston goes to the upper crank pin and one to the lower, a kind of diamond-shaped linkage when the pistons are at mid stroke being thus formed. It may also be stated that the two crank shafts revolve in opposite directions, while to counteract any vibration balance-weights are attached to the connections of the crank webs. Another feature of the motor is that no water-jacket is employed for cooling purposes, this being replaced by an air-jacket, the details of which have not been made known. The ignition is electrical, an ingenious magneto-electric device being employed, the rim of the fly-wheel being utilised to carry or form a permanent magnet, which, in revolving, produces an electrical current in a small armature geared near it. A hit-and-miss governor is fitted to the motor, and by means of small levers within convenient reach of the driver's hand the rate of sparking can be advanced or retarded as desired. Another feature of the Lanchester motor-carriage is to be found in the transmission gear. The motor drives a friction disc, against which a plate is held by depressing a lever; this plate is keyed to a shaft carrying a worm, which gears with a large worm wheel, inside which is mounted the differential gear on the rear road-wheel axle. When the worm shaft disc is pressed against the motor disc the worm rotates normally at the same speed as the motor; when the disc is drawn back it is forced against fixed stops, which act as a powerful brake. The steering is effected by a lever, fixed outside the car body, operated by the right hand of the driver, the wheels being mounted on independent axles, and coupled by a new design of compensating gear. The "body" is designed separately from, and is admirably supported by springs on the tubular frame of, the vehicle, so that different types of body can be fitted to the same frame. The road wheels are of the suspension type, with pneumatic tires, the rear pair being provided with shoe brakes.

La Société Française d'Automobiles, Quai National Puteaux, France, shows for the first time in England a motor-tricycle and a quadricycle to seat two persons. The feature of these vehicles is the Gaillardet motor with which they are fitted. It is of the single-cylinder vertical petroleum-spirit type and is claimed to develop  $2\frac{1}{2}$  h.p. The crank shaft operates a disc forming the fly-wheel, upon the shaft of which is a pinion. The inlet and exhaust valves are so arranged that by removing one bolt they can be instantly taken out for cleaning purposes, etc. The ignition is electrical, while the cylinder and valve chambers are cooled by radial discs, these being larger than usual and extending to the top of the explosion chamber. The carburettor is composed of a brass box of a capacity of three litres, and filled through the tube at the side, so placed as to indicate the maximum level. An air inlet at the top is so devised that its inner orifice can be adjusted to the level of the liquid, being lowered and raised as required. Another valve at the top regulates both the vapour and the air, in one of its extreme positions, shutting off the vapour entirely and admitting only air, in the opposite extreme shutting off the air entirely and admitting only vapour. A further valve regulates the supply of explosive mixture to the motor. The mixture is given a slight preliminary heating, the exhaust pipe being carried through the bottom of the carburetting device. The motor in the tricycle drives direct on to the rear axle. In the case of the quadri-

cycle, however, a variable two-speed gear is provided, while provision is also made whereby the motor can be entirely cut off from the transmission gear.

The Ariel Cycle Company, Limited, Birmingham, exhibit their Ariel motor tricycle, which is fitted with a  $1\frac{1}{4}$ -h.p. motor of the De Dion type. A feature of this machine is that the motor, instead of being placed behind the axle, as is usually the case, is placed between the chain stays. By this arrangement the motor is carried in front of the axle, the claim being that the weight is within the wheel base, and the front wheel takes its share of the load, thus making the steering far more accurate.

For vehicles of novel design the exhibit of the Motor-Carriage Supply Co., Ltd., of Donington House, Norfolk Street, London, W.C., is one to which the visitor to the Exhibition is quickly allured. Two German-built Daimler motor-lorries occupy a large amount of space on the stand. Although presenting anything but an attractive appearance, they have shown themselves capable of performing the work for which they were designed. One is fitted with an  $11\frac{1}{2}$ -a.h.p. Daimler motor and Daimler transmission gear, and is intended for loads of from  $3\frac{1}{2}$  to 5 tons. Four speeds forward are provided, ranging from  $1\frac{1}{4}$  to 6 miles per hour. The second lorry is of the same type, but intended for a load of only  $1\frac{1}{2}$  to 2 tons; the motor is of  $7\frac{1}{2}$  a.h.p., and the speeds range from 2 to 8 miles per hour. A Cannstatt-Daimler wagonette is the next vehicle which calls for mention; the car is fitted with a  $5\frac{1}{2}$ -h.p. motor, and four speeds ranging up to a maximum of sixteen miles per hour. The car possesses several novel features, the most important of which is the method of fixing the motor, which, together with the speed-gear, is mounted upon a separate tubular frame, so as to greatly minimise the vibration imparted to the main frame and body of the car. Another point worthy of notice is the means employed for reducing the quantity of water required for cooling purposes, which is effected by a new water-cooling apparatus, consisting of a reservoir containing only  $2\frac{1}{2}$  gallons of water, placed in front of the car. The tank is closely packed with small tubes, round which the cooling water circulates. A current of air is drawn through the tubes by means of a fan on the crank shaft of the motor, thus effectually preventing the circulating water from becoming overheated. The arrangement of the speed gear is also new. The four speeds are divided into pairs, each pair being placed into or out of gear by a separate lever, and is so arranged that while one speed is in gear it is impossible to move the other pair, the lever for that being locked. The foot brake lever, as well as applying the brake, actuates the clutch on the main shaft, thus throwing the friction cone out of gear, and applying the brake with one movement only. The body of the car has been built in this country by Messrs. Mulliner, of Northampton.

The Motor-Car Supply Co. also exhibit their "motor-wheel," a three-wheel vehicle, their motor-scout for military purposes, their "Prince Albert" two-seated four-wheeled carriage, Simms' petroleum-spirit motor of  $1\frac{1}{2}$  h.p. (the feature of which is the large *ailettes* or radial cooling discs), their magneto-electric ignition device—which pressure on our space prevents us dealing with at length this week.

The Accles-Turrell Motor Co., of Holford Works, Perry Bar, Birmingham, display a new petroleum-spirit motor of  $1\frac{1}{2}$  h.p., one of the features of which are the radiating fins; these consist of thin steel discs, much more numerous and larger than is usually employed. The cylinder barrel and combustion chamber are also formed in one piece, so avoiding a top joint. The Company also exhibit their special form of carburettor and automatic oil feed, as also a motor-tricycle fitted with the Accles motor. According to the catalogue, the Company also intended to exhibit their new two-seated light motor-car, with 3-h.p. water-jacketed motor, but up to the time of writing this report the car had not put in an appearance.

Mr. J. H. H. Berkeley shows a one-seated electric carriage, which takes the form of a bath chair, the motor being

enclosed in a case at the rear. The little vehicle appears to be easily controlled, but at the time of our representative's visit there was no one present to afford information as to its capacity.

Another motor-bath-chair is that which is exhibited by the Rover Cycle Co., Ltd., of Coventry. In this case the vehicle is propelled by means of a De Dion motor of  $1\frac{1}{2}$  h.p. arranged at the rear, above which is a saddle for the driver. The motor is connected to a small counter-shaft by chain gear, the latter being also employed from the intermediary shaft to the rear axle.

The exhibit of Messrs. Lyon & Whitmore, of 13 Downing Street, Cambridge, although but small, is one that is full of interest to users of petroleum-spirit motor-vehicles, especially those fitted with tube ignition to the motors. The device shown is a lampless and wickless ignition tube; the vapour for the burner is conveyed under pressure through a small platinum tube, the end of which is made up of an irregular coil of platinum wire. This is located right inside the ordinary platinum ignition tube; to start it it is only necessary to withdraw the new burner and light it with a match, afterwards replacing it in the tube. The device has been in use for over three months on a Daimler car, and is stated to have given very satisfactory results. Another interesting exhibit at this stand is an automatic extinguisher, by means of which, should the car be accidentally overturned, the supply of oil to the lamps is automatically cut off, thus obviating all danger of fire, etc. The device consists of a heavy brass ball attached to the burner admission cock; this ball is carried on a ring in such a way that it falls therefrom should the car tip over in any way.

However divided opinions may be as to the relative progress being made by builders of light motor-vehicles in this country as compared with Continental competitors, there can be no doubt that in one department at least—that of heavy steam-driven cars—English firms are rapidly taking the lead. If any proof of this fact be needed it is to be found in the large steam 'bus exhibited by the Liquid Fuel Engineering Company, of East Cowes, Isle of Wight. It is unnecessary to enter into a lengthy description of the boiler, engine, and transmission gear of this vehicle, which are now fairly well known and which were described at length in *Industries and Iron*, November 25th, 1898. Suffice it to say that the boiler is of the water-tube type, is oil-fired, and is located in the fore part of the vehicle. The engines are of the horizontal compound reversing type of 45 h.p. The power of the motor is transmitted to the differential counter-shaft by bevel gearing. The latter shaft carries small pinions at each end, engaging with large internally-toothed rings bolted to the rear wheels. The 'bus, which is finished in handsome style, is arranged to accommodate twenty-eight passengers, twelve on top and sixteen inside. The interior is divided into two separate compartments, first and third class, with different entrances. Baggage to the extent of 10 cwt. can also be carried on the roof. Tanks for containing about eighty-eight gallons of water are arranged under the seats, while about forty-six gallons of oil for firing purposes can be stored in tanks arranged on the frame, under the floor of the 'bus. The vehicle is, we understand, one of an order for four, and intended for a French company for service between Hyères and Toulon. The Liquid Fuel Co. also exhibit several of their shielded rubber-tired wheels for heavy vehicles. The wheel has a steel tire, above which is a layer of rubber, above which again is a steel rim built up in separate segments; the makers claiming that the arrangement reduces vibration, and also the tendency to slipping and skidding.

The Steam Carriage and Wagon Co., Ltd., of Homefield, Chiswick, London, W., exhibit a couple of steam wagons built on Thornycroft's system. The first is a steam dray built to the order of Messrs. Fuller & Co., brewers, Chiswick, and intended to carry a load of three tons, at the same time being capable of hauling a load of two tons on a trailing vehicle. The boiler, which is of

the Thornycroft water-tube type, is located in the fore part of the vehicle; it is coal-fired, although it can be adapted for liquid fuel firing if desired. The heating surface is 65 square feet, the grate area  $2\frac{1}{2}$  square feet, the test pressure 350 lb. per square inch, and the working pressure 180 lb. The engine, which is of the horizontal compound type, is entirely enclosed in a dust-tight casing, the moving parts working in an oil bath. In this vehicle the power is transmitted from the counter-shaft, fitted with a two-speed gear by chain gearing to the rear road-wheel axle. The vehicle is entirely controlled from the driver's seat. Provision is made for the carrying of coal sufficient for a run of fifty miles, or of water sufficient for about fifteen miles. This Company also exhibits a steam lorry (Fig. 6), which, in the driving gear presents many changes from the type which has hitherto been adopted. The tare weight of the vehicle is 2 tons 18 cwt., and is intended to carry a load of three tons, and to have a load of two tons on a hauling vehicle. The boiler and engine are of the same type as above alluded to, the motor being of 14 h.p. As regards the new power transmission mechanism, we regret we are unable to give but few particulars. From a cursory inspection, however, we gathered that the rear axle, which is a compound one, is driven by spur wheels. The rear road-wheels are mounted loosely on the solid axle and are driven

20 h.p., the normal speed being 500 revolutions per minute. The shaft of the motor extends from the front right to the rear of the car, where the power is transmitted through bevel gearing to an intermediary shaft. The latter carries at its ends small pinions, which gear with internally-toothed rings bolted to the rear road wheels. A variable speed gear is provided, and it is stated that the lorry can attain any desired speed from two to seven miles per hour. The road wheels are strongly built and dished. Ample brake-power is provided, there being a shoe brake acting on the fly-wheel of the motor, and band brakes on each of the internally-toothed rings connected to the rear road-wheels.

Another interesting exhibit of steam-driven vehicles is that of the Clarkson & Capel Steam Car Syndicate, Limited, of Deverell Street, Great Dover Street, London, S.E., which is showing a steam landau to carry six, a two-seated Victoria with accommodation for luggage or two extra passengers, and a steam lorry to carry from four to five tons. Dealing first with the landau (Fig. 7), this is of very novel appearance, and has been designed to secure the utmost possible comfort to the passengers. The body is suspended by C-springs on an underframe that carries all the machinery. The underframe is constructed of steel channels, bent to elliptic curves. All the propelling machinery is placed in the rear of the underframe. The position of the driver's seat is also placed behind,

FIG. 6.—THE THORNYCROFT STEAM LORRY.

through the medium of elliptical springs attached both to the hubs of the wheels and to the hollow axle surrounding the solid one. A two-speed gear is provided, with the low one of which it is stated that a gradient of 1 in 6 has been climbed. At the recent trials this vehicle maintained an average speed of 5.4 miles per hour, over a twenty-miles course, at an average expenditure for fuel of 1.055d. per mile.

Messrs. Bayleys, Ltd., of Newington Causeway, Southwark, S.E., exhibit the steam trolley or lorry which took part in the recent trials. This vehicle is a veritable combination of parts, comprising a De Dion water-tube boiler, a Straker motor, and a transmission mechanism very similar to that employed on the Daimler petroleum-spirit cars. The vehicle is stated to weigh, unladen, 58 cwt. and to be designed to carry a load of four tons. The De Dion boiler, which is coke-fired, consists of a circular water-casing made up of the outer shell and cylindrical-fire box; in the centre of the fire-box space, about a foot above the bars and extending nearly a foot above the top of the boiler, there is a central chamber, the upper part of which forms a steam dome. Connection between this dome and the outer water shell is made by a series of short, straight, radial, upwardly-inclined tubes, the upper rows of which form super-heating tubes. The engine, which is of the vertical compound type, is arranged under the driver's seat; it is stated to indicate

the driver being thus in more direct communication with the machinery, enabling the front portion of the car to be utilized for the condenser, and giving the passengers an unobstructed view. Clarkson's system of oil firing (common paraffin) is used. The steam generator is of a modified Thornycroft type, and supplies steam at 200 lb. per square inch. It is fitted with a reciprocating float gear, which keeps the water-level constant and dispenses with glass water-gauges. The engine is of the compound enclosed self-lubricating type, similar to the one on the lorry referred to before, and develops up to 17 i.h.p. The power is transmitted by Renold's chain to a counter-shaft fitted with balance gear, and a two-speed friction clutch, giving seven and fifteen miles per hour, is operated by a single lever. The steam regulating valve is of a four-ported design, and enables a steam brake to be operated by a backward movement of the driving lever. There is also a foot lever actuating a pair of semi-band brakes. The steering is effected through a quadruple-threaded screw mounted upon the front axle, which locks the steering wheels in all positions, enabling the hand to be removed from the controlling wheel without any risk. The fuel and water tanks contain sufficient for a run of 100 miles. The weight of the landau in running order is about 30 cwt.

The two-seated steam Victoria (Fig. 8) is a converted horse-

drawn vehicle, fitted with wood wheels, 2½-in. Dunlop pneumatic tires. The steam generator is of the semi-flash type, and is constructed entirely of coiled tubes; it is located at the rear, and is fired by paraffin on Clarkson's system, and supplies

from its normal "steam off" position, so that the use of a second lever is unnecessary. The water supply to the boiler is automatically controlled by Clarkson & Capel's reciprocating float gear, and renders the boiler practically independent of the driver's attention. The oil fuel is consumed on Clarkson's system, and is automatically regulated according to steam pressure. The exhaust steam is condensed by the atmosphere acting upon wire covered copper tubes fitted into the roof of the cab over the driver, under which is located a large horizontal fan, driven by a rope off the motor. This condenser does away with the necessity for carrying a large supply of water, and secures the advantage of supplying the boiler with clean distilled water that keeps the interior of the boiler free from deposit, and thus does away with the necessity for frequent cleanings. The lorry is provided with a two-speed gear, giving six miles per hour on the level and two miles uphill.

FIG. 7. THE CLARKSON-CAPEL STEAM LANDAU.

steam to a twin-cylinder double-acting enclosed type engine of 4 h.p. that works at any speed up to 2,000 revolutions per minute. Only one gear is used, the power and speed being regulated solely by the steam throttle. In the front of the car is fixed one of the firm's air condensers, which is assisted by tubular wings over the front wheels. The fuel and reserve water tanks contain sufficient for a fifty-mile run, and the pressure gauges, as well as fuel and water quantity indicators, are placed conveniently in view of the driver. Two powerful band brakes acting upon the driving wheels are operated by a foot lever. The motor transmits its power to a counter-shaft by a Renold silent chain, while pinions on the end of the counter-shaft gear with internally-toothed rings bolted to the rear road wheels. The weight of the car complete is 12 cwt.

The Clarkson-Capel steam lorry is designed to carry four to five tons, and weighs unloaded fifty-eight cwt. It is propelled by an oil-fired vertical boiler that supplies steam at 200 lb. per square inch to a compound enclosed self-lubricating engine of 17 h.p., constructed largely of aluminium, located in the fore part of the vehicle. The power is transmitted ordinarily through Renold's chain gearing, both from the motor-shaft to the counter-shaft and from the latter to the rear road-wheel axle, but for emergencies and hill work a low gear of treble power is brought into operation by depressing a foot brake lever to its lowest point, where it is locked by a lateral movement, and at the same time releasing the ordinary friction clutch. A steam brake is arranged to come on by a further movement of the steam regulator lever

Messrs. Des Vignes, Cloud & Co., of Strand-on-the-Green, Chiswick, S.W., have an exhibit of special interest to those whose tendency is in favour of steam motor-vehicles, this firm making a speciality of boilers and engines for this type of car. Four boilers are exhibited—a 7-h.p. water-tube type, weighing 204 lb.; an 8-h.p. semi-water tube, weighing 270 lb.; a 7-h.p. fire-tube type, whose weight is 3¼ cwt., and another of the same type of 4 h.p., and weighing 2 cwt. Of small steam engines, a well-finished 3-inch set of

FIG. 8. THE CLARKSON-CAPEL STEAM VICTORIA.

the two-cylinder vertical type is shown, as also a small high-speed horizontal motor.

Considerable interest has been displayed during the week in the accumulator shown by the Crowds Accumulator

Syndicate, Ltd., of Bridge Place, Eccleston Square, London, S.W., this no doubt being due to the claim made for the accumulator that it has a capacity of 10 Watt-hours per lb. of cell. The sheet lead used for the grids is of a specially pure quality, containing no antimony. It is passed through a press and cut and stamped to shape, the resulting grid having the appearance of expanded metal. The grid so obtained is very light, and bends under its own weight, the idea of this being that it is considered there is no advantage in making the grids so strong as to last longer than the active material they are incorporated with. The grids are afterwards pickled in caustic soda, and finally rinsed in dilute sulphuric acid. They are then weighed, the lighter ones being used as negatives and the heavy ones as positives. The grids are next pasted with a simple mixture of red lead or minium in such a way that the active material cannot disintegrate. After pasting, the grids are soldered to a back plate made of lead antimony, and upon the upper part of which is a lug terminating in a screw, which forms one pole of the element. The positive and negative groups are each placed within lead dummies, and subjected to the passage of the current in the usual way; the positive plates being converted into spongy lead, and finally into peroxide, while the negative plates are converted into spongy lead. In assembling an element each plate is wrapped in a sheet of absorbent pulp or cellulose, and separators of perforated insulating material are then placed between each positive and negative plate. The whole is then placed within an ebonite box and the electrolyte added. The cellulose wrappers absorb the liquid, causing the former to swell, with the result that the plates are firmly held within the cell, and all chance of the active material washing away from the plates prevented. The cell is fitted with a light-fitting rubber cover through which the poles project, and in the middle of the cover is a screwed cap for examination and filling. Connection between adjacent cells is made by a flexible stranded copper wire having brass collars and well insulated. The accumulator is being made in a number of sizes ranging from 100 ampère-hour up to 240 ampère-hour capacity. The following are the details of the 100 ampère-hour cell, the internal resistance of which is given as .008 ohm. Dimensions of box outside,  $5\frac{3}{8}$  in. by  $3\frac{7}{8}$  in. by  $8\frac{1}{2}$  in.; total weight of complete cell, 14 lb.; height over all,  $9\frac{1}{4}$  in.; available capacity at 10 ampères, 100 ampère-hours; 15 ampères, 90 ampère-hours; 20 ampères, 85 ampère-hours. We understand that the Crowds cell has already been adopted by a number of electrical motor-car builders in this country, including the Electric Motive Power Company, the Electric Street Car Manufacturing Syndicate, and the Madelvic Company.

The Electrical Undertakings, Ltd., of Miller Street, High Street, Camden Town, N.W., are attracting attention by their exhibit of a new type of electrical vehicle, which

is built on Leitner's system. Two vehicles are shown, a four-seated sporting trap and a two-seated buggy. An illustration of the latter is given in Fig. 9. Two electro-motors, of the Lundell type, and of  $2\frac{1}{2}$ -h.p. each, are provided—one to each of the rear road wheels—the connection being by means of spur-wheels on the motor shafts gearing with internally-toothed rings on the rear road wheels. The battery consists of 40 Leitner-type accumulators, the capacity and weight of which are given as respectively 120 ampère-hours and 5 cwt. The controller is adapted to give no less than six forward speeds, ranging from two to twenty-eight miles per hour and two backward motions. The motor is so arranged that in descending hills it can be reversed and employed in recharging the batteries. The weight of the car complete is 16 cwt. 28 lb., the capacity of the battery being stated to be sufficient for a run on ordinary roads of seventy miles with one charge. The

FIG. 9.—THE ELECTRICAL UNDERTAKING'S, LTD., BUGGY.

Company is manufacturing its own accumulators, and is also arranging to construct its own electro-motors. We also understand that the construction of a twelve-seated electrical vehicle, to be known as the "Tally Ho," is at present in hand.

The Mackenzie Carriage Works, of 26 Walnut Tree Walk, Kennington Road, Lambeth, S.E., exhibit three electrical cars—a Riker two-seated mail phaeton, a Mackenzie four-seated sporting dog-cart, and a Mackenzie phaeton. The frame of the Riker car is built up of steel tubing. The electro-motor is of  $1\frac{1}{2}$  h.p.; it is arranged in front of the rear axle, which it drives by means of spur gearing. The electrical energy is furnished by a battery of forty Headland accumulators of a capacity of 90 ampère-hours. The wheels are of the suspension type fitted with pneumatic tires, the weight of the car complete being  $18\frac{3}{4}$  cwt. Three forward and two backward speeds are provided. The Mackenzie dog-cart is built very much on Riker lines, but shows a number of detail improvements both in the carriage body design and in the mechanical arrangement. The frame is tubular, the connecting rods controlling the steering of the front wheels being of an improved design. The electro-motor, which in

FIG. 10.—THE ELECTRIC MOTIVE POWER CO.'S DOG-CART.

this case is of 3 h.p., is geared by means of spur wheels to the rear axle, a band brake operated by a foot pedal being incorporated with the spur wheel on the latter. The battery consists of forty cells of the "Victoria" type, of a capacity of 150 ampère-hours, or sufficient for, it is claimed, a run of sixty miles on one charge, the weight of the battery being 10 cwt. Three forward speeds—the maximum being twelve miles per hour—are provided, these being controlled by a single handle. From our own experience we can safely state that the steering and control of this vehicle is of the most simple and easy character. Among the little "tricks" in this car is the fixing of a push-button switch in the steering-bar handle so that the alarm gong may be sounded without removing the hand from the bar, while another is the arranging of the battery chest in such a way that not only the sides but also the top of the accumulators may be quickly rendered accessible. The weight of this car complete is 23 cwt. The Mackenzie phaeton is of a very neat design, the electrical gear being the same type as the dog-cart with the exception that the motor is only of  $1\frac{1}{2}$  h.p.

Headland's Patent Electric Storage Battery Co., Ltd., of 12 Pall Mall, London, S.W., exhibit no less than four different electric vehicles, the leading feature of all of which is the Headland accumulator, which is claimed to be constructed with a view of giving great mechanical strength, at the same time permitting of high rates of discharge and securing freedom from buckling and disintegrating of paste. The vehicles shown are:—a converted horse-drawn mail phaeton, a three-seated phaeton, a two-seated phaeton, and a four-seated Victoria. The first-named has a 3-h.p. motor, driving the rear axle by bevel gearing. Three speeds are provided for—3, 7, and 14 miles an hour. They are obtained by grouping the forty cells of the battery, which has a capacity of 150 ampère-hours, in the parallel-series method. The carriage has a travelling capacity of about thirty-five miles with one charge. The battery which is in

the car has worked it from the beginning, nearly two years ago, and is still in excellent condition. In the three-seated phaeton a 3-h.p. motor is provided, connecting on to the front axle by worm gearing. The weight of the car complete is 24 cwt. In the two-seated phaeton the motor is connected to the front axle by chains of the Renold-laminated type. The battery comprises forty cells of a capacity of 140 ampère-hours. Three forward speeds and one astern are provided, while in addition to the electrical brake, band brakes on the rear-wheel hubs are fitted. The road wheels are of the suspension tangent-spoke type, with  $1\frac{1}{2}$ -in. solid rubber tires. The four-seated Victoria is similar to the other vehicles as regards the electrical arrangement, with the exception that the motor is geared to the front road wheels by pinions engaging with internally-toothed rings bolted to the wheels.

Another interesting exhibit of electric motor-vehicles is that of the Electric Motive Power Company, Limited, 74 Caistor Road, Balham, S.W. The first car to attract our attention was a very elegant four-wheeled dog-cart (Fig. 10), having four seats, the body being of light varnished wood. The driving is effected through an enclosed 5 h.p. electro-motor of the Mackey type, current to which is supplied by sixty-two Crowds cells, each weighing 24 lb., and having a capacity at a four-hours discharge of 264 Watt-hours. The whole battery complete weighs, therefore, 13.25 cwt., and has a capacity of 22 h.p. hours. The motor is geared to the rear axle through spur gearing. There are four speeds of 3, 6, 9, and 12 miles per hour respectively, obtained by paralleling the cells in a special controller, by means of which the speeds may be varied without breaking circuit, thus, it is claimed, obviating wear and tear due to sparking; an average run of fifty miles with one charge being obtained with a full complement of passengers. Three brakes are supplied—(1) an automatic electric brake, operating to charge the cells, this being the one used under ordinary conditions; (2) a rim

brake, engaging on aluminium plates on the driving wheels; (3) a hand brake on the live axle working in both directions. Another novel feature is an arrangement whereby, in actuating the foot brake, the electric controller is returned to zero before the brake proper can be applied. Two electric carriage lamps are provided, and the alarm is given by an electric gong, actuated by a press button in the steering handle. The frame of the car, which weighs complete under 23 cwt., is built up of steel tubing.

The Company also exhibit a four-wheel phaeton, the details of which, so far as the driving mechanism is concerned, is identical with the car above described. Another interesting and somewhat novel form of vehicle shown by this Company is a two-seated, three-wheeled electric carriage, having a varnished walnut wood body, the total weight, with two passengers, being under 8 cwt. It is propelled by one motor of 2 h.p., the current to which is supplied by twenty-two Crowds cells of 14 lb. weight each, the battery complete weighing 2.75 cwt. An average run of thirty-five miles can, the makers state, be relied on at a speed of twelve miles per hour, which can be varied from that to zero. The steering and control are effected by one lever connected to the front steering wheel. The motor drives the rear wheels, which are fixed to a live axle, through an enclosed single reduction bevel gearing and differential box. The driving wheels, which have a diameter of 26 in., are fitted with pneumatic tires. The frame is built up of steel tubes, giving great strength with lightness. Three brakes are provided—(1) an electric brake, this being the one commonly used, and two band brakes, each acting separately on the live axle. The weight complete of this little car, with motor and cells, is under 5½ cwt.

The Electric Motive Power Co. are also exhibiting a 3½-h.p. vertical double-cylinder heavy oil motor, built in accordance with New's patents, for which the Company are the sole licencees as regards motor-vehicles. There are many features of interest about this motor, one of which is to be found in the special inlet valve, which obviates the necessity of providing any sort of vaporiser or heating device, and by which the velocity of the incoming mixture can be varied to facilitate starting, etc.; a special electric timed-firer is also provided, which, after the engine has once begun running, can be switched off, the device becoming self-firing. The point of ignition by this arrangement is capable of being varied to suit the speed, in this case automatically. A great feature claimed for this device is that back-firing can never take place, as the heated tube is only exposed to the gaseous mixture by the opening and closing of a small shutter at that point during the compression stroke which will enable combustion to take place at the theoretically correct moment for all speeds, which can range from 200 to 1,200 revolutions per minute. The valves are all controlled by a cam shaft, fixed on the cylinder top, and driven by chain gearing from the motor shaft. A governor is provided, which controls both the igniter and the amount of mixture allowed to pass to the explosion chamber. The supply of oil to the latter is maintained by a small pump.

Messrs. Shippey Bros., Ltd., of 13 and 14 Cheapside, London, E.C., make a large display of motor and electrical accessories of all kinds for electrical motor-vehicles, chief among which is a 2-kilowatt 80-volt electro-motor with fixed carbon brushes as used in automobile vehicles on the Riker system, and a 3-h.p. 75-volt four-pole motor similar to those used by the Pope Manufacturing Co. Other exhibits comprise a Riker standard controller-switch giving three forward-speed and two reverse motions, Woodward's and Victoria accumulators, a spark coil battery, switches and cut-outs for motor-cars, ventilating fan sets, gongs, bells, etc., all of interest to builders and users of electrical cars, but to which pressure on our space forbids a lengthy reference at the present time.

Mr. Carl Oppermann, of 2 Wynyatt Street, Clerkenwell, E.C., was, according to the catalogue, to have exhibited half a dozen electrical vehicles built in accordance with his

designs, but up to Wednesday night they had not put in an appearance.

A new variable speed-gear for motor-cars forms the exhibit of Mr. W. H. Newman, c/o Mr. P. Hooker, Pear Tree Court, Farringdon Road, London, E.C. The device is intended to be arranged on an intermediary shaft; it is not a change speed-gear in the sense that certain pairs of wheels are disengaged while another pair is brought into gear; it comprises a box containing three pinions all in gear with a small pinion on the end of the hollow shaft carrying the driven pulley. The three pinions are all mounted very much on the lines of the "free wheels" at present being used on bicycles, *i.e.*, with cam roller clutches. The three pinions, although running free, are all continuously in gear with the driven pinion, the clutches being brought into action, one after the other without interval, as the controlling hand-wheel and screw-gear is advanced. The model shown at the Exhibition has only been made for purposes of demonstration; for motor-car purposes the clutches would be controlled by a hand lever, so that all of them, and consequently the driven pulley, could be instantly put out of gear in case of necessity. The model shown is arranged to give any desired speed to the driven pulley from nil up to a maximum of three-fourths of the speed of the driver; this can, of course, be varied to suit different requirements. The gear occupies but very little space, and appears to work very quietly.

An interesting exhibit to the motor-car engineer is Humpage's speed-reducing gear, which is shown by Messrs. J. C. Howell, Ltd., of 24 Queen Victoria Street, London, E.C. The gear, which is of the epicyclic type and is exceedingly compact, is enclosed in a light and small case, the model shown comprising an electro-motor running at 1,500 revolutions per minute, and at the other end of the shaft a small pulley whose speed is only fifteen revolutions per minute, the reduction being obtained by means of the reducing gear arranged between. Among the advantages claimed for this gearing are the following: The whole of the gearing is cased in and protected from dirt and dust, and, the wheels continually running in an oil bath, perfect lubrication is ensured and friction and wear are very much reduced. Owing to the balanced double drive all side strain on the driven shaft is avoided, there being no tendency to bend. The strain on individual teeth is also much reduced, as, owing to the flat bevel of the wheels, more teeth are in gear at one time than with spur gear. The ratio of reduction in the gearing can be varied to a large extent without materially altering the wheels themselves. In fact, any ratio of reduction that may be desired for any commercial purpose can, the makers claim, easily be obtained in a very compact space. Easy starting and stopping is secured by means of a brake band and handle, and the load can be brought on the motor with any degree of gentleness that may be desired.

The Mossberg Roller Bearings, Ltd., of 6 Victoria Street, Westminster, and Birmingham, have an interesting exhibit of their roller bearings for which many claims, which can be fully justified, are made in the way of reducing friction, etc. The rollers are made of hardened and ground tool-steel, and, while held in a bronze cage, are free to rotate on a tool-steel shell, generally fitted round the shaft or axle. A number of applications of the roller bearings are shown, including one to a brougham axle and wheels. There can be no doubt as to the practicability and utility of roller bearings for motor-cars, particularly those of the heavier class.

The Roller Bearings Company, Limited, of 1 Delahay Street, Westminster, S.W., is another concern exhibiting roller bearings, which are intended for application, not only on motor-vehicles, but also for railway and tramway rolling stock and heavy engines and machinery generally. It is almost unnecessary to remark that the bearings are composed of a series of rollers placed between the journal of the axle and the casing or box. The outer casing is of cast iron, into which is fitted a steel liner. The external form of this casing can be made to suit any special requirements of hub, framing,

etc. The rollers are made of hard steel, and are kept in position by a gunmetal cage made in one piece. This cage runs upon the axle, but does not take any part of the load, its function being to keep the rollers in their proper relative positions, and to prevent them from cross-winding on the axle. The bearings have already been adopted on a number of motor-vehicles with successful results, while as regards rolling stock, shafting, and heavy machinery, roller bearings have become almost a *sine quâ non*.

An exhibit which appeals more to motor-car builders than to users of automobile vehicles is that of Messrs. Rubery & Co., of Darlaston, South Staffordshire. It comprises a motor-car frame built up entirely of channel-section steel; it is adapted for a two-seated car, and weighs only 1 cwt. The firm claim that channel-section steel affords not only a light and rigid frame, but one of great strength. Examples of the various shapes in which channel-sections can be supplied are also on view, and it only needs a few minutes' conversation with the firm's representative to ascertain the fact that Messrs. Rubery are devoting considerable attention to the matter of frames for motor-car builders.

Messrs. Carless, Capel & Leonard, of Hackney Wick, N.E., it is almost needless to remark, are present with an exhibit of their well-known petrol for petroleum-spirit motors, also samples of petroleum oils for lighting and heating, etc., and lubricating oils of all kinds.

Another exhibitor in this class is the Anglo-American Oil Co., Ltd., of 22 Billiter Street, London, E.C., who, in addition to exhibiting samples of Pratt's well-known and largely used motor-car spirit, have also on view a number of petrol storage tanks, barrels, etc. The Company's new departure in putting up their spirit in small-sized and airtight cans seems to be greatly appreciated, and later on, when the system becomes known, it will be looked upon as a boon by owners of motor-cars.

The Dunlop Pneumatic Tyre Co., Ltd., of London and Coventry, are present with an exhibit of their well-known wired-on pneumatic tires. These are shown in several sizes suitable for motor-tricycles, light voiturettes, and heavy motor-cars.

Another concern which is now catering for the demand for pneumatic tires for automobile vehicles is the Clipper Pneumatic Tyre Co., Ltd., of Aston Cross, Birmingham. The "Clipper" tire, which is now being made in several sizes, suitable for motor-tricycles and all types of motor-cars, differs from the Dunlop in that it is not held on the rims by means of wires, the latter being replaced by the thickened edges with which the outer covers are provided, the tires being further attached to the rims by means of bolts.

The Grappler Tyre Co., Ltd., of 164 Corporation Street, Birmingham, have also a display of their pneumatic tires for motor-cars and cycles, together with a number of wheels fitted with the same.

The Shrewsbury and Talbot Cab and Noiseless Tyre Co., Ltd., of 24 Page Street, Westminster, have an exhibit of their solid rubber tires and steel rims for motor-vehicles. The tires are made in different forms—for vehicles weighing unladen up to two tons, and ditto up to one ton. A feature of the tire is that it is not only held fast by the rim itself, but two special wires are embedded in the rubber the whole way round, and so fastened that the makers claim that the rubber tire cannot "creep" or be pulled out of the rim even under the heaviest loads.

The feature of the solid rubber vehicle tires exhibited by the Sirdar Rubber Company, Limited, of 36 Duke Street, London, E.C., is that it consists of an endless compressed band moulded in a coil form, so that the tendency of the tire is to hold itself on the rim without the use of wires. A light strip of fabric is embedded in the base of the tire to prevent stretching. Another feature claimed for this tire is that it is put on the rim under compression, so that any slight cuts on the tire automatically close up.

Another solid-rubber tire for motor-vehicles is that which is shown by the Pendleton Rubber Co., Ltd., of 63 Frederick

Street, Edinburgh, and known as the "Woodlock." The steel rim is of C section, the rubber tire being held therein by special springs introduced at short intervals. No compression whatever is put on the rubber, and its whole resiliency is, it is claimed, retained, the attachment depending entirely upon the steel springs. These are fixed in the rim by a simple appliance, and once there it is impossible for them to become detached accidentally. These springs are also claimed to entirely prevent slipping or "creeping" in the rim. The arrangement admits of the rubber being packed on the rim, with the result that any accidental cuts on the surface of the tire close automatically, the makers stating that it is possible to replace even the smallest section of the tire that may have become injured or worn.

Messrs. Simms & Co., Amberley House, 12 Norfolk Street, London, W.C., show their special compound pneumatic tire for motor vehicles, which appears to possess several features of merit, it being claimed that it comprises several points of the solid, cushion, and pneumatic tire combined in one new tire. The tire has practically (1) a solid, interchangeable rubber-tread held by two endless electrically-welded steel wires on to the semi-circular (2) pneumatic tire and cover (inner tube), held in place by a special fastening to the side-flanges of the (3) steel rim (semi-circular), forming an air cushion. The rim is built up of three parts, so that the two side-rims may be cheaply and easily replaced without in any way interfering with the spoking of the wheel. The tread is so formed that when worn out it can be cheaply and easily removed and replaced. Should a puncture occur, which is claimed to be very improbable, the tire is so constructed that it will immediately collapse entirely inside the rim, and the wear will then be partly on the side-rims and partly on the tread. The rim is so constructed as to provide surfaces for a rim brake, also designed by Mr. Simms, a specimen of which is to be seen on the stand.

Messrs. Mulliner, of Northampton and 28 Brook Street, London, W., exhibit a Daimler car, the carriage-builder's portion of which is the product of their works. This firm is making a speciality of, and has earned a high reputation for, this class of work, several specimens of their carriage bodies being visible in other parts of the exhibition.

Messrs. Brampton Bros., Ltd., of Oliver Street Works, Birmingham, make a small display of their now largely-used motor-car driving chains. These are made in both solid block and roller pattern, in pitches from 1 in. up to 3½ in. pitch. The products of this firm are too well known in the automobile world to require any lengthy description at this time.

Messrs. Selig, Sonnenthal & Co., of 85 Queen Victoria Street, London, E.C., are the only firm showing machine tools, their exhibit comprising a very large range of tools and machinery used in the manufacture of motors and motor-cars.

---

AUSTRIA is about to try the motor-omnibus in an interesting part of the country. There is to be a daily service from Meran, in the Tyrol, to Trafoi and back, from Handeck to Trafoi and back, and from Meran to Handeck and back. On the first line a 10-h.p. car for fifteen persons will be used, and on the second a motor of equal power, the car seating twelve persons and standing room for six. The third car is to take the mail and ten passengers, and will run at higher speed.

On returning from the Automobile Club's fifty-mile trials, we were crossing from Gower Street into Tottenham Court Road, when we thought we heard the peculiar sound emitted by the "Lifu" when on its travels. Shortly afterwards, indeed, the "Lifu" wagonette, which ran so well at the Whitsuntide tour of the Automobile Club, turned the corner and came into view. Mr. House and a party of friends were on board, and they informed us they had had an extremely satisfactory run up from Portsmouth that day.

## MIDLAND MOTOR NOTES.

By "VERAX."

### A New Birmingham Firm.

MR. CHAS. TURRELL, late of the British Motor Syndicate, who has lately been engaged in building a small motor "quad" at the works of Mr. J. G. Accles, of Holford Works, Perry Bar, in this city is, I understand, going into partnership with the latter gentleman, with a view to building motor cars and motor cycles. The Accles Motor is of the De Dion type, but the cooling *ailettes* are not cast with the cylinder, but after being turned are driven on to the cylinder barrel. The appearance is similar to the Dion cylinder, except that the ribs are very much thinner and closer together, greater cooling effect being claimed by this means of manufacture. Mr. Turrell has been connected with the British Motor Company for some time, so has had the advantage of that firm's experimental work, which should stand the new firm in good stead. The first "quad," I understand, has given very good results on the road. The motor is placed right in front of the car, to get the full advantage of the "head breeze" for cooling purposes. I have not as yet had an opportunity to try this motor, though I hope soon to give more particulars of it. It is possible that there may be one at the Richmond Show. This, however, remains to be seen. I understand, too, that the new firm are intending to give advice and assistance to amateurs and other firms in the production of motors and cars, and under the circumstances this should be of mutual advantage.

### An Abandoned Experiment.

SOME time ago I came across a gentleman in Birmingham who was bringing out a car on entirely new lines. The engine was to start with compressed air, and then work as a petrol motor. To absolutely annul vibration the motor was to have been placed across the vehicle—a horizontal motor, of course. There was much talk at the time, and this machine was to lick creation. Nothing further, however, has been heard of this, and I am just informed that the inventor and the builders have been obliged to abandon the scheme. Of course, the man who never makes mistakes never makes anything, and I hope this gentleman will be more lucky with his next invention, whatever it may be.

### A Question of Average Speeds.

MR. LANCHESTER'S car, which has frequently been seen about the city, and on more than one occasion has been stopped for "furious speed," as a breach of the regulation in this direction is called, has, I understand, done very well in the Automobile Club trials, though apparently much difficulty was occasioned in keeping to the legal limit of speed, a dead stop being necessary at many of the milestones to allow for reducing the average speed to twelve miles per hour. As everyone knows it is practically impossible to design a car which will make an average speed of twelve miles, especially when long inclines have to be negotiated. For instance, a car which would carry four people up a long three-mile gradient, the average rise of which is say 1 in 10, at twelve miles per hour, would have to be very strongly built in itself, and have to carry a very powerful engine. The engine would have to indicate roughly 16 h.p., and the lightest car to carry this would weigh at least 30 cwt. To take the hill the other way—that is, down—at twelve miles per hour it would not be necessary to have an engine at all, as the weight of the car plus passengers would be enough to carry it down, and at considerably above the twelve-mile limit. Ergo, to build a car which will run this speed on the level, without overworking the engine, means that speed up-hill must be taken at somewhere between two and five miles at best. To look at the matter from

another point of view, to maintain an average speed of twelve miles per hour uphill and down it is absolutely necessary to overrun that speed on occasion.

### Coventry Manufacturers.

THE Raglan car, of which I have previously made mention, is practically a copy of the two-speed Benz Ideal, with the exception that the car is somewhat heavier, owing to its more massive construction. The wheels are altogether heavier and have Clincher tires fitted; the counter-shaft bearings are made solid with the bracket plate, thus being much stronger than the makeshift way in which they are fitted by Benz. The loose pulleys run on ball bearings, lessening friction, and lengthening their life considerably. The chains used are Brampton's roller, which wear very well indeed. A departure from the ordinary Benz practice is the use of a cam and lever for opening the gas admission valve; the air valve at back of cylinder is still retained, and is adjusted by means of a nut and lock nut. A large increase of power is gained in this way, which is especially noticeable up a long hill, and there is no doubt that, though the idea is by no means a novel one, it is a great improvement. The Benz engine runs ordinarily at slow speed compared to other petrol engines, and consequently, if that speed is considerably reduced, the automatic gas valve fails to give enough opening, and hence a weak charge. In the Raglan car, when the engine is running dead slow, the automatic air valve is scarcely opened at all, and gas valve fully opened, so that a rich charge is obtained under all conditions. The engine gives over  $3\frac{1}{2}$  h.p., and the car is a very fast one, and takes hills very well indeed. The firm would be wise to show this car at the Agricultural Hall, and, as in "scantlings," they have generally followed the Benz design, it therefore stands to reason that their parts will fit a Benz carriage. The firm are also taking up the manufacture of tricycles and, I believe, smaller cars.

### The Motor Agency Co.

THIS is a small firm whose offices and works are situated in Ryley Street. Mr. Crouch, late of the Coventry Motor Co., is managing. The firm has, I suppose, obtained most of the relics of the old Company in the shape of old motettes and Dion tricycles and other small machines. These machines are being re-built and generally made saleable, and, I believe, are being disposed of at very reasonable figures. The firm also undertakes the manufacture of vaporisers, tanks, or, in fact, any parts for small motors, including castings of Dion type motors, which they supply either in rough or finished state.

## THE FRENCH MOTOR-CAR EXHIBITION.

THE first impression of the Motor-Car Exhibition at Paris is that no striking novelty is to be seen, although there are many indications that efforts are being made by manufacturers to produce a small motor-car at a price within the means of those who cannot spend 10,000 francs for a 6-h.p. car. Nearly every manufacturing firm shows a voiturette, but, of course, none have attained perfection at the first general attempt to meet this want.

The great mistake that has been generally made, according to our opinion, is the adoption of the De Dion (or a similar) motor, which is invariably badly placed so far as ventilation is concerned. When working on a low-g geared vehicle, a De Dion motor naturally becomes heated, and if precautions are not taken will not work properly, especially when ascending hills. This criticism having been recorded, we will deal more particularly with the principal displays.

The well-known firm of Panhard & Levassor show different models of cars up to 12 h.p., and some which suc-

cessfully competed in the Paris-Bordeaux race. They also exhibit a wagon fitted with a powerful motor, and the Panhard voiturette, while Charron has a Panhard launch fitted with a Phoenix motor.

Peugeot shows various models of cars, amongst them being the 18-h.p. car of Giraud, which was in the competitions at Nice, and a very pretty 3-h.p. voiturette for two persons. This is built on the same lines as their larger vehicles, and is certainly a very good type of car.

Tricycles and quadricycles are to be seen at De Dion's stand, where a two-seated voiturette also attracts attention. This has a 3-h.p. vertical motor, similar in design but larger in size to those applied to the tricycles. It is also supplied with a water-jacket, which De Dion regards as quite indispensable. The car has also a speed control. The power is transmitted by cog wheels and without chains, the weight of the voiturette being about 250 kgs.

At Darracq's stand the new Leon Bollée car can be seen. In the front of this is a 5-h.p. motor without any provision for water-cooler, and of similar design to the motor employed on the Bollée voiturette. The transmission of power is obtained by a belt on two differential pulleys.

The Société Decauville has a large display of their well-known voiturette, and also a new car fitted with a 4-h.p. vertical motor placed in the front of the vehicle, and cooled by the circulation of water. The power is transmitted by cog wheels in a way not dissimilar to that of the voiturette, but there is the further immense advantage of securing a proper and thorough cooling. Electric ignition has been adopted, and in principle and general conception the car is very similar to that of the De Dion type.

In the large hall of the Exhibition the Gardner cars (Benz system) are shown, and there will be seen Mr. James's racing car, fitted with a two-cylinder motor of 16 h.p. The change of speed is effected in a very similar way to that employed by Amédée Bollée. Three valves are provided, the third being utilised to cut off the gases admitted to the cylinder when required so as to have a smaller compression. Thus the carburettor always acts under the same stroke, even when the gases are cut out, as the mixture is constant. The adoption of this third valve is a great improvement. This car was intended to have taken part in the Paris-Bordeaux race, but was not ready in time.

In the hall, to the left of the principal entrance, are the new Gladiator cars, fitted with a strong two-cylinder motor. The driving is by chains and cog-wheels. At the same stand a small voiturette with an Aster motor is also on view, receiving considerable attention from the public.

Another interesting display is that made by M. Noé Boyer, who exhibits a Phœbus voiturette fitted with a De Dion motor, which is placed behind. Two speeds have been provided for, but we are rather afraid the motor will have a tendency to become overheated.

Among the many voiturettes at the show fitted with De Dion or similar motors, one of the most successful applications is certainly that of M. Contouier in the "Victoria Combination." This is practically the rear part of a tricycle attached to a trailing car, and the arrangement is so ingenious that a person seated in the little car can manipulate the carburettor, ignition, etc., by the steering handle. The car only weighs 160 kilogrammes; the motor is very well aerated, and a change of speed is provided which enables the ascent of hills to be undertaken with the greatest confidence. The carburettor adopted is the Longuemare, which effectually obviates variation of carburation on any bad roads that may be encountered. Another point about this "Victoria Combination" is that the motor can be started before the driver takes his seat in the car.

The Renault voiturette is another excellent exhibit of a similar character which possesses some useful features. It weighs about 200 kgs., and has the appearance of a small Panhard car. In the front of the vehicle is a box, which constitutes an air funnel, and in this a De Dion motor is fitted. Three-speed gearing is provided, and altogether the

car is likely to prove a success. It can travel at the rate of 30 km. per hour, and will ascend any hill with two persons without the motor becoming overheated.

Another voiturette worthy of mention is the Riancy car. The general arrangement of the parts and the whole design is very ingenious, but unfortunately is not without complications. The motor and steering gear are in the front part of the voiturette, the former having one cylinder and two pistons, the explosion taking place between the two latter.

From Malines (Belgium) come M.M. Vincke et Delmer with a car very like the French Panhard on first glance, but it is considerably heavier, and the workmanship does not appear to be so noteworthy.

Curiously enough, the German firm, Durkopp, also have a car on exhibition which is like a Panhard, fitted with a Phoenix motor.

With the exception of the Serpollet steam car, steam vehicles do not seem to be making any progress, and there are none on view with any special features to be noted here. On the other hand there are many electric cars which, although shown by different firms, have many points of similarity.

A much-appreciated exhibit is that of the electric auto-cab of Chvr. Draulette, in which the passengers are seated in a somewhat novel manner. They enter from the front of the vehicle, and instead of sitting opposite each other are ranged in a semi-circle, four persons being thus comfortably accommodated.

Several of the best types of American vehicles are also on view, the Waverley, the Columbia, the Riker, and the Cleveland cars being the most notable.

From this cursory glance at the Exhibition, readers will have some idea of its scope and range; but it is our intention to deal more fully with the novelties shown in subsequent reports, so that those who read *The Motor-Car Journal* will be kept fully acquainted with the latest developments in the automobile world of France.

D. FARMAN.

#### FAST TIMES AT THE CRYSTAL PALACE.

Messrs. S. F. Edge and C. Jarrott, on Monday evening last, at the Crystal Palace, started with the idea of seeing what distance they could do in the hour. The night proved anything but favourable to record breaking, there being a lot of wind, and the air rather chilly. The times were taken by Mr. F. W. Baily, one of the official timekeepers to the Motor-Car Club, and the result proved highly satisfactory.

| Distance. |       | Time. |      | Leader. |          |

## SCOTTISH NOTES.

**230 Miles in One  
Day—A Record  
Run.**

LAST week I chronicled the fact that Mr. John Stirling, of Hamilton, left Edinburgh on Wednesday, June 14th, on his motor dog-cart to drive to London in time to attend the opening of the Automobile Club Show at Richmond. I expected, as a result, to hear of a very successful and interesting run extending over some three days, for the distance from Edinburgh is no less than 400 miles. I was rather surprised, therefore, on reaching Richmond Park on Friday morning to take a preliminary walk round the show ground and marquees, to find Mr. Stirling and his car already on the spot, and Mr. Stirling busy superintending the placing in position of the numerous show cars which had come up the previous day from Hamilton by rail. On inquiry I learned that he had reached London the previous night and had driven down to Richmond immediately after breakfast that morning, having accomplished the long journey in what must be regarded as record time in two days. Mr. Stirling informed me that he failed to reach York (203 miles) the first day as he had intended, chiefly owing to a delay of over two hours at Newcastle attending to business letters and also to the unexpectedly hilly and broken state of the roads through the Durham county and neighbourhood, over which progress was necessarily slow. Shortly after 10 p.m. Northallerton (33 miles north of York) was reached, and here he stopped for the night, having covered the very fair total of 170 miles for the day. With 230 miles before him he left Northallerton at 7.15 on Thursday morning; between 8 and 9 o'clock in the evening he was sailing into Biggleswade (45 miles from London), through which place he was piloted by the genial Dan Albone, reaching London at midnight, and thus establishing what is undoubtedly the day motor-car record for this country with 230 miles. At my request Mr. Stirling has kindly given me some particulars of his remarkable ride, which I have pleasure in reproducing:—"Shortly before 5 a.m. on Wednesday morning," writes Mr. Stirling, "I, accompanied by my man, left Edinburgh on my Stirling-Daimler dog-cart. We had no other passenger but we carried about 3 cwt. of baggage, including a supply of petrol which I estimated would last the journey to London. The morning was clear and held out the promise of a fine day, which promise was amply fulfilled. Mr. T. R. Outhwaite, secretary to the Edinburgh Auto-Car Co., Ltd., who had heard of my intended run, turned out and kindly escorted us as far as Haddington (16 miles) on his wagonette. Travelling well over the good roads, Dunbar (27½ miles) was reached at 7.5. Just before leaving the town, as we approached the handsome new hotel at the south end I observed what looked like a motor-tricycle drawn up in front, and on closer inspection found my friend Mr. Drummond, of Stirling, engaged 'oiling up' his 'De Dion' before proceeding on his way to London. As he did not intend leaving for another hour, I pushed on to Berwick (57½ miles), which was reached at 9.15. Here we 'oiled up' and breakfasted, and just as we were preparing to start at 10.30, Mr. Drummond arrived. We stopped for a few minutes at the Post Office, where the car was soon surrounded by the usual crowd of interested spectators, including the Chief Constable, who being on his way to Tweedmouth was anxious to have a ride on a motor-car, and during the run of some two miles he admitted that it was he who had stopped and summoned Mr. T. R. B. Elliot under the old Locomotives Act. After his rapid and comfortable motor ride, he naturally made up his mind that he would never do such a thing again. Leaving the Border we soon passed through Belford, and continued without stop through Alnwick (29½ miles from Berwick), Morpeth (48½ miles), to Newcastle (63½ miles), which was reached at 3.45. Being detained by business correspondence, I did not leave Newcastle till 6.30. Here the state of the

roads perceptibly changed; instead of the fine even surface of the previous sixty miles we found the roads much broken up by heavy traffic, and out of consideration for my 'trusty steed,' I pulled down to the second speed. This speed predominated right through Durham (14½ miles), improving, however, towards Darlington (33 miles), and on to Northallerton (49½ miles), arriving at 10.15. We stopped here for the night. After an early breakfast we left Northallerton at 7.15, for York (32½ miles), which was reached at 9.10. The roads continued to improve, and, as our times indicate, we were able to make very good running, especially through the thinly populated districts, where villages were few and far between. Doncaster (66½ miles) was reached at 11.15. This run from Northallerton to Doncaster was completed without stop, and was the longest 'non-stop absolute' run on the journey, viz., 66½ miles. An hour and a quarter was spent here in replenishing the petrol tank and luncheon, and we left again at 12.30 for Grantham (52½ miles) which was reached about 4 o'clock. A fifteen minutes stop was made at the Post Office there, after which we went on to Stamford, reaching Stamford Hotel (73 miles) at 5.15. We left Stamford at 6.15, going by Norman Cross and Eaton Socon to Biggleswade (45 miles) at 8.45, where Mr. Dan Albone was good enough to put us on the best route to London. Darkness was coming on, and we lit our lamps here and started on the last lap of our journey. Passing through Hitchin, Hatfield and Barnet, we reached London at midnight, making our total for the day 230 miles. Although some fast running was made on this journey, in passing through towns and villages the speed was reduced to six to eight miles an hour, and along the whole route the passage of the car excited great and in many cases enthusiastic interest. I may say that the only damage inflicted on my car by the trip is one broken leaf in the hind springs, which I did not observe till near London. The car was built more than a year and a half ago, and has been in constant use since, its last journey bringing up its running to almost 12,000 miles. During the Richmond Show it has been on the track daily, and appears to run better than ever. The cost of the Edinburgh-London trip, I find, works out at less than ¾d. per mile."

**The  
Show.**

As I hinted last week, the Scottish motor-car exhibits at Richmond would be very worthy of inspection, and I thought would compare favourably with anything in the Show, either or English or foreign manufacture. I was scarcely prepared, however, to find that on all hands the productions of the Hamilton firm were acknowledged to be designed and finished in the finest style, and I dare say this will not escape the eyes of the judges.

**Scottish Visitors  
at  
Richmond.**

AMONG the visitors from the North at the Show I observed Mr. P. Drummond, of Stirling, looking fit and well after his "tricycle trip" from Stirling to London. He came up more leisurely than the Hamilton crew, but did some excellent work. From Edinburgh I noticed Mr. John Love, manager of the Edinburgh Auto-Car Co., Ltd., with one or two of his directors; also Mr. McArthur, of Perth, and other familiar faces from Glasgow.

**Stirling's  
Victoria de Luxe.**

I HAVE secured from Messrs. Stirling the first photograph of their Victoria de luxe fitted with a new Pennington motor, and which did not reach Richmond until the middle of the week, but which attracted an enormous amount of attention.

"BROWN HEATHER."

## CORRESPONDENCE.

### A TRIP TO THE WEST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following may be of interest to your readers, not only in showing the utility of the motor-car, but also in pointing out the exorbitant charges of the railway companies if they once get the motor-car man in their clutches.

Accompanied by my wife I went for a run from London through Aylesbury to Farringdon, where we put up for the night. The next day I had a short run into Stroud (Gloucestershire), and took friends up each of the five valleys running out of the town. I put up for the second night at the George Hotel. I would strongly recommend this route to anyone wanting a capital run, as the roads are good all the way, and the scenery is splendid. The hills are not at all bad, and my old Daimler took them easily. I started on the next day through Wootton Underedge to Bath, where we lunched, and the third night found us at the Three Choughs, Yeovil. On the following day, Sunday, we visited friends in Yeovil and delayed starting till four o'clock. We got to Exeter, and spent the fourth night at the New London Hotel, Exeter. On the Monday I started for Torquay, going a long way round through Teignmouth, arriving at Torquay in time for tea. Staying at the Queen's Hotel we spent three days in the locality, returning each night to Torquay.

The men in the stable yard where I put up objected to washing a motor-car, saying that they did not keep engineers there, so I saved the money, excepting one day when I went to Totnes and found the men there had more sense. I told them if they cared to wash the car while I was going down the Dart they should have the 1s. 6d. I usually paid. On my return I found the car nicely washed and dusted. After spending three nights in Torquay I commenced the return journey, putting up at the Castle Hotel, Taunton, and leaving the next day for Andover, where I put up for the ninth night, thus leaving an easy day's run for the finish to London. But I had noticed a slipping of the gear wheels; so I had a piece of iron made to force the bevelled wheels deeper into the gear. This improved matters, and I thought I should get home easily; but suddenly there was rather a bad smash up of cogs in the gear box. I then found that the cause of my trouble had been one of the bolts working loose on the main bearing in the gear case. It had broken and dropped into the gear case, damaging the gear wheels. The vibration thus caused had broken the petrol pipe and I had lost my petrol. The only chance I had was to accept the services of a hay wagon, and be towed to Oakley station on the London and South Western Railway. I asked the station-master the cheapest way to send the car to London, and as I was in no hurry he recommended goods train; so I sent it by that train, and was surprised to be charged £1 16s. 4d. for the fifty miles transport, or nearly 9d. per mile. It was a bad break-down, but it will have to be a much worse one before I shall again put the car on the rail, as I could have towed it home by road for less. I should add that I found the hotels I have mentioned comfortable, and that I had no trouble in getting supplies of petrol, although I had made no previous arrangements for it.

South Hampstead,  
June 19th, 1899.

Yours truly,  
E. ESTCOURT.

### THE AUTOMOBILE CLUB'S LONG-DISTANCE TRIALS FOR ELECTRICAL VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to your paragraphs in *The Motor-Car Journal* for this week, I wish to observe that the four-wheeled electric buggy which is built on my system carries my accumulators and controller, was furnished with a battery that had run 500 miles already under most trying conditions, and at speeds of 26 miles an hour and more. The battery was sealed up, and the car did not only the fastest

hill climbing on Petersham Hill, but, with the judges' seals attached, ran the next day the long distance trial. On that day the distance covered was 36 miles in 3 h. 9 m., as per our cyclometer and the watch which we carried on the buggy.

The reason we make the distance more than stated in your columns is due to the fact that on two occasions the vehicle was taken out of the proper course by the observer, who was on board. I also wish to state that, though our carriage is considerably smaller and lighter than the Mackenzie Company's phaeton (Riker system), yet our vehicle carried 28 lb. more weight in passengers. I also beg to challenge the statement that the Mackenzie carriage did anything like 29 miles before the running down of the cells. It may interest you to know that the open circuit voltage of 40 of my cells before the hill-climbing test was 89 volts, and the open circuit voltage after the test was 88 volts. The open circuit voltage after the long distance trial was 81 volts directly on stopping, and then rose to 84. We could easily have done the distance over again at any average speed up to 18 miles an hour. I shall be greatly obliged by your inserting this letter in your next issue.—Yours faithfully,

ELECTRICAL UNDERTAKINGS, LIMITED,  
12 Miller Street, Camden Town. HENRY LEITNER.  
June 16th, 1899.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your description of our vehicle in the electric motor trials at Richmond in your last issue, I should be glad if you would call attention to the fact that our battery was only charged for twenty miles, as explained to the judges. We were also labouring under the disadvantage of having four of our cells broken overnight.

If you will therefore call attention to this in the next issue of your valuable journal, we shall be much obliged.

London, S.E.,  
June 19th, 1899.

Yours faithfully,  
A. MACKENZIE.

### THE SPEED OF MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It has given me considerable pleasure this year to be present at the track motor races which have been held at the Palace by the Motor-Car Club, and I must say that for interest and excitement this particular sport has a fascination for me. One point I should very much like to see threshed out is as to which is the fastest motor-tricycle at present in England. On May 6th, Mr. Jarrott beat Mr. Wridgway in the five-miles race by a mere length. On Whit Monday Mr. Wridgway won both the mile handicap and the twenty miles scratch, but Mr. Jarrott had bad luck in the earlier part of the race, and Mr. Edge was also not riding up to his best speed; and the question is still an open one in my mind as to which is the speedier of the three. As Mr. Weigel is also confident that he can easily beat any of the above-mentioned gentlemen on his new machine, I think that an open match between these speedy riders would prove of very great interest. As I understand there will be a Motor-Car Club race meeting at the Crystal Palace on July 1st, I shall be very pleased to put up a silver cup for competition for the purpose, firstly, of seeing some good sport, and, secondly, for the purpose of finding out which is really the faster.

I trust, therefore, that Mr. Baily will see his way clear to include an item of this description, which I would suggest should be for ten miles.

Hampstead, N.W.,  
June 20th, 1899.

Yours truly,  
FRANK F. WELLINGTON.

LAST Thursday week Messrs. Guinness, the well-known brewers, started an experimental motor-lorry, which ran well till Monday last, when it collided with the kerb and threw out one of the porters.

### FURIOUSLY DRIVING A MOTOR-CAR.

At Retford on Monday, Leonard Woodbury, Clifford Robinson, and James Clarke, all of Chiswick, London, were summoned for driving a motor-car through the streets of Retford on May 30th at a furious pace, to the danger of the public. Mr. Williamson appeared for the defendants and explained that there was no dispute as to the furious driving. The defendants, however, were now on the Continent, and could not appear to answer the summons, except at great inconvenience. They had instructed him to appear and offer their apologies to the Bench for having given any trouble. Police-Constable Evans said the defendants rode at a furious pace down Bridgegate. He thought the rate about twenty miles an hour. John Smith, a painter, in the employ of Messrs. Hopkinson, said the car passed within ten inches of the ladder on which he was working. The defendants were fined £1 13s. each, including costs.

### SERIOUS MOTOR-CAR ACCIDENT.

A SERIOUS accident to a motor-car occurred on Monday last at New-bridge Hollow, a well-known place on the Chester highway, between Altrincham and Knutsford, and three persons were injured. Shortly after four o'clock the car, which belonged to Bond's Soap Company, Salford, was being driven towards Altrincham, in charge of Mr. H. Barnes, a traveller in the employ of the Company. With him were two ladies, named Mrs. Scaling, wife of the manager of the firm, and Mrs. Wood Smith, both of whom belong to Manchester.

As the car was descending a deep slope at a fast rate, about two miles from Altrincham, there was a terrific explosion, and almost instantly the oil ignited, and wrapped the car in a sheet of flame. The vehicle turned over, and Mr. Barnes, who was pinned beneath it, received shocking burns. He was rescued by a man named George Whitfield, a gardener at the residence of Mr. Heywood, which is close by, but he was quite unconscious, and was conveyed to the Altrincham Infirmary.

Both ladies were slightly injured. The bonnet of one was burned off her head, while the hat of the other lady was also partially burned. The position of Mrs. Scaling was one of great danger, and she informed a reporter that she must certainly have been burned to death but for the help promptly rendered by a man who dragged her away from the burning car. The ladies were driven to the infirmary, and, after being attended by the medical staff, were allowed to go home. The car was totally wrecked, and the remains were tossed into an adjoining field. The whole of the contents were also destroyed by the fire.

#### TRUE ACCOUNT OF THE ACCIDENT.

A Manchester *Evening Chronicle* representative called upon Mr. Scaling, at the works in Worsley Street, Salford, and was given what that gentleman called the true account of the affair. In the first place, Mr. Scaling asserted that the reports published in the morning papers were very much exaggerated.

"It is not correct," he said, "to state that an explosion took place. Nothing of the kind occurred. I have carefully examined Mrs. Scaling and Mrs. Smith, and they agree in almost every particular. According to their version, they were travelling at the rate of twelve miles an hour. There are four rates at which the car could travel, three, six, nine, and twelve, and the indicator pointed to twelve. They were descending a slope, and suddenly, from some yet unexplained reason, the car swerved into the footpath. The contact with the banking caused the car to up end "nose" downward. The noise from the impact with the earth would probably account for the belief that an explosion had occurred. As the car is hooded, you will see that when on end all possible exit for people inside is practically cut off. That was exactly the position in which my wife, her friend, and the driver were placed. It has been stated that Mrs. Scaling was rescued from her perilous position by a gentleman who was passing. That is not so. She managed with great difficulty to squeeze out through the small opening, and afterwards to pull Mrs. Smith out. This, of course, was not done without her sustaining a large number of bruises. As soon as they had got out a cyclist came along, and he with Mrs. Scaling partly lifted the car whilst Mrs. Smith pulled the driver out by the shoulders. All this time the van had been blazing furiously, for immediately the car was upset the oil was forced through the Bunsen burners, and the blaze increasing, quickly set the wooden box covering the works on fire." "Fortunately," continued Mr. Scaling, "my wife was not burnt, nor was Mrs. Smith. They were very badly bruised about the head and body, and were greatly shocked. Barnes was burnt about the legs and hands, and his condition when conveyed to the Altrincham Hospital was considered critical. I am glad to hear, however, that he is much better this morning. I have to thank a gentleman, whose name I had not been able to get, for his kindness in taking Mrs. Scaling and Mrs. Smith to the hospital in his trap and Barnes on a lorry. By the way, Barnes is not a traveller, as was stated in one of the papers. He is the driver." "Have you had accidents with the car before?" asked our reporter. "No. It have always run with perfect ease before, and we have never had cause for complaint. Barnes, in addition to being a very experienced driver of motor-cars, is a practical mechanic. He has driven the car in London, Liverpool, and Manchester, amongst the thickest traffic, and that fact makes me hesitate at blaming him for the accident. At the same time I do not think it would be fair to say the car was defective until I have heard Barnes' story." "Where

was the car made?" "We bought it from the makers in Coventry, where, of course, we shall send it for renovation." "Is there anything left to renovate?" "Oh, yes; all the machinery is there, but badly scorched." The representative was afterwards taken into a shed where the remains of the car were locked. It presented a very wrecked appearance. All the woodwork remaining was on the two front wheels. The rear wheels were burnt to the axle, and not a scrap of the covering remained. The car was not insured. On inquiry at the Altrincham Hospital on Tuesday morning it was stated that Barnes had passed a good night, but was still undergoing considerable pain.

### A DRUNKEN DRIVER.

ERNEST EUGENE HICKS, a motor-car driver in the service of the Post Office, was summoned before Mr. Horatio Davies at the Guildhall Police Court on Friday last, for being drunk whilst in charge of a motor-car.

Constable 250 saw the defendant driving through Barbican into Long Lane, West Smithfield, at a fast pace. He subsequently heard a tremendous smash, and running down Long Lane he saw the defendant's motor-van had dashed into the front of the Portland Arms, smashing all the windows and the front. The motor, of which the defendant had lost all control, was also seriously damaged, the hot water escaping. The defendant was drunk. He pleaded that he had been a teetotaler for a long time, but on the previous day, owing to the hot weather, took several glasses of beer. He received a very good character.

Sir Horatio Davies said it was a most serious thing for a drunken man to drive a horse, but when it came to a cumbersome motor-van the danger was increased. It was not only a serious matter to the defendant's employers, but to the public. He imposed a penalty of 40s. or one month's imprisonment.

### MOTOR-CAR ACCIDENT ON NORTH DEESIDE ROAD.

IN Aberdeen Sheriff Court on Tuesday last—Sheriff Robertson on the bench—proof was led in an action at the instance of Wm. Cromar, plumber, 260 Union Grove, Aberdeen, against William Harper, manager in Scotland of the Benz Motor-Car Co., for £500 for personal injuries alleged to have been caused by a motor-tricycle, belonging to and driven by defender, running into and knocking down pursuer, in consequence of which he sustained a compound fracture of his left leg in two places. It was also averred that pursuer's bicycle was damaged to such an extent as to render it practically valueless. Pursuer's version of the occurrence was that on August 6th last, he, along with A. Mitchell, brass finisher, 258 Union Grove, and Charles Ross, builder, 74 Devonshire Road, Aberdeen, went for a cycle run. They had a spin along the north Deeside Road, and crossed to the south road by the Miltimer Bridge. They called at the Mill Inn, where their attention was attracted by an itinerant showman who was exhibiting a strength-testing machine near the door of the inn. Pursuer and his friends had several turns at the machine, and then went back for their bicycles, which were leaning against a pailing near the inn door, while the showman proceeded with his machine to the left-hand side of the road. A small crowd gathered round the showman, and pursuer and his friend, leading their bicycles, went over to the left-hand side of the road also, and stood holding their bicycles on the outskirts of the crowd watching the proceedings. While they were thus engaged a motor-tricycle car driven by defender swept down upon them, and struck pursuer and his bicycle with the result mentioned. The motor-car, pursuer averred, at the time of the collision was being driven by defender at a furious and reckless rate of speed, at a part of the road which was usually crowded on a Saturday afternoon. Indeed, the car, according to pursuer's statement, was being driven at a rate of over twenty miles an hour. In consequence of his injuries, pursuer was unable to attend to his business, and the consequence was that it came to a standstill. Defendant had been called upon to make reparation, but had declined, and hence the present action had been brought.

The defence was that pursuer had not been injured through any fault of the defender or anyone for whom he was responsible, and that consequently he was not responsible for reparation.

His lordship, after hearing evidence for the pursuer, adjourned the case for further proof to a date to be afterwards fixed.

Mr. J. M. Ferguson, advocate, is agent for pursuer, and Mr. Alex. Blacklaw, solicitor (for Mr. R. D. Leslie, advocate), is agent for defender.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### The Automobile Show.

In sunshine the show was opened, and in sunshine it closed. Although at times the weather was threatening, yet the Exhibition suffered but little from the rain. Just a few hours one day, that was all. The attendance was never satisfactory, and the result will be, we understand, a call on the guarantors to the extent of over fifty per cent. of the amount guaranteed. Some business was done, and a few firms expressed their satisfaction at the results, but the majority of exhibitors were not of the same way of thinking. Richmond is out of the way and difficult of access from the metropolis. Most of the trains during the day from Waterloo are supposed to take forty-five minutes by the time-table, but, as a matter of fact, they took much longer.

### The Awards.

In another column we give a list of the awards made at Richmond, and, as is usual, these awards will not fail to cause dissatisfaction to those who were not fortunate enough to gain the highest honours. We are unaware of the lines the judges worked upon, and we, with others, await with interest the publication of their report. This report the unsuccessful competitors are entitled to expect, and we trust there will be no unnecessary delay in its appearance.

### Close of the Show.

HAD the public been present in numbers at Richmond, the demonstrations of control by drivers would have done much to have allayed any fears people may have entertained of the risks of riding in motor-cars. The way the vehicles were running in and out and around each other on the grass was simply wonderful, and it is surprising so few collisions occurred. Those that did occur were in no way caused by an absence of control, but rather from local circumstances. Going from one enclosure to another was a sharp right-angle turn, and here a Headland vehicle was run into, but beyond bending some spokes no harm was done. Mr. Lanchester was leaving the grounds on his car, and the way was signalled clear. The "Lifu" wagonette, however, was coming on at full speed, and the result was the Lanchester car sustained a bent axle and had two wheels buckled. On the last Saturday Mr. Zacharias rode full tilt into an International, bending the latter's axle, while at the conclusion of the motor tricycle-handicap, Mr. Roger Fuller, one of the competitors, fell and brought down Mr. Edge. Both machines were damaged, but the riders were unhurt.

### The Question of Ignition.

THE recent terrible death of the Altrincham driver, Barnes, again compels attention to the question of ignition. This question has arisen many times, but mostly in relation to motor-tricycles, and the result is that very few tricycles now use "lamps." We hold the opinion that any

tricycle having other than electric ignition is absolutely dangerous, and as such should not be allowed on the roads. Regarding heavy cars, the question is more open; but very many people, rather than risk accident by fire, will undoubtedly use batteries. We certainly shall do so in the new (English) car we are having built. We are not alarmists, but feel that the risk of the "link in the chain" is quite sufficient risk to take.

### Driving Chains for Motor-Cars.

ONE of the visitors to the Automobile Club's Show at Richmond on the closing day was Mr. Hans Renold, the well-known cycle chain manufacturer, of Manchester. It is now fairly well known in automobile circles that Mr. Renold is preparing to take up the manufacture of driving chains of both the block and roller type for motor-cars, but we learned from him on Saturday last that owing to the extensions at present being made to his cycle chain-making plant some considerable time will elapse before the new motor-car chains will be ready for the market.

### A Map for the South-West.

MR. HARRY R. G. INGLIS, to whose road maps reference was made last week, does not let the grass grow under his feet—or is it a motor-car on which he scampers over counties as though they were parishes? We have just received a copy of his "contour" road map of Devon, Cornwall, Dorset, Somerset, and Wiltshire. The admirable principles already commended find further illustration in the present volume, which has a series of elevation plans of the roads, with measurements and warnings. So far as we have examined, the work can be thoroughly relied on, and its value is enhanced by the general notes on the roads and the ferries, the latter assuming a position of some importance to tourists in the extreme south-west. There is only one attempt at the reproduction of photographs in the book, and of that the less said the better. Otherwise, only praise can be tendered to Messrs. Gall & Inglis on the way in which the work has been issued.

### A New American Two-Seated Petroleum-Spirit Motor-Car.

A NEW two-seated three-wheel petroleum-spirit motor-car is being put on the market in America by the Bramwell-Robinson Co., of Hyde Park, Boston, Mass. According to the *Horseless Age*, the frame of the vehicle is built up of wood and steel. The body of the car, which is not located so high as is usual in American motor-vehicles, is entirely separate from the frame, and is supported thereon by plate springs at the front and C springs at the rear. The motor is of the horizontal single-cylinder type; it is stated to be of 3 h.p., the cylinder being 4 in. diameter by 6 in. stroke. Cooling is effected by radial fins fitted around the cylinder, while the ignition is electrical. The motor, which weighs 240 lb., is arranged on the front portion of the frame, the fly-wheel being located under the passenger seats. The road wheels are arranged two in front and one at the rear; a

feature of them is the employment of tubular steel spokes; pneumatic tires are fitted. Two forward speeds are provided, by means of which and the electrical ignition device any desired speed up to sixteen miles per hour can, it is stated, be attained. The power is transmitted directly from the motor-shaft to the rear axle through chain-gearing, the two-speed gear on the motor-shaft being controlled by a friction clutch. The petrol storage-tank is arranged under the seat, while a handle on the steering standard actuates a band-brake on the hub of the rear road wheel. Steering is effected by means of the front wheels in the usual way, and all the control levers are mounted on the steering-standard. The car is stated to weigh, complete, between 6 and 7 cwt.

#### An American Automobile Club.

THE *Horseless Age* announces that a meeting has just been held in New York of gentlemen interested in the horseless vehicle movement, when the formation of the Automobile Club of America was decided upon. A committee has been appointed to draw up the necessary rules and regulations.

#### A New Petroleum Motor.

LAST week we had the pleasure of meeting Mr. Napier, who kindly conducted us over his extensive works at Lambeth. Mr. Napier is making a speciality of petroleum motors, both for launches and cars. The motor is of the vertical twin-cylinder type, the cylinders being 4 in. in diameter by 6 in. stroke. The ignition is electrical, the sparking plug employed being of the usual form. The inlet and exhaust valves are so arranged that they can be readily removed for cleaning purposes, etc., it only being necessary to slacken two screws and remove one bolt to enable the valves to be withdrawn. The cylinders are provided with a

water-jacket for cooling purposes, the water circulation being maintained by means of a small pump. A special device is also provided for raising the compression valve when putting the motor in operation, a crank handle being provided to facilitate the starting. Ample provision is made for the lubrication of the various working parts, the cranks running in an oil-containing chamber. A centrifugal governor on the motor shaft is also provided, this controlling a hit or miss device which cuts out one cylinder at a time. In connection with their motor, Messrs. Napier have adopted the Longuemare form of carburettor, a device which is very largely used in France, and which has already been described in these columns. The normal speed of the motor is 780

revolutions per minute, at which the engine is claimed to develop 7 b.h.p. Slower or quicker speeds can be obtained by regulating the sparking device. The weight of the Napier motor, complete with carburettor, fly-wheel, and water-circulating pump, is stated to be about 3 cwt. Mr. Edge has had his Panhard engine taken out and Mr. Napier's substituted, and has also replaced his "lamps" with electric ignition.

#### Mr. Butler's Benz.

WE suppose if a ballot was taken at the Automobile Club as to who was the most popular member, the name of Mr. Frank Butler would easily head the list. His geniality and *bon homme* is proverbial, and most members are, or rather were, interested in his double-cylindered Benz with the big bright brass lamps. Alas! he has now disposed of that machine, but proposes, we understand, to purchase an 8-h.p. Benz as well as a small "Lifu" car. We believe Mr. Butler's idea is to keep one machine at Shiplake, where his houseboat is usually moored, and the other in London. We hope he will not be like the man with two umbrellas, who, when it was wet, always had both umbrellas at the other end.

### LONDON STEAM OMNIBUS COMPANY SETTLEMENT.

WE have received a copy of a circular sent out to a group of London Steam Omnibus shareholders by Mr. W. J. Hunter, who has been acting on their behalf in the controversy with the present management and the promoters. The circular is marked "Private and confidential," but it is rather late in the day to regard steam omnibus matters from that point of view. Briefly, Mr. Hunter propounds a scheme, which has been accepted by the other side. Under this scheme (1) the purchase price for the licence is reduced from £210,000 to £50,000 by the surrender of the £140,000 vendors' shares and the acceptance of £50,000 in cash in lieu of £70,000. This leaves £28,304 in cash still to be paid to the vendors out of the £44,000 in hand, or still to be called. (2) Extension of licence is obtained, whereby exclusive right of the steam system is extended to cars generally, and a virtual monopoly obtained in the London area for all British Motor patents (whether petrol, electricity, or steam) in so far as they relate to omnibuses. It is to be noted that the suggested new board decline to assume responsibility for their value. (3) The promoters have to pay the plaintiff's costs of the combination, and further licences are extended, and a provisional contract entered into for constructing vehicles, although at a cost above that named in the prospectus. (4) The present directors retire, and are replaced by certain members of the board of the London Tramways Company. These are the chief provisions of the new arrangement, and under the whole circumstances Mr. Hunter is to be congratulated, especially upon the last point to which we referred. We are not able to follow him in his arrangement to pay the vendors a still further considerable sum in cash, and there is no reason to feel satisfied with the absence of any provision giving the shareholders a right to withdraw and obtain the repayment of their money. But if there is anything in the possibility of business for the Company, it will probably do as well under the new arrangements as could be expected, and the fact that the Lawson interests are eliminated is certainly a good point gained.—*Pall Mall Gazette*.

THE C. H. Black Mfg. Co., Indianapolis, Ind., have issued a catalogue of their petroleum-spirit motor-vehicles, of which five styles are shown—a ten-passenger wagonette, a light delivery, a physician's phaeton, a dos-à-dos trap and a business wagon. Motors of 2½ to 8 h.p. are employed.

## MIDLAND MOTOR NOTES.

By "VERAX."

**The Motor  
Manufacturing  
Company.**

I HAVE called at these works and found the firm overwhelmed with orders for both small and large cars; and, in fact, they have been obliged to refuse orders, as their present plant, complete as it is, is not large enough to cope with the work. At the present moment the firm are fitting about £2,000 worth of new machinery to cope principally with their large trade in De Dion motors and tricycles. I have myself been using one of the firm's 1½-h.p. motors on a tricycle, and there is no doubt that the workmanship of these small motors leaves nothing to be desired, the power being indicated on each motor prior to its leaving the factory. Even in a small motor of this class, as apart from the carriage or tricycle which it propels, there is an enormous amount of work and accurate fitting of parts, which it is perhaps quite beyond the "man in the street" to even imagine or think of, with the result that he is quite unable to appreciate its value. Of course, this remark applies to large motors as well as small, and perhaps in the same degree; but the fact remains that in a small, compact-looking De Dion motor there has been a great amount of time spent in fitting and adjusting, which is perhaps quite equal to the time taken in machining the various parts. It therefore stands to reason that to turn out several of these motors per week, not only is a special plant of machinery required, but also a skilled staff of men. I understand that only during the last week the firm have been obliged to refuse one order for 500 motors, given by a Birmingham firm, the motors having to be delivered at the rate of twenty-five per week. With the new plant the Company hope to be able to cope with much larger orders than this, and to supply nearly three times that number of Dion motors per week. Of the various classes of petrol motors for small power the Dion is deservedly first favourite, on account of its compactness, reliability, and, especially in the 1899 type, the great ease of access to all its vital parts. Of the larger cars which the Company are building much has previously been said in the columns of this paper. The large chars-a-bancs are becoming very popular, chiefly on account of their size and comfortable carrying capacity, and, secondly, on account of their neat appearance and finish. This latter point is a most important one when cars are built for the use of the public for hiring purposes, as a car of nice appearance is naturally much more likely to attract the pleasure-seeking folks; and the success of a motor-car service will be found to depend very largely on this important point. The Motor Manufacturing Co. make a rule never to turn out these vehicles unless they are exceptionally well finished, both as regards their machinery and also external appearance, and to this fact must be attributed the large amount of orders which the Company have on hand. One town in England alone has ordered thirty of these large cars for hiring purposes, namely, Sunderland; only six at present have been delivered, but the others are leaving the works weekly. All the cars for Sunderland are of the wagonette type, and are well patronised by the travelling public. A firm in Edinburgh has also placed a large order for wagonettes and chars-a-banc for the same purpose. At present the Company are capable of turning out two complete cars in this department per week. The small two-seated car which the firm have nominated "Princess" seems to attract general admiration. One of these cars with a single-cylinder engine was shown at the Richmond Show in an unfinished state; it is now daily expected back at the works to receive its finishing touches. Although quite a new departure, the Company have already booked orders for three of these cars, which looks as if they will shortly be doing a large business in them. Mr. Iden,

the ever energetic manager, does not, however, stop at a good thing, but when he has obtained one immediately strikes out for another, hence the various types of car which he produces. Quite recently Mr. Iden tried his new car of the Princess type, with a double-cylinder engine, and her maiden run proved a very successful one, the car accomplishing a thirty-mile run without a hitch of any sort, and to Mr. Iden's perfect satisfaction. On my way from the works I saw one of the Company's latest wagonettes, capable of carrying about fourteen people, running through the town, her size and smart appearance attracting much attention.

**The Daimler  
Motor Co.**

"WELL, we are back again from the Show," were the first words with which Mr. Critchley greeted me when I called upon him at his office this week, and which he emphasised with a kind of sigh of relief. Much as the public enjoy a show, and necessary as it is for manufacturers to put in an appearance, yet at the same time it involves a great amount of work and, I think, unnecessary expense for the manufacturer; and there is so much to be seen at the same time by the public that I think the feeling after it is over is mutual. Altogether, Mr. Critchley informed me, they have about seventy vehicles in course of erection, which shows that the firm are doing a large business. Several 11-h.p. cars are being built, but these, I understand, are only made to order, none being intended for stock. I saw one going out for trial on the occasion of my visit to the works. These cars, as is well known, are very speedy when occasion requires, and also very good hill-climbers; but with their four cylinders there is necessarily a good deal of complication, and a large amount of cooling water is necessary. At any rate, the Company is just as busy as it possibly can be, I am told, and, as it is generally known, the Daimler factory is second to none in this country.

**An Amusing  
Instance at the  
Show.**

WHILE mentioning the Daimler Co. in connection with the show the following incident occurred to me as being very amusing, and more or less instructive. It appears a small Daimler car was running on the track, and was stopped opposite a small batch of people at the track side. For some reason or other a small block of wood had been placed against one of the wheels. A rather timid old gentleman became very interested in the car, and ventured to ask for a trial. This was, of course, at once acceded to by the smart driver, after a thorough explanation of all the good points of the car had been given. However, when the gear was applied the motor suddenly stopped, and the smart driver immediately commenced an inspection of the motor, evidently saying some very nasty things about it *sotto voce*, when the timid old gentleman in the softest way possible said, "Excuse me, sir, but why is that block of wood there in front of the wheel?" There was no reply, but the wood was removed, the starting handle applied, and soon the motor was careering gaily around the course, and the small batch of people left behind smiled.

**A Leamington  
Venture.**

LEAMINGTONIANS were advised by an advertisement in a local advertising sheet that motor-cars were to be run to places of interest in the neighbourhood. It appears that the manager of the Great Western Hotel has hired one or two cars for a week with a view of ascertaining whether the public are likely to take kindly to this mode of enjoyment. On the first day of the week one motor started for Stratford with only two passengers and the driver, so that it would appear the public do not take quite so kindly as they might do. However, I hope they will take more readily to it for the rest of the trial week, otherwise I am afraid the scheme will fall through. The car which ran was a Daimler of

Coventry manufacture, but converted from a parcel van into a wagonette locally some time since under Mr. Crowden's instructions. Though not the best type of car, apparently, to start a motor-car service with in a fashionable town like Leamington, yet I understand better cars will be forthcoming later on. Leamington is an ideal centre, as far as roads and scenery are concerned, for a motor service, but the inhabitants are of a very "horsey" character, and do not take at all kindly to the new method of locomotion, though, judging by the result of their apathy for railways when these were being constructed years ago, whereby the main lines of two important railways were diverted, they are not likely to make a very strong opposition to the undoubtedly useful conveyance, the motor-car. However, the energetic Great Western Hotel manager deserves every encouragement in his venture.

## THE MOTOR-CAR EXHIBITION.

### RAILWAY FACILITIES.

FROM July 3rd to July 15th a number of cheap excursion trains will be run from the provinces, which will materially lessen the expenses of those attending the Motor-Car Exhibition at the Agricultural Hall, Islington, next month. All the leading English lines will be running trips on at least one day during the event, and full particulars can be obtained from any railway station. Some are organising three or four excursions in the coming fortnight—as, for example, the Great Central Railway, which will have special excursions on the 5th, the 8th, and probably the 10th of July. The London, Brighton and South Coast Railway have cheap day return trips from nearly every station on their line.

Many visitors are expected from Ireland, where interest in other forms of traction than horse haulage is developing, and on Monday, July 10th, the Belfast and Northern Counties Railway will have a cheap excursion to London, the tickets being available to return at the close of the Exhibition, or within sixteen days from the 10th prox. On Friday, the 7th, an excursion *via* Waterford and New Milford will be run by the Waterford, Limerick and Western Railway of Ireland.

The Scotch railways will also run special excursions during the period of the Exhibition. On Friday, July 7th, and on the following Friday as well, the Great North of Scotland Railway will have special excursions; and on the 8th, 13th, and 14th the Caledonian Railway Company will afford special facilities to visitors to the Motor-Car Exhibition.

We would cordially recognise the way in which the promoters of the Exhibition have been met by practically the whole of the railway companies having termini or running powers into the Metropolis, and would congratulate automobilists on the fact that so many cheap trips will enable them to see the great display at a very reasonable cost. If the railway companies were as accommodating in the matter of railway rates for motor-cars—but there, "that's another story," as Rudyard Kipling would say.

THE preamble of a Bill for the erection of a station on the Regent's Canal for the supply of electricity has been passed by the House of Lords.

At Harlesden, Victor Taylor was summoned for causing an obstruction with a motor-phæton. The vehicle in question was left all night outside a house in Mortimer Road, Kensal Rise, without any light on it to prevent other vehicles running into it. The defendant said he was staying for a time at Mortimer Road, and thought he could do the same with the motor-phæton as he did with his car in Dublin, where he left it in the road all night. The breaks and engine were locked. He had come from Ireland to answer this summons. He was fined 30s. and costs.

## AWARDS AT THE AUTOMOBILE CLUB SHOW, RICHMOND, 1899.

### DIVISION I.—THOSE CARS THAT TOOK PART IN THE TRIALS.

*Gold Medals.*—Daimler Motor Co., Ltd., for Critchley light car, Siamese phæton, and Rougemont wagonette; Steam Wagon and Carriage Co., for steam lorry; and Motor-Carriage Supply Co., for 10-h.p. and 6-h.p. lorries.

*Special.*—Delahaye Motor-Car Co., for four-seat phæton; and F. W. Lanchester for three-seat car.

*Silver Medals.*—Motor-Carriage Supply Co., for convertible wagonette; Hewetson's, Ltd., for Benz dog-cart and Benz Ideal; Automobile Association, for Mors four-seat car and Barrière tricycle; and Daimler Motor Co., for Post Office van.

### DIVISION II.—GEARS AND COMPONENT PARTS AT THE EXHIBITION ONLY.

*Gold Medal.*—Liquid Fuel Engineering Co., for steam wagonette and omnibus.

*Silver Cup.*—Hon. C. S. Rolls, for best privately-owned vehicle.

*Silver Medals.*—Liquid Fuel Engineering Co., for excellence of component parts of steam vehicles: (1) burner, (2) wheels and steering axles; Clarkson, Capel & Co., for their steam vehicles, burner, and condenser; Mackenzie Carriage Co., for design and appearance of electrical carriages with Riker frames; Electric Motor Power Co., for electric motor-carriages, controller, and steering gear; Motor-Carriage Supply Co., for electric ignition and ignition advance, and for component arrangements in Cannstatt car; Stirlings & Co., for general appearance of Stirling-Daimler motor-vehicles; A. F. Mulliner, for excellence of carriage work for motor-vehicles; Hewetson's, Ltd., for their exhibit of Benz carriages; Automobile Association, for appearance and for motor and gear construction of Gobron Brillé car; Decauville Aine, for two-seated voiturette; Motor Manufacturing Co., for exhibit of motor-cycles on the De Dion system; Mossberg Roller Bearings Co., for roller bearings; and Carless, Capel & Co.

*Bronze Medals.*—Marshall & Co., for improvements in Benz motor-carriages; Des Vignes, Cloud & Co., for excellence of design and workmanship in small steam boilers; Daimler Motor Co., for Price's tire brake; Rubery & Co., for motor-car frames; Roots & Venables, for component parts; Automobile Association, for combined petrol and lubricating tank and pump, and Khülstein-Vollmer tractor; and Ariel Cycle Co., for motor-tricycles.

*Diplomas.*—Lyon & Whitmore, for ignition tube; Southern Motor-Car Co., for improvements in Benz motor-carriages and carburettor arrangement in Papillon tricycle; John Morgan & Sons, for uniform; and Hart & Co. and W. & T. Avery, Ltd., for weighbridges erected and placed at the disposal of the Club.

MUCH as Frenchmen like automobiles, it is doubtful whether the Duke of Orleans appreciated his experience, says a daily contemporary, of one of these vehicles one afternoon last week. The Duke and his secretary arrived at Waterloo Station from his residence at Twickenham about two o'clock, and at once entered a private electric motor-car, which had previously been ordered to take them to the West End. The car was proceeding down the incline from the station to Waterloo Road when, it is stated, the driver of a hansom cab behind attempted to pass. A collision ensued, and the motor was violently precipitated against the wall on the near side, with the result that the steering gear and windows were smashed and the tires dislocated. Fortunately, the Duke and his companion escaped with a severe shaking, and they continued their journey in another cab, apparently none the worse for their escapade. In the evening the Duke was observed to return to Twickenham by his usual train.

## COMMERCIAL EFFICIENCY TRIALS.

### EXPLANATORY NOTES.

**D**URING the course of the Motor-Car Exhibition a series of "Commercial Efficiency" trials will be conducted, full particulars of which will be made known within a few days. Meanwhile, we give the route that will be taken, together with a few other particulars which will be of value to competitors and of interest to the public.

Measurements are counted from the Agricultural Hall, and are taken from Messrs. Gall & Inglis' "Contour Road Book of England" (South-Eastern Division). It is calculated that the Agricultural Hall, Islington (Barford Street entrance), is  $1\frac{3}{4}$  miles distant from the G.P.O., and therefore this distance has been deducted in both the outward and homeward journeys as given in the "Contour Road Book," making the net distance in each direction 36 miles for Classes 6 and 7; 25 miles in Classes 1, 3, 10, 11 and 14;  $12\frac{1}{2}$  miles in Classes 2, 4, 5, 9, 12 and 13; and 15 miles in Class 8.

Milestones are measured from Hick's Hall, near the Metropolitan Market. It is to be noticed that there is an error of  $\frac{1}{4}$  mile in the milestones between Hatfield and Welwyn.

General Route.—The whole of the contests will be run off on the North Road and Biggleswade Road.

|   |                  |                  |                  |                  |                 |          |
|---|------------------|------------------|------------------|------------------|-----------------|----------|
| London (Agricultural Hall, Barford St. entrance.) |                  |                  |                  |                  |                 |          |
| ROUTE   | 9 $\frac{1}{2}$  | Barnet Market.   |                  |                  |                 |          |
| FOR   | 18 $\frac{1}{4}$ | 8 $\frac{1}{2}$  | Hatfield P.O.    |                  |                 |          |
| CLASS   | 23 $\frac{5}{8}$ | 13 $\frac{7}{8}$ | 5 $\frac{1}{8}$  | Welwyn P.O.      |                 |          |
| 6 & 7.  | 30 $\frac{1}{4}$ | 20 $\frac{1}{8}$ | 11 $\frac{5}{8}$ | 6 $\frac{1}{2}$  | Stevenage.      |          |
|   | 36               | 26 $\frac{3}{8}$ | 17 $\frac{1}{8}$ | 12 $\frac{3}{8}$ | 5 $\frac{3}{8}$ | Baldock. |

### OUTWARD JOURNEY.

#### AGRICULTURAL HALL TO BARNET.

Agricultural Hall, Barford Street, Liverpool Road, Upper Street Islington, Highbury Station, Holloway Station, "Nag's Head" cross road, Highgate, junction of roads at Archway Tavern (keep to right), East End Station, St. Pancras Cemetery, "Green Man" Brown's Wells, Finchley Common, Whetstone, Greenhill Cross, Barnet = 9 $\frac{1}{2}$  miles.

(Gradients.—Entering Barnet 1 in 26.)

#### BARNET TO HATFIELD.

Barnet, Wrotham Park, Hadley High Stone (keep to right) (1 m.), Ganwick Corner (1 m.), Potter's Bar (1 $\frac{1}{4}$  m.), then take left road to Little Heath Lane (1 m.), Bell Bar (2 m.) (keep to left), Hatfield = 18 $\frac{1}{4}$  miles.

#### HATFIELD TO WELWYN.

Take left-hand road in Hatfield, and cross railway bridge to Stanborough (1 $\frac{1}{4}$  m.). Up hill for 1 $\frac{1}{2}$  m. from Limsford Mills to Brickwall House (1 $\frac{1}{4}$  m.) to Agot, thence down Digswell Hill into Welwyn = 23 $\frac{3}{8}$  m.

Note.—Ascent to Brickwall House, 1 in 16. Descent in Welwyn, 1 in 14 $\frac{1}{2}$ ; several turns, should be negotiated slowly.

#### WELWYN TO STEVENAGE.

At Welwyn bear to right at bottom of hill, then to left at church, and again to right a little further on to

Woolmer Green (2 m.), thence to Broadwater (2 $\frac{1}{4}$  m.) and Stevenage = 30 $\frac{1}{4}$  m.

Note.—Ascent and descent to Woolmer Green—1 in 16—rather dangerous. Between Woolmer Green and Broadwater, ascent and decent, 1 in 18 (caution).

#### STEVENAGE TO BALDOCK.

Take right-hand fork at end of Stevenage to Graveley (1 $\frac{1}{4}$  m.), thence past George IV. Inn to Baldock. = 36 miles.

Note.—Long ascent out of Stevenage, long descent entering Baldock.

Finishing point of outward journey, Rose and Crown Hotel.

### HOMeward JOURNEY.

From Baldock to Highgate: Reverse the route of outward journey. From Highgate turn to right through Fortress Road, Kentish Town, to Euston Road, thence via Pentonville Road, Pentonville Hill, "Angel" at Islington, Islington High Street, Liverpool Road to Barford Street entrance of Agricultural Hall.

## CRYSTAL PALACE MOTOR RACES.

**M**OTOR-TRICYCLE races will be held at the Crystal Palace to-morrow, Saturday, under the auspices of the Motor-Car Club. The following entries have been received:—

ONE MILE HANDICAP.—Chas. Jarrott, C. G. Wridgway, S. F. Edge, Hon. C. S. Rolls (scratch); J. W. Stocks, 50 yds.; E. J. Steele, 140 yds.; J. Buck, 175 yds.; M. Moyle, 175 yds.; M. Munn, 210 yds.; — Lewin, 210 yds.; W. Letts, 220 yds.; F. Eason, 230 yds.; G. White, 230 yds.; A. Goodwin, 250 yards.

FIVE MILES SCRATCH RACE FOR THE WELLINGTON CUP.—C. Jarrott, C. G. Wridgway, S. F. Edge, Hon. C. S. Rolls, J. W. Stocks, J. Buck, M. Moyle.

TWO MILES HANDICAP.—C. Jarrott, C. G. Wridgway, S. F. Edge, Hon. C. S. Rolls, scratch; J. W. Stocks, 125 yds.; E. J. Steele, 305 yds.; J. Buck, 375 yds.; M. Moyle, 375 yds.; W. Munn, 445 yds.; — Lewin, 445 yds.; W. Letts, 465 yds.; F. Eason, 485 yds.; G. White, 485 yds.; A. Goodwin, 525 yds.

MOTOR TANDEM RACE.—S. F. Edge and C. Jarrott v. C. G. Wridgway and J. W. Stocks.

THE CRYSTAL PALACE BRASSARD HUNDRED GUINEA CUP (the property of the Crystal Palace Company) ONE HOUR RACE.—C. Jarrott, C. G. Wridgway, S. F. Edge, Hon. C. S. Rolls, J. W. Stocks, J. Buck, M. Moyle

MESSRS. HEWETSONS, LTD., advise us that during the Richmond week not a single incident happened to their cars. The Nos. 1 and 2 Benz Ideals were used by over 100 persons in trial trips. The Benz van conveyed four of the staff to and from Highgate daily; and the 8-h.p. Benz brake, with ten persons up, and driven by Mr. E. J. Coles, carried over 500 passengers twice round the track.

## CORRESPONDENCE.

## HILL-CLIMBING CONTESTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the coming hill-climbing match between the Pennington car and the Mors car, it seems to me that whichever car wins it will not give any particular satisfaction to the ordinary motor-car user in this country, as I think what we would all like to see is a competition open to every type of motor-vehicle, and it seems possible for such a contest to be arranged in this country.

We are, through the laws of the country, prohibited from racing on the road, but why should we not hold an open hill-climbing test on some very steep gradient, preferably in Kent, such as Westerham Hill, so that it would not be very much trouble for French competitors to cross over, it only being a comparatively short drive from the coast to the scene of the competition.

I believe that such a competition, if arranged at a date suitable to some of the foreign *chaffeurs*, would prove highly interesting and most instructive to us all over here, as it is obvious that a vehicle that will climb hills fast will go fast on the level if a high gear is fitted.

The class of competition I would suggest would be to go up and down Westerham Hill, say, five times, and the time each car took for the ascent should be allowed for the descent.

If, however, it took longer to descend than it did to ascend, this amount of time should be counted against it in its total hill-climbing time.

The ascents and descents should, of course, be made one after the other until the five ascents have been completed, without any interval or stop between each.

I feel sure that a test of this sort, which could be witnessed by a large number of people, held on a Saturday afternoon, would create wonderful amusement.

Trusting you will think the matter of sufficient interest for insertion in your next issue,

London, W.C.,  
June 22nd, 1899.

Yours truly,  
S. F. EDGE.

## THE HEAVY WAGON TRIALS AT UXBRIDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the competitions for heavy vehicles recently held at Uxbridge under the auspices of the Automobile Club, I now beg to enclose a table setting out the results of the competing vehicles, including the second trial of the Bayley steam trolley, which was ordered by the judges who were under the impression that the results obtained in the first trial were too good to be true, and concluded that an error must have occurred by the official observer in measuring the fuel used.

The vehicle is constructed on the Straker system under the British Motor Patents, and its performance on the second trial represented the traction of  $3\frac{1}{2}$  tons of net load at an expense of 1.75 lb. coke per ton mile, and taking the coke at 15s. per ton is equivalent in money to 0.14d. per ton mile for fuel. This is an economy of more than 75 per cent. on any

practice yet deduced by competitive firms building self-propelling steam vehicles of the light locomotive type.

In sending you this letter I feel that the interesting result fully justifies my presuming upon your space.

Thanking you in anticipation,

I am yours faithfully,

SIDNEY STRAKER, A.M.I.C.E.

## NOTES FROM THE WORLD OVER.

It has been stated that a motor-car service has been organised on the Niger.

CAPTAIN CORDIER's motor fire engine seems to be working successfully in Paris.

THE Hon. C. S. Rolls is at present in Paris, but hopes to be at the Crystal Palace on Saturday.

WE understand that Messrs. Pope & Co., engineers, of Slough, intend commencing the manufacture of motor-cars.

ACCORDING to the general press, Edison is building an electric car that is guaranteed to travel 150 miles without re-charging.

THE Daimler Motoren Gesellschaft, of Canstatt, has made a net profit of 70,468 marks for the year ending March 31st.

DURING the meeting of the British Association at Dover, in September, it is proposed to hold an exhibition of motor-cars on the Dover Athletic Grounds.

At Richmond, on Monday last, Dr. Lehewess was summoned for furiously driving a Mors car, but the magistrates, not considering the case proved, dismissed it.

"My horse has reasoning powers, I tell you." "In what respect particularly?" "Well, instead of shying at that automobile cab he edged up to it and kicked it."

MR. HARRY MARKS, M.P., editor of the *Financial News*, and his secretary left London last Sunday in one of the Motor-Coupé Co.'s Victorias for a three weeks' trip in the West of England.

IN the Automobile Club's advertisement of the Show appeared an announcement regarding the racing between the horse and the tricycle, to the effect that the latter has been kindly lent by the British Motor Co.

MESSRS. MARCHANT & Co., mineral water manufacturers, of Bowen Street, Brisbane, write us that they are in correspondence with several English manufacturers with a view to utilising motor-vehicles for their business.

At Armley, near Leeds, last Saturday, a two miles invitation motor-cycle race was held. There were four entries, but only three starters, Mr. Winn ultimately coming in first by a lap and three-quarters ahead of Mr. Humphrey.

WE are advised that the Motor Manufacturing Co. not only were awarded a silver cup in the Automobile Club races last Saturday, but also were awarded a special silver medal for excellence in motors and motor-tricycles by the committee of judges acting on behalf of the Automobile Club.

HEAVY WAGON TRIALS, HELD AT UXBRIDGE—20 MILES—AUTOMOBILE CLUB.—JUNE 13TH, 1899.

## SCOTTISH NOTES.

### Show Awards.

THE duties of judges in any sort of competition or show are nearly always arduous and difficult, and in a show of automobiles with such a variety of types as were exhibited at Richmond last week the work of "judging" was no sinecure. It is usually impossible to please everybody, but from the information I gathered at the show on Friday last there appeared to be a very large amount of dissatisfaction with the awards made, as well as with the general management of the show, and I was assured by several important exhibitors that unless they could rely on better treatment at future shows the Automobile Club exhibitions would henceforth most certainly be boycotted. One reason to which considerable dissatisfaction in the awards was attributed was that in more than one instance the number of judges doing the work was an exceedingly small proportion of the judges who were advertised to act. No doubt the executive will take the lessons of their first show to heart and make amends in their next. So far as I could gather from those on the spot the impression seemed to be that the convenience of the only parties who made the show possible—viz., the exhibitors—was very much neglected, and in many cases their operations hampered by needless restrictions. A little more official consideration in this respect would have, I venture to think, much improved the number of entries in the various competitions and gymkhana. No doubt good has been done by the show, although the distance from London affected the attendance of the public.

### The Agricultural Hall Show.

FROM conversation with the various makers at last week's show, a much greater interest appeared to be centred in the show which opens at the Agricultural Hall, Islington, on Monday, July 3rd, and expectations of doing good business were higher. From the very complete arrangements this show promises to be a highly successful one in every respect, and many intending buyers are delaying their purchases until they see the exhibits there. Several Scottish friends I know of intend visiting this show to buy. Messrs. Stirling, of Hamilton, whose exhibits were so much admired last week, will, I believe, exhibit at the Agricultural Hall, as well as the Madelvic Motor-Carriage Co., Ltd., of Granton.

### Sober Drivers.

THE conviction last week of the driver of one of the large motor mail vans, now in use by the London Post Office for being the worse of drink while in charge of his vehicle raises again, as other similar cases have done, a very important question, viz.: the necessity for thoroughly steady drivers for self-propelled vehicles. It is obvious that although a canny-going cab horse may carry a half-drunk or intoxicated coachman home in safety, a motor-car, however "life-like," has no such instinct or qualities. Even a locomotive driver may safely run his train with a "glass" in his head, but it is quite different with a mechanical carriage without rails requiring a steersman. An essential quality in a motor-car driver, viz., sobriety, was, I understand, early insisted on by the pioneers of the motor industry in Scotland, and I believe that, so far as the drivers selected and trained at the Hamilton Works, are concerned, the men almost entirely are abstainers, and I am not aware that a single case of irregularity in this respect has ever occurred throughout Scotland. Those who are responsible for the selection and training of new drivers should make a point, as far as possible, of only accepting men who are abstainers, and I believe such men can readily be obtained.

### Scottish Motor Hiring Companies.

DURING the long spell of fine weather which we have experienced here, motor hiring companies in Scotland have all been doing good business. In some cases the business offered them has exceeded many times over their ability to undertake it. The moral, of course, is plain, and companies with capital are increasing their capacity as rapidly as possible.

### The Edinburgh Autocar Co., Ltd.

THE Edinburgh Autocar Co., Ltd., are now in possession of their large new premises in Lothian Road, and the beginning of July will mark an important increase in the number of their cars on the streets of Edinburgh. The Highland and Agricultural Show, at which H.R.H. the Prince of Wales will attend, should be a harvest time for this enterprising concern.

"BROWN HEATHER."

## MOTOR-CARS ON THE CONTINENT.

### A Wurtemberg Motor-Car Club.

THE formation of a Wurtemberg Motor-Car Club is now a *fait accompli*, a meeting having just been held at Stuttgart, when Herr Pfautach was elected first president and a committee appointed. Already forty-five members have been enrolled.

### A New German Motor-Car Company.

THE Allgemeine Betriebs Gesellschaft für Motorfahrzeuge is the title of a new company which has just been formed in Cologne to deal in auto-cars of all kinds, and to establish motor-car services for the conveyance of both passengers and goods. The Cologne Electrical Co. (Messrs. Louis Welter & Co.) is interested in the new company, which has a capital of £30,000.

### Another Motor-Car Race in Germany.

WE learn that the annual meeting of the German Touring Club is this year to be held at Mainz, from the 14th to the 20th July. An extensive programme of visits, cycle races, etc., is being arranged, and a new feature this year is the inclusion of a road race for motor-cars and cycles. The course is from Mainz to Finthen, Coblenz, and back, the distance out and home being about 150 miles.

### Import Duties on Motor-Cars in Norway.

ACCORDING to an official communication from Christiania, the Norwegian Customs authorities have just altered the classification "electric motor-cars for use on railways" to include automobile vehicles of all kinds. The import duty on such vehicles is at the rate of 15 öre per kilogram, or about 8s. 6d. per cwt.

### A Steam Road-Train Service in Italy.

WE learn from an Italian correspondent that a passenger road-train service has just been established between Ventimiglia, Liguria—on the Italian-French frontier—and Vievola in the Tenda Valley, the present termination of the railway system in that district. The train is of the Scotte type—well-known in France; it comprises a combination tractor and omnibus of 2.7 h.p., with accommodation for sixteen persons, and a trailing 'bus capable of accommodating twenty-four passengers. Trials of the train have just been made over the route in the presence of both government

and local authorities. On the outward journey between Ventimiglia and San Dalmazzo di Tenda, the distance—forty-three kilometres—was covered in six hours, the route being up hill all the way. The return journey was easily made at an average speed of fourteen kilometres per hour—the maximum allowed by the Italian authorities.

#### The Gordon-Bennett Challenge Cup.

MR. GORDON BENNETT has offered to the French Automobile Club a cup to be awarded to the winner of a race between four-wheel motor-vehicles, propelled either by petroleum spirit or electricity. The first race is to be run in France. It will be open to a member of any automobile club in any country to challenge the holder of the cup, which has been accepted by the committee of the French Automobile Club.

#### A New Motor-Tricycle Record.

M. C. TERRONT, an old-racing cyclist, has just created a new record by riding on a motor-tricycle from Paris to Brest and back, a distance of about 1,200 kilometres, in the net time of 40 h. 26 m. 4 s. Two other riders—Ducom and Corré—have already announced their intention of endeavouring to reduce the time over the same route.

#### Prospective Accumulator-Patent Litigation in America.

RUMOURS are rife of an impending storage-battery war in America. The General Carriage Co., which has the cheap cab charter in New York State, and which has imported from Paris two Krieger electric cabs, has under advisement the importation of a large number of them, to be put in service in New York. These cabs utilise storage batteries made by a French company, under patents claimed to antedate those of the Electric Vehicle Co., licencees of the Storage Battery Co. of Philadelphia, which sets up a claim to the ownership of every storage battery patent that is of any value in the United States. The Storage Battery Co. therefore, states the *Horseless Age*, threatens suit for infringement if the carriage company introduces Krieger cabs in the city.

## THE GYMKHANA AT THE AGRICULTURAL HALL.

**D**URING the progress of the Motor-Car Exhibition at the Agricultural Hall, Islington, popular interest will be excited by a series of competitions and displays in the arena. These will not only serve to attract public attention, but also to demonstrate how effectually motor-vehicles can be brought under the absolute control of their drivers.

Entries for the various events referred to below are now being received, and these are in sufficient number to lead to anticipations of a great success. The lists, however, are not yet closed, and intending entrants may intimate their intention of competing up to the morning of the day on which the events are brought off; but for the convenience of those concerned it is hoped that all entries will be received at the Agricultural Hall within the next three or four days.

### MOTOR-TRICYCLE CONTESTS.

For motor-tricycles there will be steering competitions through and around obstacles, figures, etc., over a specified course, and after that is covered each rider will be allowed to give an exhibition of skill on his own lines.

The electric-ignition motor-tricycle contests will be started with the machines from a dead point, heats being run each day. There will also be daily finals, the winners of

which will participate in the grand weekly final on Saturday. Those who win this latter event on the 8th prox. will run with the winners of the second Saturday's heats in the grand final match. From the rules, which should be carefully studied by competitors, we notice that on the signal to start being given the tank is to be filled with petrol and the lubricating chamber with lubricant—one pint of petrol and one measure of lubricant to be handed to each competitor on entering the ring, the whole of which must be placed, without spilling, in the proper receptacles.

There will be an interesting motor-tricycle emergency trial, in which the competitors will ride round the arena, dismount from their machines, take off both the hind wheels, and remount the right-hand wheel on the left axle and *vice versa*. They will then be expected to disconnect and remove the batteries from the box, subsequently replacing them, remounting and riding round the arena; the first home winning the heat.

The obstacle race for motor tricycles will be of a novel character so far as motoring is concerned in this country. The course will be twice round the arena. On the first round, two obstacles, each 12 in. high, will have to be overcome by the rider dismounting and lifting the machine over. At the end of the first lap each competitor will have again to remount and search for an egg bearing his own number from a basket containing at least three dozen eggs. This he will have to carry in his hand when remounting and lifting his machine over the obstacles on the second round. The first home will win the heat; but breaking the egg will disqualify equally as knocking over an obstacle.

As an exercise in patience, no less than as a demonstration of control, the skill in slow-driving motor tricycle contest should be interesting. The competitor who takes the longest time in traversing the track will be declared the winner. After once fairly started, pedals must not be used.

### BICYCLE AND MOTOR-TRICYCLE EVENTS.

For bicycles and motor-tricycles there will be similar events, the machines being, of course, in different classes. These will include heads and posts, lemon cutting, tilting at the ring, tent pegging, etc.; while another competition which should prove popular is as follows, classes for both bicycles and motor tricycles being arranged:—The entrant will ride round the arena, dismount and vault twice over his machine without permitting it to fall from its proper position. He will then run round the arena with the machine held only by the top bar of the frame, mount, and ride round the arena, the first home being the winner.

### MOTOR-CARRIAGES.

The motor-carriage competitions for tube ignition cars will be run in heats twice a week, the winners to ride in the final on the first Saturday and the grand final on the 15th prox. In this competition all the ignition tubes will, at the start, be removed from the cars—the wicks removed from burners; no pressure will be allowed in the tanks; india-rubber connections with the pump will be severed, and one chain is to be off the rear wheel. All parts are then to be replaced, the car started (methylated spirit being used in the burners), and run round the arena.

For electric ignition cars, with single-cylinder engines, and also for those with two or more cylinder motors, there will be similar competitions. At the start the sparking plug will have to be removed, the batteries disconnected, the lubricators empty, and one chain off the driving wheels.

Obstacle competitions will also be arranged for motor-cars and vehicles calculated to test the skill of the drivers.

The competition will, except where stated to the contrary, be carried out each day, with Saturday finals, and all entries should be addressed to Messrs. Cordingley & Co.'s office at the Hall, where competitors can obtain the fullest information as to awards, times of starting, and other conditions generally.

# A NEW FRENCH STEAM MOTOR-CARRIAGE.

THE illustrations, Fig. 1, 3, and 4, herewith show a new light steam motor-carriage which has lately been introduced in France, by the Société Européenne d'Automobiles of Paris. As will be seen, the carriage, which is built in accordance with the designs and patents of MM. Tatin & Tanière, is a light three-wheeled two-seated vehicle, its weight complete being only about 350 kilogrammes, or about

7½ cwt. The boiler, which is of the coiled tube flash type, is mounted on the fore splash-board (C, Fig. 3), while the engine M is mounted under the floor of the carriage. The feature of the boiler is that it is petroleum-fired. The oil is stored in a

FIG. 1.

cylindrical tank *v* (Fig. 3) underneath the seat of the carriage. To this tank a small air pump *n* is attached, by means of which a certain degree of pressure is obtained in the former, which forces the liquid out of the tank, and causes it to pass along the feed pipe *b* to the tubular vaporiser *B*, arranged under the steam-vaporising coil *S*. The vaporiser *B* terminates in four tubular nozzles, the ends of which communicate with four tubes leading into the

FIG. 2.

exhaust *C*. The water tank *L* is also located underneath the seat, and has a capacity sufficient, it is stated, for a run of from 80 to 120 kilometres, on a level road. From the tank *L* (Fig. 3) the water is pumped to the boiler by hand at starting, but automatically afterwards through a connection between the motor and the pump, this being so arranged that should the speed of the motor become excessive the

quantity of water allowed to pass to the boiler is automatically decreased. Both the petroleum and water feed pipes are provided with cocks, so that the supply of either may be shut off by the driver at any moment. The motor itself (*M*, Fig. 3) is of the horizontal double-acting type, without comprising any special feature.

As regards the transmission of the power from the crank-shaft to the rear road wheels, it will be seen from Fig. 4 that the shaft *A* carries at its ends two gear wheels *E* of different sizes, the vehicle being provided with two speeds. These wheels engage with corresponding gear wheels loosely mounted on an intermediary shaft *a*. Mounted on this shaft are two clutches (not shown in Fig. 4); the latter are connected to and controlled by the hand wheel *m* (Fig. 3), and are so fitted on the shaft that while revolving with it they are free to slide in and out of gear under the action of the hand wheel *m*. When one clutch is in gear the other is out, and *vice versa*, while with a point on the hand wheel *m* in a central position the motor is entirely put out of gear with the power-transmitting mechanism. From the shaft *a* the power

FIGS. 3 AND 4.

s transmitted through one chain and the sprocket wheels *Pp* to the right hand rear road wheel, which is mounted loosely on the rear axle, the use of a differential gear being in this way obviated. In addition to being able to throw the engine out of gear with the power-transmitting mechanism, the driver is provided with a foot pedal (*h*, Fig. 4), which controls brakes acting on both the rear wheels. The engine is also so arranged that it can be instantly reversed, a backward motion being in this way provided. The front wheel is mounted between forks similarly as in a bicycle, the steering being effected by means of a long bar (*f*, Fig. 3) brought within easy reach of the driver. The wheels are of the suspension type, and are fitted with pneumatic tires. The Société Européenne is also making a four-wheeled four-seated steam dog-cart, illustrated in Fig. 2, the boiler, engine, and transmission being identical with that above described. The weight of this vehicle is stated to be 450 kilogrammes, or nearly 9 cwt. The makers claim that a speed of 25 kilometres per hour can easily be attained by their vehicles.

ACCORDING to the New York correspondent of the *Morning Post* an Automobile Company has been formed in the State of New York, with a capital of 2,500,000 dols., to organise clubs in all the large cities, and to form them into an association on the lines of the League of American Wheelmen

### CROWDEN'S NEW STEAM BRAKE.

THE car shown in the accompanying illustration has been designed and made entirely by Mr. C. T. Crowden for experimental purposes, to ascertain what advantages a steam vehicle possesses over a petrol one, and also the h.p. most suitable for the work. The carriage at present is not fitted with change speed gear, but, having a compound engine, it will travel at a very high speed on the level, up inclines and steepish hills, and steam is easily maintained at working pressure. Mr. Crowden has now constructed an oil furnace which promises to give good results, as the intensity of the fire can be regulated at will, an advantage not to be obtained with coal or coke fuel. The frame is entirely of steel, with laminated steel springs, and long bolted mail-pattern axles, Crowden's patent motor-car wheels with

oak spokes, ash felloes, and rubber tires. The boiler is of the multitubular type, constructed to burn coke or oil, and fitted with improved automatic stoking arrangement. The engine is of the compound type, fitted with link motion and an intercepting valve by which high pressure steam can be used in the low pressure cylinder for starting and for climbing steep hills.

The car is fitted with a foot brake acting on a drum on the differential gear shaft, and a screw lever brake acting on both hind wheels, and both of these can be actuated from the driver's seat. The body, roof, and fittings of this vehicle have been made in Mr. Crowden's factory, and are constructed with the sound workmanship and high finish which is well known to characterise all his work, and the whole turn out is smart, serviceable, and highly creditable to the engineer who produced it.

### ONE HUNDRED SOVEREIGN CONTESTS FOR ELECTRIC CARRIAGES.

IN connection with the Commercial Efficiency Trials to be made during the next fortnight, special attention is directed to those for electrical carriages. The first (A) of these will be a distance test for electric carriages weighing under one ton and carrying two passengers, the route being from the Agricultural Hall to Maidenhead, at a minimum speed of 10 miles, the maximum to be 12 miles per hour. The second (B) of this series of competitions will be for electric carriages weighing under  $1\frac{1}{2}$  tons, and carrying four passengers, the same speeds to be adopted and the route from Westminster to Brighton. For each of these contests a prize of the value of £25 is offered. The carriages engaged in the

above contests are to be eligible for speed tests, using the same batteries recharged. This will be over any road with a gradient of not less than 10 per cent. on it, and the prizes will be of the same value as in the foregoing series, making £100 in all. The run will be as far as the competitors care to go, but it is a stipulation that the gradient shall be as stated. These competitions are called C and D for the 1-ton vehicle, and the  $1\frac{1}{2}$ -ton carriage respectively. The passengers carried must average a minimum of ten stone in weight in all four competitions.

### GOOD RUN BY AN ELECTRIC VEHICLE.

ON Wednesday, one of the Electrical Undertaking's, Ltd., cars, built on the Leitner system, ran from London to Brighton at an average speed of twelve miles an hour on one charge only. This was certified by an expert, Mr. M. K. Eyre, of Messrs. Duncan & Eyre, of New York. The same batteries had previously run over 500 miles under seal.

### PROPOSED MOTOR-CAR SERVICE AT HASTINGS.

At a meeting of the Hastings Town Council the Licensing Committee reported having "had before them an application from Mr. A. H. Collis, of Great Brington, Northampton, for licences to ply for hire here with wagonette and char-a-banc motor-carriages of the Daimler type. They have inspected, and certain of the members have travelled on, one of the char-a-banc carriages brought here by the applicant, and, having fully considered the matter, they now recommend that the number of licences to be issued for stage carriages of the wagonette and char-a-banc class which, by a resolution passed by the Council previous to the extension of the Borough was limited to twenty-five, be increased by twelve, making the total number to be issued thirty-seven, that the whole of the twelve additional licences be issued for motor-carriages, but that preference be given to local applicants for such licences."

Alderman Idenden moved the adoption of this report, and Councillor Shoesmith seconded.

Alderman Weston moved an amendment because he did not think the Committee had given the matter the consideration which it claimed. He did not think permission should be given for motor-cars to ply for hire here, and thus take away the living of a considerable number of ratepayers. This resolution had been passed simply because someone had come over from Brighton and said he had seen them there, but the speaker had heard from the Chief Constable at Brighton, and learnt that they had only one motor-car plying for hire. They should let the matter go back to the Licensing and Watch Committees jointly to consider the advisability of placing these cars in the town, and finding a stand for them. He had little objection to motor-cars as such, but he thought their introduction would injure the livelihood of a respectable class of men who had been ratepayers for many years.

Councillor Bray seconded the amendment, and said he agreed with Alderman Weston's remarks.

Alderman Idenden thought Alderman Weston rather hard for wishing to take away the Licensing Committee work, and place them under the Watch Committee. They had looked carefully into the matter, and as they did not feel altogether equal to deal with it, he thought it should go to the Council.

The Mayor: Do you ask permission to withdraw your motion?

Alderman Idenden assented, and on the amendment becoming the substantive motion, a further amendment, relegating the matter to the Council in Committee instead of the two Committees mentioned, was proposed by Councillor Smith and adopted.

### THOSE MOTOR CARS.

EDWARD LEHWESS, of 1, Princes Road, Holland Park Avenue, Notting Hill, was summoned for driving a motor-car, at Kew Bridge, on the 31st ult., at a greater rate than 12 miles an hour, contrary to the provisions of the Light Locomotives on Highways Order, 1896.—Police-Constable Cheeseman said at 8.30 on the evening of Wednesday, May 31st, he was at the foot of Kew Bridge, when he saw a motor-car coming over the bridge towards him. The machine was coming very fast, and at a rate of over 15 miles an hour. Just at that time there was a large number of pedestrians at the foot of the bridge, and on the approach of the motor-car they scuttled in all directions, and some shouted and screamed in trying to get out of the way. Witness himself had to step on one side as the motor passed, or he would have been knocked over. He held up his hand for defendant to stop, but he only slowed down, and went on at a rate of seven or eight miles an hour. Witness ran after the car, and catching hold of the brake jumped on. He again requested the defendant to stop, and seeing that witness was on the car he did so.—Mr. Lehwess said it was impossible for the car to go at the rate of speed mentioned by the constable.—The case was adjourned, on the application of the police, for further evidence.

On Monday it was again heard, when the magistrates, not considering the case proved, dismissed it.

# PETROLEUM MOTOR-VEHICLES.\*

By JAMES D. ROOTS, M.I.M.E.

(Concluded from p. 223.)

Taking the average of several of the best known petroleum spirit vehicles, the fuel cost per brake horse-power per mile per day is found

FIG. 40.

to be about six times greater than that of the author's petroleum oil vehicles.

Fig. 42 is a plan of the twin-cylinder 4-h.p. motor frame and wheels for either a two or four-seat body. *A* is the motor, *B* the valve and power shaft driven from the crank shaft by the two-to-one set of chain wheels *A*<sub>1</sub>. On *B* is keyed the chain wheel *C*, which conveys motion to the chain wheel *D* keyed to the countershaft *E*. *F* is the high-speed cone clutch with a chain wheel attached, *G* is the slow-speed clutch with its chain wheel. The chains on *F* and *G* drive direct to the chain wheels *H* and *I* on the axle tube *J*. *K* is the balance gear box. *L* is an ordinary jaw clutch, the corresponding jaws of which are fixed to the gear wheel *L*<sub>1</sub> of raw hide. *M* is a gear wheel always gearing with *L*<sub>1</sub>, and

FIG. 41.

having fixed to it a small chain wheel. *M* rotates upon a short shaft. The chain wheel of *M* drives the chain wheel *N*, which is keyed to the

tube of the axle. *O* is the water tank, *P* the cooling coil, *Q* the exhaust box; *R* is a rod, to the end of which the operating lever is attached. The

FIG. 42.

rod *R* in reciprocating moves the lever *S* which slides in either direction the outer cones of the clutches *F* *G* which are cast in one for this purpose. Another rod or link operates the reversing lever *T*, which brings into operation the pinions *L* and *M*. *Z* is the channel frame.

This vehicle carried about ten gallons of water, which was sufficient to last for about three hours, without changing; the time would vary a little according to the kind of road it met with. After the fourth hour the water would probably boil. The oil tank contained two gallons of oil, which would usually last from four to four and a half hours. Practically any kind of oil was usable, American or Russian, between specific gravity 79 to 84.5, and with a flash point from 73 F. to 150 F., Abel test. Two friction clutches are used to convey the power to the driving wheels, the one geared to 3½ miles an hour and the other to 10½ miles an hour. The clutches are cone-shaped and consist of two portions, one of which fits into and is pressed into the other with more or less force according to the speed required. If pressed in tightly, the clutch drives as one without slip; if less tightly the clutch will slip, and the slip being in accordance with the pressure, any speed between one mile and the maximum can be obtained with these clutches. A vehicle going at any given speed can be accurately followed. These clutches are now used on all Messrs. Roots and Venables' vehicles, as they allow so much range of speed.

Roots and Venables' van, propelled by a 6-h.p. motor, has been doing about thirty miles daily for some time past. It is intended to carry loads up to one ton. The maximum speed is ten miles an hour, while the slow-speed clutch gives four miles an hour, and the reverse is about three. The consumption of oil on a tested fifty-mile run of this van, everything being carefully arranged to obtain accuracy, was thirty-one pints. The van, fitted with a very heavy and solid body weighing 7½ cwt., carried a load of 15 cwt. The oil used was Tea Rose at 4½d. per gallon.\*

FIG. 43.

The cost of the fuel, therefore, for the run was 1s. 6d.; the cost of the lubricating oil for the run was 2d.; the total oil cost of the fifty-mile run was therefore 1s. 8d.

Fig. 43 is a plan showing the first design of transmission and other gear for the 6-h.p. vehicle for a van or other body. The motor *A* is fixed upon the front of the frame *Z*. The crank shaft *B* carries the bevel pinion *C*, which meshes with the bevel wheel *D*, which is keyed to

\* A paper read before the Society of Engineers, May 1st, 1899.

\* The price of oil has risen since, and is now about 5d.

the right-angle shaft *D*. The bevel wheel *E* is keyed at the other end of the shaft. The bevel wheel *E* drives the two mortise wheels *FG*, each having a friction clutch attached to it. *F* is the slow-speed clutch, *G* is the reversing clutch. *H* is the quick-speed clutch, having keyed to its inner cone a small chain wheel *J* on the countershaft *J*<sub>1</sub>, to which also *G* and *F* are attached. Two levers are employed, one to operate *H* or *F*, and one to reverse by means of *G*. *K* is the balance gear. *LL* are the chains driving the back wheels of the vehicle on the axle *M* by means of large chain wheels fixed to them. *N* is the front axle, *O* is the pulley for the band brake, and *P* is the water tank.

This design worked out heavier than was calculated and intended, and, although it was clear that the arrangement would be very suitable for a heavier vehicle of greater power, it was desired to reduce the total weight. Moreover, the bevel wheel *C*, running at 510 revolutions per minute, made considerable noise, and the following design was substituted for it.

FIG. 44.

Fig. 44 is a plan of the design adopted for the 6-h.p. vehicles, whether for carriages or vans. The chain wheel *C*, keyed to the crank shaft *B*, drove by means of the chain wheel *F* the inner cone of the clutch *F* for the slow speed. For the reverse the lower part of the chain *C* passes over the chain wheel *E*, which is cast in one with the chain wheel *E*<sub>1</sub> fixed to the short stationary rod or shaft *D*. As the lower part of the chain moves in the opposite direction, the chain wheels *E* and *E*<sub>1</sub> necessarily also rotate in the opposite direction, as also the chain wheel *G*<sub>1</sub>. If now the clutch *G* be thrown into driving friction the shaft *J*<sub>1</sub> is also reversed, and the vehicle moves at a slow speed backward, according to the number of teeth in the respective chain wheels. For the high speed the chain wheel *H*<sub>1</sub> is attached by a sleeve through the bearing to the clutch *H*, which when put in frictional gear drives, by means of the chain *I*, the chain wheel *J*, keyed to the shaft *J*<sub>1</sub>. The other reference letters apply as in Fig. 43.

FIG. 45.

Fig. 45 is a plan illustrating the mechanism of the author's most recent two-seated light car. This carriage has a motor of 2.2 brake horse-power and the arrangement of the transmission gear, the author thinks, has the fewest working parts of any petroleum car he has met with. *A* is the motor, *B* the water-cooling coil, *CC* water tanks, *D* oil tank, *E* quick speed clutch attached to the crank shaft *A*<sub>1</sub>, *F* slow speed clutch attached to the valve shaft *A*<sub>2</sub>, which is driven from the crank shaft *A*<sub>1</sub> by the chain and chain wheels *A*<sub>3</sub>, *G* large chain wheel on the axle driven by the slow-speed chain from the clutch *F*, *H* large chain wheel driven from the crank shaft clutch, *I* the balance gear box, *J* the axle, *K* the band brake operated by a foot lever, *L* rubber block tire brake, *M* the brake

lever, *N* the operating lever for both clutches, *O* the steering lever, *P* the exhaust box, and *Z* the frame.

It will be obvious to any one having any knowledge of motor-vehicles how advantageous in all ways this arrangement is. Its chief advantage is simplicity, the very minimum of working parts for a car. The quick speed drives direct from the crank shaft to the axle. Although there are only two clutches, any speed can be obtained with this arrangement, from one mile to the maximum. As there are so few parts, there is less likelihood of anything getting out of order. Other advantages are cheapness of manufacture and lightness of weight, the total weight of the car being only 4½ cwt. unloaded. The quick-speed clutch is set for twelve miles, and the slow speed for four miles, per hour.

Pneumatic tires of 2½ in. diameter, or preferably solid tires of 1½ in. width of rim, are fitted to the wheels, which are of the tension type. The front wheels are 28 in. diameter, and the back 32 in. There is only one operating lever for all speeds and for stopping. A considerable portion of the mechanism is made of malleable iron instead of cast iron, in order to reduce weight. This vehicle is driven by the same motor as shown in Fig. 18, but with various detail improvements to increase the power and to render it free from exhaust smoke or smell. It now gives 2.2 brake horse-power at 590 revolutions.

It must be remembered that in an absolutely new industry, as that of petroleum motor-vehicles was, a designer had no data to work upon, and everything practically had to be worked out *ab initio*. He had to calculate and consider about almost everything, to the smallest parts. Even the ball bearings had not only to be designed but also to be made by the author's firm. In the cycle trade as it is now various small parts of the machine, and indeed all the parts, may be purchased separately, and the whole machine put together by the purchaser. Of course, in those cases where a motor-vehicle was imported from abroad and had only to be copied the way was made smooth.

As the second living pioneer of this industry in this country (Mr. Butler was undoubtedly the first), and, as the author believes, the only early pioneer who has persevered, he has the satisfaction of having acquired all his own data, of having, as it were, been completely through the mill in obtaining his knowledge and experience of petroleum motor-vehicles. He has designed and worked out eight wholly different types of vehicle, and four different motors, with as many different kinds of transmission gear. The result of all this thought and labour is that the three vehicles last described, driven respectively by the 2 brake horse-power, 4 brake horse-power, and 6½ brake horse-power motors, are satisfactory commercial machines.

With regard to the vexed point of electric ignition and tube ignition, the author would observe that during 1885 he made numerous experiments with two forms of electric ignition upon a stationary spirit engine, viz., a battery and a magneto-electric machine. The ignition tube was also fitted to the same engine. Better results were always obtained with the tube than with either method of electric ignition. He, therefore, gave up electric ignition, and has always placed his trust in the tube, which he is still convinced has the balance of advantage in its favour. It must be conceded that electrical ignition generally is in a much improved condition to what it was at the time he experimented with it. Nevertheless, both are destined to be superseded in the immediate future by another system of ignition, which has all the advantages of both systems and some of its own. This method consists of the use of a small additional piston which fires a small quantity of the charge by compression prior to and separately from the main working charge, and admits it to the working cylinder at a predetermined time, which can be varied at will. This method of ignition is not, however, sufficiently perfected to be described further at present.

We understand that Mr. Reuben Thompson, of Sheffield, has decided to start a service of motor-omnibuses.

At the Paris Automobile Show there are just over four hundred exhibitors. We anticipate at least one hundred at the Motor-Car Exhibition at the Agricultural Hall, Islington. In Paris they have four bands playing at the same time in different parts of the ground, but the attendance, according to latest advices, has not been of the best. The novelties to Parisians have not been many, but an attraction is the section occupied by the Aero Club, the members challenging each other as to who can stay up in the air the longest.

"BEING in want of a motor-car for experimental purposes," says a writer in the *Leeds Mercury*, "I recently called at addresses where seventeen cars had been offered for sale, and, though it was within three days of the various advertisements appearing, only one car was to be seen, the other sixteen having changed hands at prices varying from £95 to £175 each. One advertiser showed me no less than thirteen replies to his advertisement." This experience is by no means exceptional, and demonstrates two things: Firstly, there is a demand for motor-cars, and secondly their sale can be ensured by advertisement.

## DAIMLER MOTOR CO., LTD.

A MEETING of the Daimler Motor Co., Ltd., was held on Wednesday at the Holborn Restaurant, in pursuance of the pledge given at the last general meeting that the shareholders should be informed at an early date as to the position of the company. Mr. E. H. Bayley (the chairman of the company) presided. The Secretary (Mr. John Ware) having read the notice convening the meeting,

The Chairman said: As you are aware, this is an informal meeting, called solely for the purpose of giving you information. When I was elected as chairman at the general meeting in January last, I stated that I would make a thorough and exhaustive investigation of the company's affairs and report to you at as early a date as possible, reserving to myself the right to retire from the position if I considered the position unsatisfactory. Sir Edward Jenkinson, who was elected a director immediately afterwards, gave, I believe, a similar promise, and it is in pursuance of these pledges that we have called you together to-day. Since our election we have attended a very large number of board and committee meetings, and between the meetings have had almost daily to deal with matters connected with the company. We have carried out many reforms, which shall be explained to you in detail. For myself, I may say at once that so far from considering the position unpromising, I am convinced that with the change of policy that has taken place, and with good business-like management, the company has not merely a satisfactory but even a brilliant future before it. (Applause.) In the remarks which I shall have to make I intend studiously to avoid personalities, and shall especially abstain from casting any reflection upon either our predecessors or other persons. Let the dead past bury its dead, and let us, as practical business men, devote our best attention to the future, and so make the Daimler Company what it can be made, a successful and dividend-paying concern. (Hear, hear.) The first duty to which we directed our attention was to cut down the expenditure to the lowest point compatible with efficiency. We found two staffs of clerks and officials, one in London and one in Coventry. This was a totally unnecessary expense, as neither staff was fully employed, and the divided responsibility created friction and prevented efficient management. We dispensed with the services of nearly all the London staff, at a saving of £623 per annum. The whole of the work is now done at Coventry, under the direct supervision of the secretary, and is done far more efficiently than before. The change has effected not only economy of money but economy of time. Under the old system, customers' letters could not be answered frequently for several days, in consequence of correspondence taking place between London and Coventry, whereas now letters, inquiries, etc., are promptly attended to. The bookkeeping is placed on a thoroughly sound footing, and everything works smoothly. To carry through this rather revolutionary change was a heavy undertaking, involving considerable labour at the time, as the whole work of the office had to be reorganised; but it has been done, and has proved a great success. The difficulty of the task was made all the greater by the resignations of the late secretary, the general manager, and the chief clerk. It is no easy matter at short notice to find the right men to fill responsible positions; but the right men have been found in this instance, and I can confidently assure the shareholders that the company has not suffered by the change. The organisation of the factory at Coventry has also been remodelled. There were too many overseers in proportion to the number of workmen. By a rearrangement of the work, we have saved £1,144 per annum in salaries, and although the work has increased and is still increasing, it is now more efficiently carried on than before. The practice of manufacturing for stock, and especially for stock that was not really saleable, has been stopped. The works are now fully occupied with profitable work as fast as men can be obtained. Unfortunately, 64 per cent. of the men were discharged towards the end of last year, and got scattered about the country, so that now, when we require them, it is difficult to get them back, as they are afraid that in the winter they will be discharged again. But they are gradually coming back, and I have no doubt that we shall be able to provide them with constant employment. While on the subject of officers, I may mention that we have retained the services of Mr. Sidney Straker as consulting engineer, and his services have proved invaluable. The success of this company will turn upon the quality of the carriages it produces. About a year before I joined this company I ventured to state in public that the motor-car industry had been chiefly handicapped in this country by the ill-designed and defective cars that had been placed upon the market. Every day's experience since that time has confirmed me in this opinion. A customer who has purchased a badly-designed motor, possibly at a high price, is not only annoyed by frequent breakdowns and the heavy cost of repairs, but a bad impression is created, and probably a dozen possible purchasers are deterred from buying. On the other hand, a well-designed and successful car will sell itself. I can give the meeting an illustration of this fact. Two omnibuses have been built under the Daimler patents, under the supervision of Mr. Straker and myself, and have proved an extraordinary success. One of them has run over 1,000 miles without the slightest hitch, at a cost of about 1d. per mile, which is a mere fraction of the cost of horse power, and what is the result? Arrangements have been made with your company for the construction of a large number of these carriages at a satisfactory profit, and my strong impression is that after they become known you will scarcely be able to cope with the orders you will receive. Bear in mind, gentlemen, that defective vehicles cost you more to build than well-designed ones. Unsuccessful carriages are built singly or in small numbers, and fresh drawings and patterns have to be constantly made and

the machines changed and the men taken from one job to another, so that no profit is made. When a successful carriage is built all the parts can be standardised, and the cost of production is greatly cheapened. The several parts are made in large quantities, and a profit is made where before there was a loss. Mr. Straker has completed the designs for two leading types which will probably form the backbone of the company's business, and when these types are standardised a large demand can be met and the carriages cheaply produced. You will be glad to hear that at the recent Automobile Show and Competition at Richmond the Daimler Company got more medals and certificates than any other exhibitor. In the hill-climbing competition we carried more weight per horse-power than any other maker, either French, German, or English. In the long-distance trials we carried the greatest number of passengers per horse-power with the smallest consumption per horse-power of fuel. Our four-seat car ran fifty miles with a consumption of only 1½ gallons of petrol, and the six-seated car ran the same distance with only 2½ gallons. The light two-seated car, to which our excellent works manager, Mr. Critchley, has devoted so much attention, was probably the most successful feature of the show. As a hill-climber, it carried three passengers against two passengers of other makers' cars. We have already received orders for twenty of these cars, which will no doubt be in great demand, and as this machine is now standardised a large number can be produced to advantage. It will be a satisfaction to the shareholders to learn that certain serious matters in dispute which had been allowed to drag on from year to year at considerable risk have been disposed of. The transaction connected with the unfortunate acquisition of Eel Pie Island has been finally closed. Another long outstanding dispute, involving a sum of nearly £3,000, has been met so far by the payment to the company of £1,800, and before long we shall recover the balance. Another disputed debt of £650 has been recovered, and arrangements have been made that similar disputes will not recur. A statement has recently been widely circulated by a late director that the company's affairs are in a chaotic condition, a statement that is not only fictitious, but distinctly libellous. This attempt to damage the company's credit is the more discreditable, as the writer must have known that the company's financial position was exceptionally sound. The sundry debtors are considerably in excess of the sundry creditors, and during the past six months the balance at the bank has varied from £2,000 in January to £7,800 at the present time. I have much pleasure in stating that Mr. Holt and Mr. Mace have loyally supported Sir Edward Jenkinson and myself in all the changes we have introduced, and the board, as at present constituted, works most harmoniously. (Applause.) New life and energy appear to prevail among the employés, and I feel the greatest confidence in assuring you that if favoured with your continued support we shall be able, with patience and perseverance, to make this company a decided financial success. (Applause.)

Mr. Heap said the chairman had referred to motor-cars for the carriage of people. He wished to know whether the company made motors for the carriage of goods also, as there would be a great demand for these in a very short time.

The Chairman replied that they made carriages of all descriptions; but he thought experience had shown that for the carriage of very heavy loads of from three to six tons steam was better than oil. Perhaps for light goods petrol machines were the best, and during the last three months they had been devoting their attention to getting out a design of a motor-car especially for the carriage of goods to the extent of, say, one or two tons in weight. The drawings were now practically completed, and he felt sure that before long they would put something of the kind on the market which would have a very large sale. He was convinced that the new design would beat anything that could be done in the way of electricity.

Mr. Harvey George wished to know whether the chairman's remark that steam was more applicable to the carriage of heavy weights applied to char-a-bancs and such vehicles, because he thought that was one thing that ought to be pushed forward. Some two years ago he applied to the company with a view to starting such char-a-bancs at Great Yarmouth, where he lived; but he had great difficulty in getting anything suitable. He hoped the company would do something in this direction, as he believed that class of carriage would be very much in demand.

The Chairman replied that when he spoke as between light and heavy weights he called light weights those that carried passengers up to two tons. When they came to three, four, or five tons they get into the domain of steam. For the purposes named by Mr. George—namely, char-a-bancs, the company's petrol machines were the very thing.

Mr. George: How many would they carry?

The Chairman: The vehicle I referred to in my remarks carries 26 persons and goes 10 or 12 miles an hour without the slightest difficulty. Char-a-bancs are child's play to us. One of the machines I referred to is specially adapted for such a purpose. In regard to anything in the way of passenger traffic, we shall be at the very top of the tree.

Sir Edward Jenkinson said they were still in not exactly a transition state, but a state in which a great deal more inquiry was necessary in order to get the books on a proper footing. They had amalgamated the London and Coventry offices, and had now one set of books. He proposed to go carefully into the question of the prime cost, the incidence of the prime cost on their dead charges, and the question, therefore, of prices and profits, and until they got the whole of these matters into proper order—although they were in a good state financially—it would be impossible for anyone to give an accurate statement of the value of what the company possessed, what the cost of their work was, and therefore what the profit was. He hoped that by the time they brought forward the accounts, which would be for fifteen months, in October or November

next, the directors might be able to lay before the shareholders, quite independently of the figures in the balance-sheet, a statement which would satisfy them as to the actual condition of affairs with regard to the manufactory, and as to the profits they were deriving and might expect to derive from the work being turned out there.

Mr. Sturmev, who said he had sent out a circular giving a few solid facts connected with the business, remarked that the chairman had made a statement which, on the face of it, sounded very pretty. He could echo the opinion of the chairman on one point, and that was that thanks were due to Sir Edward Jenkinson for the way in which he had gone into the question of the book-keeping and so on, and he was quite prepared to say things were to-day in a somewhat better condition than they were two months ago; but what he had to complain about was that when the new board came in they absolutely ignored the knowledge of those who were already in the company and had a good deal of experience of the business. The result had been that for at least four out of the past six months the affairs of the company were in a chaotic state. He would give one fact to show the condition of the company to-day as compared with last year. In the first six months of last year they manufactured about 100 cars; in the six months expiring this week they had manufactured 37. The chairman had stated that they had a good bank balance. This was quite true, but what was the use of a big balance if they did nothing with it? If, instead of carefully hoarding that bank balance and admiring it, the board had increased the productive capacity of the company, and produced cars which would have been sold, they would have done some good with their money. By reason of the policy which had been pursued he calculated that they had lost a profit of something like £5,000, which they might well have earned if they had used the resources of the company. Besides having that £5,000 profit, they would have had fifty or sixty more cars running and doing good for the company. The treatment of the staff by one member of the new board had practically resulted in the whole of the staff interested in the selling business resigning, and, instead of doing anything to remedy that, they went on for several weeks in a condition which resulted in only one order being brought into the place. He (the speaker) had resigned his position on the board, and did not wish to have anything more to do with the management, but he protested against the way in which the new board had muddled the affairs of the company in four months out of the six. What had been done recently had, as he had said, been owing to an entire reversal of their policy of the first four months and by taking Mr. Critchley into their confidence, and making him practically general manager as well as works manager. That was the explanation of the improved state of things recently, and this had not been brought about by the members of the board, with the sole exception of Sir Edward Jenkinson, who, with Mr. Critchley, could pull the company through. Mr. Sturmev concluded by saying, "If you throw the rest of the board overboard it will only be so much lumber that will go by the board." (Laughter.)

The Chairman said Mr. Sturmev stated that the new directors had ignored him in regard to their policy. His impression was that he was put on the board for the very purpose of ignoring the policy of the previous board. (Hear, hear) He thought they had carried out their programme, and they would continue to do so. There had been no reversal of their policy whatever. From the date they were elected to the present time they had pursued the same policy, and it was absurd to say there had been any reversal. No doubt Mr. Sturmev felt a little sore at having been thrown overboard himself. He (the chairman) had before him full extracts from the minutes referring to Mr. Sturmev. He did not propose to read these now, because they had not called the meeting to go into personalities, but if he read them he felt sure the shareholders would not listen to anything more that Mr. Sturmev might have to say at any time.

Sir Edward Jenkinson said they had never at any moment been without an efficient salesman in London, and what Mr. Sturmev had said on that subject was not correct. As to the delay and the loss owing to that delay, he acknowledged that harm had resulted from this. But why was there any delay? What caused it? It was as well to go to the root of the matter. Last year work was stopped and hands were got rid of at a very critical time. A committee of investigation was appointed, and at such a time everything in a company was disorganised. Things were bound to come almost to a standstill. All their best men were turned away from the factory, which was working half-time, and although he admitted that while he was learning the details of the business there was delay, he denied that it was so great as Mr. Sturmev had alleged. When they were in a position to put pressure upon Mr. Critchley to get the establishment into full working order they were told over and over again that they could not get the men back. They had a great deal more work than could be done by the hands in the factory, and it was their greatest difficulty to get the full number of good hands back again. It must be by degrees that the men would return. Owing to the boom in engineering business they came back very slowly, but they expected more would return in the autumn. He must object to being dissociated from the rest of the board by Mr. Sturmev, as they were working together with perfect harmony and were thoroughly agreed as to the policy which should be pursued. (Applause.)

Mr. F. L. Rawson said that, as the shareholder who pressed Sir Edward Jenkinson to go on the board, he thought he ought to thank that gentleman for having done so. The only criticism offered by Mr. Sturmev which appeared to be well grounded was as to the delay that had taken place. Well, he (the speaker) was very pleased that the new board had not gone ahead at once, but had allowed matters to quiet down while the reorganisation was going on. When a new board went ahead immediately without having a thorough grasp of the business and its

details mistakes were often made which could not afterwards be easily rectified, and he was therefore pleased that the board had pursued the policy which they had done. It was important that the public, the company's employes, and the trade should know that they were a united company, and he would therefore move a vote of confidence in the present board of directors. (Applause.)

Mr. Harvey George seconded the motion, which was carried unanimously, and, the Chairman having briefly acknowledged the compliment, the proceedings terminated.—*Financial News*

## BEDFORD MOTOR-CAR SYNDICATE, LTD.

A GENERAL meeting of shareholders was held at the registered offices of the Syndicate, Bedford, recently, Mr. Paul Wyatt, Chairman of the Syndicate, presiding. A general statement of working expenses and receipts was shown, and the Chairman made a statement with regard to the experimental character of the business up to date, pointing out that as pioneers they had to pay the cost of their position, but there was no doubt that the cars were wanted and the Syndicate had wisely anticipated this fact. The public had largely patronised the cars, and there was no doubt the demand was constantly growing. The purchase of another car, so as to meet the requirements of pleasure parties, was considered. There was no rivalry with any other means of conveyance, for there was room for both cars and omnibuses. The shareholders present expressed themselves as well satisfied with the results as shown by the directors, and a vote of thanks was passed to the Secretary, Mr. G. C. Walker.

## FURIOUS DRIVING AT LEICESTER.

At the Leicester County Police Court, William Nash, motor-car driver, was summoned for driving a motor-car at a greater speed than twelve miles an hour, contrary to the County Council bye-laws. Police-Constable Harding deposed to seeing defendant driving a car down Taylor's Hill, on the Ashby Road, at a pace which witness considered was over eighteen miles an hour. For the defence, it was contended that the pace was not more than thirteen miles an hour. The Act of Parliament allowed motor-cars to be driven at fourteen miles an hour. The Chairman said that whilst that was so the Act also gave local authorities power to issue regulations with reference to the pace at which cars could be driven. A fine of 15s., including costs, was imposed, with the alternative of seven days.

## BICYCLE v. MOTOR-CAR.

RECENTLY two youths named Hillier and Fellinder hired a tandem bicycle at Calne, which they rode as far as the Wagon and Horses at Quemerford, when they met a motor-car coming in the opposite direction round Blacklands Corner. The boys were on their proper side of the road, but from the position of the car they thought they would be safer on the other side, and in attempting to cross they came into violent collision with the car, which is the property of Mr. Lily, Bristol. As was to be expected, the bicycle had the worst of it, and the whole of the front part was considerably damaged. The boys, who were thrown into the road, were much bruised and shaken. The only damage to the car was the breaking of the lamp and the scratching of the splash-board.

At the West London Police Court, on Saturday, Mr. Van Toll was fined 10s. and 2s. costs for alleged furious driving.

A NEW firm has just been formed in Paris (13 Rue Lafitte) under the style of Ernst & Co., to deal in motor-vehicles of all kinds.

THE German military authorities have decided to again use a number of motor-cars at the autumn manœuvres for the conveyance of baggage, ammunition, etc.

THE young gentleman who writes the leading article for one of the cycling papers says there is not the slightest doubt that the speed of motor-cars in the country not only exceeds fourteen miles per hour, but double, even treble this speed is indulged in!

THE capital of the Société Lyonnaise des Velocipedes et Automobiles, Rochet et Schneider, of Lyons, France, is being increased from £20,000 to £40,000. At the same time the title of the Company is being changed to La Société Lyonnaise de Construction d'Automobiles, Rochet et Schneider.

## 1,000 MILES ON A MOTOR-CAR.

**A** FORTNIGHT ago, says the *Eastern Counties Press*, we reported an unique holiday-making excursion, in which a Norwich resident (Mr. E. O. Adcock, of the Uplands, Eaton) and several members of his family took part. The party started on the 6th inst., *en route* for Criccieth, North Wales, and on the 21st they arrived in Norwich safe and sound, being loud in their praises of the motor as a means of touring. Some details of this novel fifteen days' excursion may be interesting. The carriage which was chartered by the party was a motor-wagonette, and was driven by the owner, Mr. H. Watts, of Yarmouth, of whose skilful and careful management the members of the party cannot speak too highly. During the journey of a thousand miles, which included trips to the most picturesque districts of North Wales, not a hitch occurred, whilst the motor's power as a hill-climber was demonstrated over and over again. It may be stated that on the journey across England the tourists, reached Nottingham at the close of the first day, spent the second night at Chester, and made Carnarvon their stopping place on the third night, thence proceeding to Criccieths which was their head-quarters.

On the return journey they took a different route, passing through Shrewsbury, Wolverhampton, Birmingham, Coventry, Market Harborough, Peterborough, and thence to Downham Market and Swaffham. Needless to say, the trip proved of a most pleasant and varied character, the fine weather adding much to its interest and enjoyment. In many districts of North Wales the advent of the motor created quite a sensation among the natives, who seemed to imagine that a part of a railway train had got loose. The apparition caused many villagers to stand speechless in astonishment, and then to seek the shelter of their cottages in a hurry; whilst in several of the small towns, where the market was being held, all the market folks left their stalls to watch the motor making its way through the main street. As we have said, the most hilly roads were successfully negotiated, and the party traversed Llanberis Pass and other beautiful spots. The only change of conveyance in which the travellers indulged was a railway trip up Snowdon.

## A YARMOUTH DRIVER FINED.

At Yarmouth Police Court the Chief Constable said he was on the Parade on Monday afternoon when he saw a car, driven by young Bertie Miller, dashing along the North Parade at a rate of from ten to twelve miles an hour. He waited for its return, and it was then travelling a full twelve miles an hour. There were hundreds of people about at the time, and such a speed on the Drive was most dangerous. The defendant, he added, had been cautioned several times before about furious driving. Mr. Clowes, who defended Miller—summoned for furiously driving the motor-car to the common danger of the public—asked the Chief Constable how he estimated the speed. The Chief replied that there was a smart trotting pony in a gig coming along the Drive at the time at seven or eight miles an hour, and the motor-car travelled up from behind, swished past, and left the gig behind in a moment. Mr. Clowes: Was he travelling at a really dangerous speed?—The Chief Constable: Yes, certainly. What do you call dangerous?—Well, I should call three miles an hour dangerous in some parts of the town—at the corner of Regent and King Streets for instance. Are you aware that even when this car is travelling at the rate of eight or ten miles an hour, it can be pulled up in half its own length?—I have heard it said so.

Inspector Hardesty corroborated the evidence of his Superintendent, saying he thought that, with so many thousands of people about on the Drive as there were that afternoon, the speed of the car was very dangerous.

The defendant, in the witness box, said that between the Aquarium and the Wellington Pier he only drove at the rate of five or six miles an hour. Beyond the Wellington Pier he increased his speed. The car was completely under control, and even at full speed (fourteen miles an hour) could be stopped dead in five yards. Travelling at seven or eight miles an hour, he could pull up in two or three yards—less than the length of the machine. No horse and cart could be stopped so easily and effectually. Defendant produced a certificate of ability as a motor-car driver, saying he had spent three-and-a-half months with the manufacturers of this particular car, which cost nearly £400.

Mr. Clowes urged that if the driver had no control over the machine the Chief Constable would have had very good grounds for proceeding against him; but he could stop the car in a moment if necessary, and was a careful, cautious driver. The newest motor-cars were far safer than an

ordinary horse and cab, and he only wished some of the magistrates would go and examine them closely, so as to realise the wonderful perfection of their mechanism.—The Chairman: I think I know as much about motor-cars as you do, Mr. Clowes.—Mr. Clowes: They have only just come to the town, sir.—The Chairman: But I have examined motor-cars two years ago.—Mr. Clowes: But cars of this type were not constructed then. The cars of that period are quite clumsy and obsolete to-day. They used either to break down or run away. But this is one of the very best and latest type. It was not going faster than you are entitled to drive a horse or ride a bicycle, and it can be pulled up much quicker than you can stop a horse.—The Chairman: That is only an assumption.—Mr. Clowes: I am entitled to suggest assumptions just as the Chief Constable has suggested them. He only assumes the car was travelling at ten or twelve miles an hour; he doesn't know it for a fact, and I defy any man to tell the speed at which one of these cars or an ordinary bicycle is moving. The bicycles of the present day, with their high gears, do fourteen miles an hour on the Drive without being noticed by the police.—The Chairman: This is not a question of the rate at which the car was going, but of whether it was going at such a speed as to endanger life and limb. The Chief Constable and Inspector Hardesty think it was.—Mr. Clowes: And we think it was not. If we were driving wilfully to the public danger, we should have been culpable. But Miller knew exactly what he was doing, and he knew exactly to what extent he could control his car, and knew that there was not the slightest danger to anyone. It is not suggested that he was not taking proper precautions. Some dear old ladies might be frightened, perhaps, but that is all. It is simple tyranny if this car is going to be pulled up by the police when they choose to think it dangerous. The driver of the car knows when there is danger and when there is not, and he regulates his speed accordingly. There would be danger in driving the car through the crowded Market Place on Saturday night at five or six miles an hour, I agree, but there was no danger in the speed of nine or ten miles an hour on the Parade, the broadest thoroughfare in the town, in the middle of the afternoon.

The magistrates, however, decided that it was dangerous, and fined defendant 10s. including costs. At the same time the Chairman warned him to be very cautious in future, saying it had been reported to him that he was not such a careful driver as he professed to be.

## GUINNESS'S CAR IN TROUBLE.

At the Northern Police Court, Dublin, before Mr. Mahony, two men named Bernard Finnegan and David Axon were charged with having been drunk whilst in charge of a motor-car belonging to Messrs. Guinness's Brewery on the North Circular Road, on the evening of the 19th instant, about seven o'clock.

The Sergeant deposed that in consequence of information which he received he went to the railway bridge, North Circular Road, and there found a damaged motor-car, and the prisoners endeavouring to repair it. Both of them were so drunk that they were falling against each other. He caused them to be brought to the station-house and there charged them with being drunk. The motor-car had collided with the footpath, and a third man, who had been on it, was thrown off and injured so much that he had to be taken to the Mater Hospital.

Constables 14 D, 87 D, 98 D, and 44 D were examined, and all swore that the prisoners were drunk. Sergeant 30 D, who took the charge against the prisoners at the station, stated that Finnegan asked him to send for a doctor to say whether they were drunk or not, but he replied that it was unnecessary. Cross-examined: A gentleman came from Guinness's offices to see them when they were locked up, but he was not allowed to see them.

For the defence, Mr. Fitzgibbon examined Mr. W. Smith, of the engineering department of the brewery, who deposed that the prisoners were being taught to work the motor-car, which was used for the delivery of porter. Finnegan was chosen as the best man they had to send with the car and the other man was sent by the Motor Company to instruct the drivers. Mr. W. Bearnes, another official in the brewery, deposed that when the prisoners were going out with the car at five o'clock with a load which they were to take to Finglas they were perfectly sober. Two other gentlemen employed in the brewery deposed that they saw the accused men after the accident and both were perfectly sober.

Mr. Fitzgibbon, in reply to the Court, said the accident occurred through the motor-car getting caught in the tram track and running against the kerbstone of the pathway.

Mr. Mahony asked did Mr. Fitzgibbon wish to have the evidence of the injured man? Mr. Fitzgibbon said he did not.

Both of the accused men were examined, and swore that they had only taken two drinks of porter.

Mr. Mahony said he was satisfied they had had more they said, and fined each £1 or 14 days imprisonment.

THE Municipal Council of Paris has, it appears, hit upon the very best method for supplying a very long-felt want. An electric motor watering-cart has been invented, which seems to be perfection in its way. The vehicle has been experimented with on the Place de l'Hotel de Ville, and answers its purpose admirably. It is provided with a large tank, from which the water is ejected, not in a stream, but in a fine spray, and with a mechanical brushing apparatus.

## A RUNNING DOWN CASE.

—8—

At the Windsor County Court, before his Honour Sir A. G. Marten, Q.C., Mr. Harry Heatly, of 110 Cannon Street, W.C., civil engineer, sued Mr. J. R. Seaton, of the George Hotel, Aylesbury, farmer and hotel proprietor. The action was for damages sustained by the plaintiff in consequence, it was alleged, of the negligent driving of defendant or his servant. Mr. G. M. Cohn, instructed by Mr. Staplee Firth, appeared for Mr. Heatly, and Mr. Moyses, instructed by Messrs. Parrot, appeared for Mr. Seaton. On April 5th last Mr. Heatly was driving his motor-car from Oxford to London accompanied by his wife. On the main road between Taplow and Slough Mr. Heatly in his car was met by defendant's carter, Davis, who was driving a heavy wagon laden with empties and had two horses harnessed tandem fashion. When the vehicles were about fifty yards from one another Mr. Heatly noticed the leading horse of defendant then crossing the road towards the car. Mr. Heatly stopped his car, shouted to the driver to stop his horses, and at the same time stopped the engine in his car, which was thus motionless and noiseless. The horse advanced diagonally and did not appear to be under control of the defendant's carter. Mr. Heatly and his wife got out of the car, and the leading horse passing on the near side of the car entangled its traces in the wheels, and despite Mr. Heatly's exertions to free the machine it was dragged some little distance along the road and eventually forced under the wheels of the dray and completely smashed, the defendant's carter stating that he could not stop his horses. These facts were established by the evidence of Mr. and Mrs. Heatly and a man named Thomas Gregory, who was passing at the time.

The defendant contended that the horses were frightened by the motor-car, and that Mr. Heatly was an unskilful driver and ran his motor-car into defendant's wagon after the horses had swerved.

His Honour, in summing up, instructed the jury that if they thought the collision was an occurrence which could not be prevented by the use of the ordinary means of control with regard to horses then it would be an accident for which no damages could be recovered; but that if they found the defendant had been negligent in allowing a heavy cart of this kind to be sent out tandem position with only one driver, or that defendant's servant was negligently driving or had not proper and ordinary control of his horses, there should be a verdict for the plaintiff.

The jury retired, and on their return gave a verdict for plaintiff for £43 damages, and his Honour gave judgment for that amount with costs.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**FOR SALE.**—Electric Victoria, quite new, made by Thrupp and Maberly of London, the motor by Immish & Co.; in first-class condition. Price £200. For further particulars and order to view apply to C. A. Goffin, Minehead, Ouseley Road, Baham, S.W.

**FOR SALE.**—Mytholm Motor-Car, double cylinder, 3-h.p. petrol motor, three speeds, ball bearings, rubber tires, £110. Photo, three stamps. Also 8-h.p. two-cylinder Mytholm Petrol Motor, complete with tube ignition and carburettor, £55. 3-h.p. two-cylinder Mytholm Petrol Motor, £32.—Brown & Buckton, Hipperholme, Halifax.

**WANTED to Hire,** by a Dental Practitioner in Ireland, a small Motor-Car or Tricycle, suitable for two persons. De Dion preferred.—Apply Box 101, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**MOTOR-CARRIAGES,** deliverable directly, system Panhard, Benz, Peugeot, Mors, Decauville, Cambier, Rochet, Silmeldier; tricycles.—Apply to Géo. de la Nézière, 51 rue Vivienne, Paris.

**FOR SALE.**—Beeston Motor-Tricycle, almost new; owner going in for Motor-Car. Will accept £55.—Nesham, 25 Bright Street, Middlesbrough.

**FOR SALE.**—Benz 5-h.p. Dog-Cart, nearly new; written guarantee given as to condition; many improvements added.—Price and full particulars to Box 72, *The Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**BOLLÉE,** in good order, £60; Motor-Tricycle, tube ignition, £50. Both fast machines.—Owner, 83 Cautsfield Street, Liverpool.

**FOR SALE.**—Benz Ideal Car, only used a few weeks. Can be seen by appointment.—A. Clark, Soham.

**REV. ARUNDELL WHATTON** offers splendid Daimler Marseilles Phaeton, in thorough going order and excellent condition. Luncheon basket, clock, extra screw brake. £290.—16 Montpelier Square, Knightsbridge.

**1899 BEESTON QUADRICYCLE,** for two riders, Dunlop tires, almost new, having been ridden only about 100 miles; good reason for selling; bargain.—Prince, 198 Stretford Road, Manchester.

**WANTED.**—Trailer to carry one or two. State age, weight, and make.—Bernard, 101 Goldhawk Road, Shepherd's Bush, W.

**FOR SALE.**—Four-seated Benz Dog-cart, in excellent order. 5½-h.p. motor. Price £160.—Box 36, *Motor Car Journal*, 39-40 Shoe Lane, London, E.C.

**FOR SALE AS BARGAINS.**—Two Bollées and three De Dion Tricycles, all new, fast machines. Inspection invited. Platinum Tubes and Accessories always in stock.—Motor Agency Co., Ryley Street, Coventry.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**PLATINUM.**—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 24

**LARGE STOCK** of Motor-Car Tricycle Frames, with all latest improvements; two band brakes, cased-in pattern axle, free chain, hubs and pedals, and all connections ready to attach to motor; electric connection in handle-bar; highly enamelled and plated.—Brown Brothers, Ltd., Great Eastern Street, London, E.C.

**MOTORS ON HIRE.**—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

**ELECTRICAL EQUIPMENT FOR MOTORS.**—Improved Dry Cells, Accumulators, Special Transformer Coils, Ignition Plugs, Flexible Wire Connections, etc. General Accessories, wholesale and retail.—J. Burns, 44 Berners Street, London, W.

**AGENCY.**—Royal Lancashire Agricultural Show, Liverpool, August 3rd.—Wanted, Charge of Exhibits; fully experienced; can drive, and would act as agents.—The Syren Motor Co., 101 Smithdown Road, Liverpool.

**WORKING DRAWINGS AND TRACINGS EXECUTED.**—Apply, stating terms and wants, to D. 691, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, JULY 7th, 1899.

[No. 18.]

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

### Our Recent Issues.

OUR recent issues have been devoted to a large extent to exhibition matters and, we are afraid, have not been as interesting as novel; but it is impossible for us in our pages to ignore exhibitions, and there is no doubt they are doing a great amount of good to the industry by familiarising the British public with the wonderful possibilities of motor-cars. The opportunities of trial rides have been largely taken advantage of, and people once having tasted the pleasures of riding are likely to become converts, and possibly purchasers in the future.

### Our Exhibition.

OUR Exhibition at the Agricultural Hall, like most exhibitions, opened in a very incomplete state, but gradually improved as the week went on. The attendance on Monday, fortunately, was quiet, but became better each day, until on Wednesday there were large crowds of people. The business done by exhibitors seems so far to have satisfied them, and it is not unreasonable for us to suppose will improve. One or two French exhibitors are present, although De Dion's and other foreign firms' machines had not arrived at the time of going to press. We are, however, assured they were despatched last Wednesday week, and should have arrived earlier.

### The Arena.

THE arena has been largely taken advantage of both by petrol and electrical vehicles, and, excepting the turning over of a car and the buckling of a wheel through travelling at excessive speed, no accidents have happened. The sports have been much appreciated, and considering that everyone is new to the business, they have been found exciting and entertaining. The "Balaclava Melée" between men of the 1st London Engineers and motor cyclists has caused much amusement. These sports take place every evening between 7.30 and 9 o'clock, the band playing at the same time.

### Motor-Car Competition in America.

THE Automobile Co. of America, through its president, Mr. A. L. Barber, has announced that on the 20th inst. a competitive automobile test will be made. The winner of the competition will receive a prize of £400. Each machine will be graded on a scale of 175 points, distributed thus: Speed, 20; safety, 20; ease of backing and guiding, 20; power to climb grades, 20; cost of power, 20; low selling price, 20; light and graceful appearance, 15; strength and durability, 10; management easily learned, 10; fuel obtainable everywhere, 10; absence of disagreeable odours, 10. The carriages will start from the City Hall in New York at 9 o'clock in the morning, and will come to a

full stop at each corner until they reach Fifty-ninth Street and the Boulevard, where their arrival will be timed. From Fifty-ninth Street to the south end of Washington Bridge the carriages will move without racing. At the latter point the race for speed will begin. The carriages will move *via* Broadway to the south entrance of the private park of Mr. Henry Villard, thence *via* Mr. Villard's park back to Broadway, thence to Ardsley on the Hudson or to Irvington. At the conclusion of the course the committee will require such tests as they may deem proper. The competition will be international in character, and each firm will be entitled to enter three vehicles.

### Motor-Cars for Day Trips.

THERE should be a good opening for motor-cars in catering for the day excursions of small parties, and such a development only needs a spirit of enterprise to secure success. Messrs. Olley & Co., of Enfield, have a 5-h.p. motor-car which recently conveyed a party from Enfield to Cambridge, the outward journey being *via* Epping and Bishops Stortford. The distance, 52 miles, was easily covered between 7.30 and noon; and the return journey *via* Braughing, which commenced at 3.45, was exceedingly pleasant until a thunderstorm drove the occupants of the car to shelter at Cheshunt. Home was reached at 9 o'clock, the excursionists being loud in their praises of the smooth running of the car.

### Coach Builders and the Motor-Car Trade.

WRITING on motor-car shows, the *Carriage Builders' Journal* (which really should not write "motocar") advises members of the carriage building trades not to neglect attendance. "It is absolutely nonsensical," says our contemporary, "to belittle or neglect the tendency of the public to prefer motor-cars to horse-drawn vehicles, and it is mischievous in the extreme to allow the idea to get abroad that carriage builders are not the right men to supply or construct the motor-cars." Certain it is that the Show at the Agricultural Hall has been visited by many of the leading carriage builders of the country, and a great many more are expected next week.

### The Automobile Club.

For a long time past it has been known that the rate of subscription to the Automobile Club of Great Britain has been insufficient to enable the committee to make both ends meet, and a number of members have been of opinion that the amount should be largely increased. Hence we are pleased with the official information that "In accordance with powers given by the general meeting of members early in this year, the club committee have decided to raise the subscription and entrance fee for membership of the Automobile Club to four guineas and two guineas, respectively for members elected on and after October 1st next who may have addresses within the Metropolitan and

City Police area. The subscription for country members elected on and after the above date will remain at three guineas, and entrance fee at one guinea."

#### An Opportunity for English Firms.

IN the last issue to hand of the *Horseless Age* of New York appears a letter from the National Cash Register Co. of Dayton, Ohio, U.S.A., asking if there can be had, at the present time, a horseless vehicle that can transport loads of two to three tons at a speed of six to eight miles an hour. The Company is not particular as to the motive power, whether electricity, steam or explosive engine.

#### Newcastle Enterprise.

WITH regard to an article on "Motor-Cars in Newcastle," we understand there are three companies in the field and that each of them has placed orders with English firms for *chairs-a-bancs*, etc. At all events, three firms have had representatives during the week in the North, and we have been informed each firm has obtained orders. Already people are writing to the papers suggesting routes for the vehicles, and complaints are also being made that more routes are not included.

#### Our Courtyard.

THE Barford Street entrance of the Agricultural Hall, Islington, has been taken full advantage of by many owners of motor-cars, and at times there have been as many as thirty cars in the yard. For the privilege of storing the cars no charge is made, and every facility is given to private owners for the use of the arena. The London Motor-Van and Wagon Co. up to Wednesday night had not their vehicles ready; but on Thursday several cars were in use, and carrying passengers outside the Hall for a trip.

### SCOTTISH NOTES.

#### The Prince at Edinburgh.

THE event of the week in Scotland has been the visit of H.R.H. the Prince of Wales to Edinburgh during the Highland and Agricultural Society's Show, which opened on Tuesday, July 4th. Edinburgh has been *en fete* for the whole week, and thousands of people from all parts of the country have found their way here. There seems little natural connection between a great agricultural meeting—exhibiting the finest specimens of cattle of all breeds and classes, and the best in the way of fine "horse flesh"—and the mechanical vehicle to the interests of which this Journal is devoted. Yet the occasion of this Show has given thousands of well-to-do people from all quarters an opportunity of experiencing, in most cases for the first time, the comfort and pleasure of motor-car driving. Everywhere the motor-car was in evidence, and the smart fleet of cars owned by the Edinburgh Autocar Co., Ltd., was taxed to its utmost capacity. A regular service between the city and the show ground was established, with the result that this Company's revenue for the week must be a record one. The number of cars placed on the streets of Edinburgh this week by this concern has, I understand, been increased to twelve or thirteen. The Company, I am informed, have adopted a special style of painting by which their cars will be recognised, viz., bodies of dark blue lined in gold, with wheels and under-carriage of coach red, lined out in black. The new cars are all of the wagonette type, which has already been so successful in Edinburgh. It was the intention of some of the Scottish motor-car makers to have important exhibits at the Highland Show, and this would doubtless have been done but for the more important Motor-Car Exhibition now on at the Agricultural Hall, London.

#### Scottish Cars at Islington.

I WAS pleased to observe on my arrival at the Agricultural Hall this week that the Scottish pioneers were well to the front in their exhibits there also. In addition to one or two carriages which came in for so much favourable comment at Richmond, other new cars fitted with standard Daimler motors are shown by Messrs. Stirling. One I noted in particular—a Stirling-Daimler wagonette to seat six persons—simple in style, at a moderate price. A handsome steam omnibus, seated for twenty passengers, is also shown, and is creating a good deal of interest. The bus looks a very serviceable vehicle, and one which should be inspected by all who are interested in motor-car public services. Besides these some three or four new Pennington cars are shown, and a Pennington tricycle is in almost constant employment on the track. After the numerous unavoidable delays in getting the first batch of these new machines out of the factory it is pleasing to see that these pretty little carriages are getting about, and from reliable information which I have obtained the very numerous persons who placed their orders some months ago will not have many more weeks to wait before they are in possession of their cars.

#### The Scottish Club.

FROM enquiry I learn that a meeting in connection with the proposed Club will be called after the close of the London Show.

#### Aberdeen Again.

ABERDEEN has long talked of motor-cars and motor-car services, and so many syndicates have been promised for the purpose that I have become rather sceptical of reports of this nature which emanate from the Granite City. I may, however, say that a movement is at present on foot to establish without delay a motor-hiring business. If well managed it should prove successful, for I believe the field is a good one.

#### Some Show Results.

THE shows which have and are taking place in London in connection with the motor-car movement have very clearly made public the fact that the right people are taking to the new mode of locomotion in very considerable numbers, and I have no doubt that when once the fashion has set in and the output of the factories is increased, this country will not long lag behind the gay Parisians, with whom motor-caring has long been a craze. Another thing which these functions have shown is the genuine interest manifested by two old and conservative trades. The job-master has now awakened to the importance of the impending changes in his line of business, and was to be seen at both Richmond and the Agricultural Hall; and the coach builder, who has from time immemorial worked on the same lines, and with almost the same methods, and who until recently regarded the mechanical carriage movement with contempt, is also waking up and preparing to set his place in order to take part in the movement, and he, too, was prominent at the shows. These symptoms are more important than at first sight appear, and plainly indicate the growing strength of the movement and the rapidity with which it will one day spread. To produce perfection in the motor-carriage a combination of engineer and coach builder is necessary, and I flatter myself that this was first recognized in Scotland.

#### Glasgow Fair.

WITH the approach of the great annual holiday in the West of Scotland, motor-car hirers at the popular seaside resorts are preparing for a harvest, which, although short, is usually substantial, and only fine weather is required to cheer the hearts and fill the pockets of hirers.

"BROWN HEATHER."

## MIDLAND MOTOR NOTES.

By "VERAX."

A Coventry  
"Decauville."

MR. WEST, of Foleshill, who is doing a great deal in the way of experimenting with motors and motor-cars, purchased one of the three-speed Decauville cars at the late Show, and with a view of thoroughly testing the capabilities of the vehicle I drove it for a couple of days, most of the time with three men up. There is no doubt that for elegance of design and general appearance these little cars leave nothing to be desired, and they are certainly comfortable to ride in for two people, the only drawback being the very noisy gear wheels, and the trouble in changing these; one very bad fault in the construction being the necessity, when changing from the first to second speed, of passing the third speed gear wheels. This seems to me to cause needless wear and noise. The gear is practically of the three-speed Panhard type, and everyone is fully aware that the greatest trouble with this class of gear is the probability of damaging the fast-running cogs when changing from one speed to another. The motor itself runs very well as long as it does not get overheated, which is highly probable, as there is no water-cooling arrangement, and one cylinder is behind the other so that only one cylinder gets the benefit of the "breeze." The engine is practically a two cylinder De Dion, but differs from that engine in the firing arrangement. Two coils are used, with ordinary vibrators, and the primary current for these is switched on and off by a couple of contact springs worked by cams on the half-speed shaft. The ignition plugs, too, are of a very neat type, which is an improvement on the De Dion plug. On the central wire of the plug is fixed a pointed arm which terminates about one-sixteenth of an inch from a circular "ring," within which it is capable of revolving. This allows for wear or corrosion, or possibly fusing, and if there is no spark in one position a slight turn of the brass terminal on the one side of the plug allows it to be formed in another. The car proved itself a speedy little vehicle, and covers the ground well. The starting arrangement, too, is very neat indeed, and acts with great precision, so that a temporary stop for shopping or a short visit to a friend does not necessitate any more trouble when over than just taking one's seat, giving the starting wheel a couple of turns, throwing in the gear and sailing away. Ordinary speed regulation in traffic is easily effected by using the mixture valve, which has the effect of immediately reducing or increasing speed as the case may be, although this can be done, but not quite so readily, by using the throttle valve, as in the Benz type of car. One very notable feature of the car is the method of suspension. There are no springs proper on the rear axle, but the front axle is supported by a transverse spring which allows plenty of movement, and which, when the car is running, is in work all the time. This combined with the spring seat makes the car a very comfortable one to travel in. With a view to reducing the noise, Mr. West is making some composite gear wheels, which while having the necessary strength will provide fibre teeth, which should absolutely reduce noise to a minimum. As a hill-climber the car does very well, and carries three persons up a good steep hill, although the low gear gives a speed of nearly eight miles on the level. Altogether the Decauville takes a lot of beating for cars of the light description; but the price seems very high, though there is a lot of work put into the car.

Birmingham.

I PAID a flying visit to Birmingham a few days ago, but motor matters in that city progress very slowly, and no one appears to be really doing much work, and the one or two capitalists

I met seem very diffident of going into the business at present. At the same time one would expect to see more progress in the Midland metropolis. A large

building close to the hospital is the Motor and Cycle Club, but as far as I could ascertain there are no signs of motor-cars there, and beyond a few show-rooms and offices let to machine tool dealers and cycle factors, the place presents at first sight a deserted appearance.

The Crowden  
Steam Brake.

ON Monday of this week I saw this car, which has been referred to at length in your columns, on its way to the station for embarkation to London, where, I understand, it is to be exhibited at the Agricultural Hall. The brake has certainly a neat appearance, and is undoubtedly of good workmanship; it will no doubt attract much attention. It was in tow of a Daimler motor when I saw it, as it was presumably not worth while to get up steam for the short run from the motor works to the station.

THE new syndicate which has purchased a controlling interest in the Daimler Manufacturing Co., Steinway, L. I., U.S.A., will make a speciality of heavy-work vehicles, including brewery and coal wagons.

It is reported on good authority that the Columbia Electric Vehicle Co., of Hartford, Conn., is negotiating for the purchase of the plant of the New Haven Carriage Co., New Haven, Conn., who have been building carriage bodies for them for several years.

ONE of the attractions at the Agricultural Hall Exhibition has been the Phébus stand, and, as our readers are aware, the Phébus is one of the most speedy of the several vehicles of the motor-tricycle type. Mr. Frank F. Wellington, of 58 Rosslyn Hill, Hampstead, we learn, has been appointed agent for London and the South of England.

A SERIOUS accident has happened, according to the *Oxford Journal*, to Mr. George Vallis, of Marston, who is in the employ of Mr. Ernest Underhill, grocer, of St. Clement's, as foreman porter. It appears that Mr. Vallis left his employer's shop on his cycle to go to breakfast, being preceded by a motor-car. Vallis followed behind the car until the turning into Marston Road had been reached, when Mr. Coxeter suddenly turned the motor-car round. Vallis, in trying to avoid a collision, curved round in Cherwell Street; but unfortunately the car struck his back wheel, and he was thrown with some force under the motor, where he remained three or four minutes before he was extricated from his dangerous position. Vallis's right shoulder was dislocated, both knees badly cut, and his forehead and one side of his head much abraded, and he was much shaken. The back wheel of the bicycle was smashed and the machine damaged in other parts.

AT Ledbury, Mr. Frederick Ballard, Chairman of the Parish Council of Colwall, near Malvern, was charged under the bye-laws of the Herefordshire County Council with using a locomotive on the highway at Colwall on June 20th, without a licence. It was contended for the defence that no licence was required for the vehicle, which was a motor-car. Superintendent Phillips said what he objected to was that the vehicle emitted smoke and steam along the highway. It was not a motor-car. Police-Constable Thomas, of Colwall, said that he saw the vehicle being driven along the road, and it was emitting a great quantity of smoke and steam. He gave a description of the vehicle and observed that it made a noise like a traction engine, but he could not say it was a traction engine. Mr. Foster, addressing the Bench for the defence, said supposing that the vehicle emitted smoke or steam that contingency was provided for in the Act of Parliament, as an exception had been provided for temporary and accidental cases. The Bench decided to convict, and imposed a fine of £1. Notice of appeal was given.

# Motor-Car Exhibition at Agricultural Hall.

THE Motor-Car Exhibition at the Agricultural Hall in "merrie Islington" is now in progress, having been opened on Monday last. Each day has seen a steadily increasing stream of visitors, until by Wednesday the public interest was demonstrated in the crowded state of the hall. Some English and French firms have been late in arriving, but the outlook for next week is most promising, and all are anticipating a busy time. The entertainments provided each evening, some account of which has already appeared in these columns, have been much appreciated, while the presence of an efficient band has added to the enjoyment of the spectators and exhibitors alike. Several excursions from leading provincial centres are being run next week, and the interest which has been growing during the last few days should culminate in a very successful *finale* on Saturday week; although those anxious to examine the many types of vehicles shown should not delay their visit till the last day. The arrangements with regard to the Court Yard in Barford Street have been generally regarded as satisfactory, and the commencement of the various "Commercial Efficiency" trials on Monday next, at 10 a.m., is being anticipated with eagerness by many of the leading motor-carists and makers. The arena has been, and will be, a centre of popular interest, the Pennington and other cars demonstrating their possibilities therein at frequent intervals.

## THE EXHIBITS.

### [FIRST NOTICE.]

In a recent issue we expressed the opinion that however divided ideas may be as to the relative progress being made by builders of light motor-vehicles in this country as compared with Continental competitors, there can be no doubt that in one department at least—that of heavy steam-driven cars—English firms are rapidly taking the lead. If any proof of this fact be needed it is to be found in the large steam 'bus (Fig. 1) exhibited by the Liquid Fuel Engineering Company, of East Cowes, Isle of Wight. It is unnecessary to enter into a

FIG. 1.—THE LIQUID FUEL CO.'S FRENCH OMNIBUS.

lengthy description of the boiler, engine, and transmission gear of this vehicle, which are now fairly well known, and which were described at length in *Industries and Iron*, November 25th, 1898. Suffice it to say that the boiler is of the water-tube type, is oil-fired, and is located in the fore part of the vehicle. The engines are of the horizontal compound reversing type of 45 h.p. The 'bus, which is finished in

handsome style, is arranged to accommodate twenty-eight passengers, twelve on top and sixteen inside. The interior is divided into two separate compartments, first and third class, with different entrances. Baggage to the extent of 10 cwt. can also be carried on the roof. Tanks for containing about eighty-eight gallons of water are arranged under the seats, while about forty-six gallons of oil for firing purposes can be stored in tanks arranged on the frame, under the floor of the

FIG. 2.—THE LIQUID FUEL CO.'S STEAM WAGONETTE.

'bus. The vehicle is, we understand, one of an order for four, and intended for a French company for service between Hyères and Toulon. The Liquid Fuel Co. also exhibit their well-known 14-seated steam wagonette (Fig. 2) and a steam lorry to carry from four to five tons. A specimen of their shielded rubber-tired wheels for heavy vehicles is also displayed. The wheel has a steel tire, above which is a layer of rubber, above which again is a steel rim built up in separate segments; the makers claiming that the arrangement reduces vibration, and also the tendency to slipping and skidding.

The Steam Carriage and Wagon Co., Ltd., of Homefield, Chiswick, London, W., exhibit a steam lorry intended to carry a load of three tons, and to haul a further three tons on a trailer, built on Thornycroft's system. The boiler, which is of the Thornycroft water-tube type, is located in the fore part of the vehicle; it is coal-fired, although it can be adapted for liquid fuel firing if desired. The heating surface is 65 square feet, the grate area  $2\frac{1}{2}$  square feet, the test pressure 350 lb. per square inch, and the working pressure 180 lb. The engine, which is of the horizontal compound type, is entirely enclosed in a dust-tight casing, the moving parts working in an oil bath. Provision is made for the carrying of coal sufficient for a run of fifty miles, or of water sufficient for about fifteen miles. The tare weight of the vehicle is 2 tons 18 cwt. This vehicle is fitted with a new power transmission mechanism, of which we are able to give but few particulars. From a cursory inspection, however, we gathered that the rear axle, which is a compound one, is driven by spur wheels. The rear road wheels are mounted loosely on the solid axle, and are driven through the medium of springs attached both to the hubs of the wheels and to the hollow axle surrounding the solid one. A two-speed gear is provided, with the low one of which it is stated that a gradient of 1 in 6 has been climbed. At the recent trials at Richmond a vehicle of this type maintained an average speed of 5.4 miles per hour, over a twenty-miles course, at an average expenditure for fuel of 1.055d. per mile.

Messrs. Bayleys, Ltd., of Newington Causeway, Southwark, S.E., exhibit a petroleum-spirit motor-omnibus (Fig. 3) capable of seating twenty-six passengers. In fact the body is similar to the 'buses used in London, but is mounted on a channel-iron frame, to which the motor and transmission gear is mounted. The motor which is located in front is on the Panhard system, comprises four cylinders, and is stated to be capable of working up to 12 h.p. The power is transmitted through bevel gearing to a counter-shaft at the rear,

FIG. 3.—MESSRS. BAYLEY'S PETROLEUM-SPIRIT MOTOR-OMNIBUS.

and from the latter to the rear road wheels through pinions gearing with internal-toothed rings bolted to the road wheels. Three forward speeds ranging from five miles up to fourteen miles per hour, and one backward motion are provided. Steering is effected through the front wheels by means of a hand wheel. Three brakes are provided, two band brakes acting on the hubs of the rear road wheels, and a band brake working on a drum on the motor-shaft, which is automatically applied by the throwing out of the friction clutch.

Messrs. Bayleys, Ltd., also exhibit the steam trolley which took part in the recent trials, a tip-wagon body having been in the meantime substituted. This vehicle is a veritable combination of parts, comprising a De Dion water-tube boiler, a Straker motor, and a transmission mechanism very similar to that employed on the Daimler petroleum-spirit cars. The vehicle is stated to weigh, unladen, 58 cwt., and to be designed to carry a load of four tons. The De Dion boiler, which is coke-fired, is located in the fore part of the vehicle. The engine, which is of the vertical compound type, is arranged under the driver's seat; it is stated to indicate 20 h.p., the normal speed being 500 revolutions per minute. The shaft of the motor extends from the front right to the rear of the car, where the power is transmitted through bevel gearing to an intermediary shaft. The latter carries at its ends small pinions, which gear with internally-toothed rings bolted to the rear road wheels. A variable speed gear is provided, and it is stated that the wagon can attain any desired speed from two to seven miles per hour. The road wheels are strongly built and dished. Ample brake-power is provided, there being a shoe brake acting on a drum on the motor shaft, and band brakes on each of the internally-toothed rings connected to the rear road wheels. The result of a twenty-mile test of this wagon was given in our last issue.

The Crowds Accumulator Syndicate, Ltd., of Bridge Place, Eccleston Square, London, S.W., exhibit their "Crowds" accumulator, for which it is claimed that it has a capacity of 10 watt-hours per lb. of cell. The sheet lead used for the grids is of a specially pure quality, containing no antimony. It is passed through a press and cut and stamped to shape, the resulting grid having the appearance of expanded metal. The grid so obtained is very light, and bends under its own weight, the idea of this being that it is considered there is no advantage in making the grids so strong as to last longer than the active material they are incorporated with.

In assembling an element each plate is wrapped in a sheet of absorbent pulp or cellulose, and separators of perforated insulating material are then placed between each positive and negative plate. The whole is then placed within an ebonite box and the electrolyte added. The cellulose wrappers absorb the liquid, causing the former to swell, with the result that the plates are firmly held within the cell, and all chance of the active material washing away from the plates prevented. The cell is fitted with a light-fitting rubber cover, through which the poles project, and in the middle of the cover is a screwed cap for examination and filling. Connection between adjacent cells is made by a flexible stranded copper wire having brass collars and well insulated. The accumulator is being made in a number of sizes ranging from 100 ampère-hour up to 240 ampère-hour capacity. The following are the details of the 100 ampère-hour cell, the internal resistance of which is given as .008 ohm: Dimensions of box outside, 5 $\frac{3}{4}$  in. by 3 $\frac{7}{8}$  in. by 8 $\frac{1}{2}$  in.; total weight of complete cell, 14 lb.; height over all, 9 $\frac{7}{8}$  in.; available capacity at 10 ampères, 100 ampère-hours; 15 ampères, 90 ampère-hours; 20 ampères, 85 ampère-hours. We understand that the Crowds cell has already been adopted by a number of electrical motor-car builders in this country, including the Electric Motive Power Company, Balham, the Electric Street Car Manufacturing Syndicate, Wolverhampton, and the Madelvic Company of Granton.

The Electrical Undertakings, Ltd., of Miller Street, High Street, Camden Town, N.W., are attracting attention by their exhibit of a new type of electrical vehicle, which is built on Leitner's system. Five vehicles are shown, a four-seated sporting trap (Fig. 4), three two-seated buggies, and a phaeton (Fig. 5). Two electro-motors, of the Lundell type, and of 2 $\frac{1}{2}$  h.p. each, are provided—one to each of the rear road wheels—the connection being by means of spur-wheels on the motor shafts gearing with internally-toothed rings on the rear road wheels. The controller is adapted to give no less than six forward speeds, ranging from two to twenty-eight miles per hour and two backward motions. The motor is so arranged that in

FIG. 4.—THE ELECTRICAL UNDERTAKINGS', LTD., FOUR-WHEELED DOG-CART.

descending hills it can be reversed and employed in recharging the batteries. The battery consists of forty Leitner-type cells, the capacity of which, in the buggy, is given as 10,000 watt-hours at fifteen ampères discharge rate, corresponding to eight to ten miles per hour, while the weight of the battery is about 400 lb. In the sporting trap the battery weighs about 800 lb., while the capacity is given as 20,000 watt-hours, at twenty-five ampères discharge rate. Considerable attention has been devoted to these cars owing to the fact that one of

FIG. 5.—THE ELECTRICAL UNDERTAKINGS', LTD., PHÆTON.

them ran last week from London to Brighton at an average speed of twelve miles per hour, on one charge only, a record which the Company hope to beat in the early future. The total weight of the cars ranges from about 15 cwt. in the case of the buggy, to about 20 cwt. for the sporting trap.

The Mackenzie Carriage Works, of 26 Walnut Tree Walk, Kennington Road, Lambeth, S.E., exhibit three electrical cars—a Riker two-seated mail phaeton, a Mackenzie four-seated sporting dog-cart, and a Mackenzie three-seated phaeton. The frame of the Riker car is built up of steel tubing. The electro-motor is of  $1\frac{1}{2}$  h.p.; it is arranged in front of the rear axle, which it drives by means of spur gearing. The electrical energy is furnished by a battery of forty Headland accumulators of a capacity of 90 ampère-hours. The wheels are of the suspension type fitted with pneumatic tires, the weight of the car complete being  $18\frac{3}{4}$  cwt. Three forward and two backward speeds are provided. The Mackenzie dog-cart is built very much on Riker lines, but shows a number of detail improvements both in the carriage body design and in the mechanical arrangement. The frame is tubular, the connecting rods controlling the steering of the front wheels being of an improved design. The electro-motor, which in this case is of 3 h.p., is geared by means of spur wheels to the rear axle, a band brake operated by a foot pedal being incorporated with the spur wheel on the latter. The battery consists of forty cells of the "Victoria" type, of a capacity of 150 ampère-hours, or sufficient for, it is claimed, a run of sixty miles on one charge, the weight of the battery being 10 cwt. Three forward speeds—the maximum being twelve miles per hour—are provided, these being controlled by a single handle. The weight of this car complete is 23 cwt. The Mackenzie phaeton is of a very neat design, the electrical gear being the same type as the dog-cart with the exception that the motor is only of  $1\frac{1}{2}$  h.p., while the accumulators are of the "H. and H." type.

Messrs. Shippey Bros., Ltd., 13 King Street, Cheapside, London, E.C., have a large display of motor and electrical accessories of all kinds for electrical motor-vehicles, chief among which is a 2-kilowatt 80-volt electro-motor with fixed carbon brushes as used in automobile vehicles on the Riker system, and a 3-h.p. 75-volt "Paragon" four-pole motor. Other exhibits comprise a Riker standard controller-switch giving three forward-speed and two reverse motions, "Monarch" accumulators, a spark coil battery, switches and cut-outs for

motor-cars, ventilating fan sets, gongs, bells, etc., all of interest to builders and users of electrical cars, but to which pressure on our space forbids a lengthy reference at the present time.

Le Carbone (late Lacombe & Cie.), of Levallois-Perret, Paris, and 36 Lime Street, London, E.C., have an interesting display of electric accessories for use in connection with motor-carriages. Chief among them may be mentioned the "Sans-pareil" dry battery for use with the ignition apparatus of petroleum-spirit motors on carriages, yachts, tricycles, bicycles, etc. It is claimed for these cells that they give the maximum output for the minimum of weight and dimensions. The cells offered for tricycles, with suitable coils, will last between 300 and 500 working hours, according to the conditions in which they are employed. A special set is also now being made for bicycles. Another exhibit is to be found in the Rossel coils, which are specially wound and arranged for ignition apparatus on gas and oil motors. The advantages claimed over the coils hitherto employed are that they take a very small current and can be relied upon to give a spark at the desired interval without failing, while they can be run with dry batteries. Le Carbone Co. also makes a speciality of carbon brushes. It is claimed that the most successful carbon brushes yet offered are those made of X carbon, which is produced in electric furnaces under the Girard & Street patents. Its conductivity is double that of other carbon, and brushes made from it will, it is claimed, carry currents up to 16 ampères per square centimetre of surface contact, which allows for the reduction of commutators.

Mr. J. H. H. Berkeley, of Throgmorton House, Cophthall Avenue, E.C., shows a one-seated electric carriage, which takes the form of a bath chair, the motor being enclosed in a case at the rear. The electrical energy is stored in a small battery of 14 Sherrin cells arranged under the seat, one charge being sufficient for a run of about 20 miles. The switch is arranged to give any desired speed up to a maximum of about 9 or 10 miles per hour, a reverse motion being also provided. For simplicity this little vehicle would be hard to beat, there being only two small handles—one for varying the speed and one for a reverse motion—to control, in addition to the steering handle. We understand that a four-seated electrical Victoria and another vehicle will be on view at this stand in the course of a day or so.

An exhibition on which a large amount of interest is being centred is that of Messrs. Pennington & Baines, of 5 and 6 Great Winchester Street, London, E.C., and Manchester. A large display of the Pennington cars is made, including several types, prominent among which are a "Universal" four-seated car and a new Pennington-Stirling car. Fig. 6. The latter is an attractive-looking vehicle, the car body being of varnished walnut, upholstered in brown cloth to match, and fitted with a hood. The Pennington motor is mounted under the floor of the vehicle, the fly-wheel being fixed horizontally. Some alteration in the driving gear appears to have been made since the writer last inspected a Pennington car—the motor driving a horizontal pulley at the rear by means of a light cycle chain, the pulley being now connected to the front wheel axle by a belt in place of a rope as formerly. The road wheels are of the suspension type, shod with pneumatic tires; the rear wheels are the steerers, and are controlled by a handle at the side of the car. Another feature of the Pennington car is that no carburettor is employed in connection with the motor, the oil being fed directly into the explosion chamber, passing on its way through the exhaust silencer and so receiving a preliminary

FIG. 6.—THE NEW PENNINGTON-STIRLING CAR.

heating. Although the use of a carburettor is avoided, it is claimed that not only is perfect combustion secured, but every drop of oil is utilised, and the maximum power is developed from the amount of the hydro-carbon consumed. The cylinder is fitted with both a water-jacket and radial discs, attention being drawn to the small amount of cooling water required to be carried. As the centre of gravity of the car is only some eight inches from the ground, and the wheel-base being long, it is almost impossible to upset the car; indeed, the stability is so great that the car can, it is stated, be swung round in a narrow road when going at its top speed. Besides the positive speeds obtained by changing the gears, two of which are provided, any intermediate speed can be got by the regulation of the oil supply, the oil being passed to the motor from the tank in which it is stored through a needle valve, and a quarter-turn of the valve handle, conveniently placed within reach of the driver's hand, will decrease or increase the oil supply, and the result on the motor is instantaneous. The entire motor and its mechanism, with the horizontal fly-wheel, is placed below the level of the framework, and consequently the carriage-builder finds no obstacle in the way, but has

free scope for the exercise of his skill in getting out a commodious and elegant super-structure; in fact, different types of bodies can be fitted on the same frame. For instance, a tradesman can have a parcels delivery van fitted on his motor frame, and through the week the motor can be used for trade purposes; and at the week end the van body can, by means of a pulley and block attached to the roof of the carriage house, be slung up, and a neat pleasure carriage body substituted—the whole change taking but a few minutes. The "Universal" car is fitted with a single-cylinder motor, by means of which a maximum speed of sixteen miles per hour can be attained. The new Pennington-Stirling has a twin-cylinder motor, which permits the car to be driven up to a maximum speed of thirty miles per hour. In order to enable persons to examine for themselves the details of the Pennington motor the firm are showing a number of the separate parts of the same, the high-class finish being generally admired.

Quite a new departure, to be seen for the first time at the Agricultural Hall is the Pennington motor-tricycle. This is fitted with a Pennington motor, with electrical ignition and radial discs for cooling purposes. A feature of this machine is the absence of the usual carburettor, the formation of the carburetted air being carried out on the same system as in the Pennington cars. The motor works up to about  $2\frac{1}{2}$  h.p., enabling a speed of 30 miles per hour to be attained. The motor pinion drives the spur wheel on the rear axle direct, but a new departure is the introduction of a friction clutch, so that the motor can be kept running whilst thrown out of gear with the rear axle of the machine. This is, of course, a great advantage when riding in crowded thoroughfares.

A vehicle of quite new design is the Oxford three-wheel two-seated car, shown by Messrs. F. Jackson & Co., of 77 Oxford Street, London, W. The body of the car, which is very attractively finished, is supported on the frame by C springs. The motor is of the vertical single-cylinder petroleum-spirit type, capable of working up to  $2\frac{1}{2}$  h.p.; the ignition is electrical, while radial discs around the cylinder provide for the cooling of the same. The motor is arranged centrally in the front portion of the car, and is provided with a starting handle. The crank shaft works in an oil-containing chamber. Two forward speeds are provided, the two-speed gear adopted being one of the most simple and compact that we have so far seen. The transmission is effected by belts which normally run slack. On the centre of the rear axle is mounted a large pinion, around which is fitted what may be termed a double-purpose gear case, for, in addition to enclosing the pinion, it serves as the support for two small shafts at the top and bottom, these shafts carrying at one end small pinions continually in gear with the large pinion, and at the other end small pulleys for the two belts. A feature of the device is that in changing from the high to the low speed or *vice versa* the handle lever pulls round or pushes back the gear case entirely through a short distance, carrying with it the pinions and belt pulleys. Thus, to put in gear the low speed the lever is pushed over; this has the effect of causing the small pinions to simply roll round the large pinion, one receding and so tightening the corresponding belt, the other coming forward and allowing its relative belt to run slack. Thus both small pinions are continuously in gear with the large pinion, although only one can be driving at a time. With the hand lever in a central position both the belts are slack, the motor being thus cut out from the transmission gear. The whole arrangement is exceedingly simple, and has attracted considerable attention

during the week. Another feature of the gear is that it enables the belts to be taken off for repair, etc., within a few minutes. Indeed, the representative in charge of the stand took off and replaced one of the belts in less than a minute in our presence. The frame of the car is built up of steel tubing, the wheels being of the suspension type with pneumatic tires. A band brake acting on the differential gear on the rear axle is provided, while the steering is controlled by a hand wheel. The car can, it is stated, attain a maximum speed of 15 miles per hour, while with the low gear gradients of 1 in 10 can be mounted. The weight of the car complete is given as 3 cwt., and in view of its low price—£90—there is reason to anticipate that the "Oxford" cars, which we hope to illustrate in a later issue, will soon become very popular. The firm are also building a vehicle of the same type but with four wheels. Another novelty on this stand is a new motor-bicycle which, on first appearance, reminds us of the "Werner." The motor, which is of 1 h.p., is fixed on the "head" of the bicycle and drives the front wheel by means of a cycle chain. The ignition is electrical, and the cooling of the cylinder by radial discs. The motor runs up to a speed of 2,000 revolutions per minute, a speed of 20 miles per hour being, it is stated, attainable without resorting to the use of the pedals. The carburettor in connection with this machine is of a new type, so arranged as to only permit a sufficient quantity of petrol for one explosion to pass at a time. Messrs. Jackson are also exhibiting a motor-tricycle fitted with a De Dion 1½-h.p. motor, and with a front seat attachment, so that the machine can be quickly converted into a quadricycle for two persons.

Although at first glance the vehicles exhibited by the Daimler Motor Co., Ltd., of Coventry and Shaftesbury Avenue, London, W.C., would seem to show but little change from those of a year ago, yet closer inspection brings to light that a good many modifications and improvements have been adopted with the view of increasing the efficiency of this well-known type of motor-vehicle. Of the standard 5½-h.p. type

FIG. 7.—THE DAIMLER CO.'S NEW "CRITCHLEY" TWO-SEATED LIGHT CARRIAGE.

three vehicles are shown, viz., a "Universal" sporting car, convertible to dog-cart, phaeton, or wagonette, a Cranford wagonette, and a "Marseilles" phaeton. The foregoing vehicles are provided with four speeds, ranging from four to sixteen miles per hour, together with a backward motion. Stronger gearing is now being fitted into the vehicles, while larger bearings generally are being employed. The Daimler Company are also now fitting their vehicles with a water-cooling coil, by the use of which the amount of water to be carried for cooling purposes is reduced to four gallons, sufficient, the makers state, for an ordinary day's run, without it being necessary to refill the water tank. The vehicle of this Company which has attracted considerable attention during the week is the new light two-seated carriage illustrated in our issue of the 9th ult., to which we refer our readers for further particulars. The car (Fig. 7) is fitted with a motor capable of working up to 5½ h.p. The car weighs complete only 9 cwt., and is fitted with two speeds, eight and sixteen miles per hour, a hill-climbing gear giving four miles per

hour and a reverse motion. The Daimler Co. is also, we understand, now arranging to build large wagonettes and *chars-a-bancs* to accommodate from sixteen to twenty pas-

FIG. 8.—GENERAL VIEW OF DAIMLER FOUR-CYLINDER MOTOR.

sengers, the vehicles being specially adapted for public motor-car services. For these latter vehicles the company is now building a four-cylinder Daimler motor (Fig. 8), capable

FIG. 9.—GENERAL VIEW OF DAIMLER STANDARD FRAME.

of working up to 11½ h.p., an example of which is to be seen on the stand. Fig. 9 gives a general view of the Daimler standard frame, with motor and transmission gear.

A very large display is made by the Motor Manufacturing Co., Ltd., of 47 Holborn Viaduct, E.C., and Coventry. The exhibit is of a very varied character, comprising no less than five distinct types of vehicles. First we find motor-tricycles fitted with a 1½-h.p. English-built motor of the De Dion type, arranged with either tube or electric ignition, one of the machines shown having a frame adapted for a lady. A two-seated motor-quadricycle is also displayed, while the second type is to be found in a three-seated Bollée voiture adapted to seat two persons in the front, with the driver at the rear. Class No. 3 is to be found in the Panhard-Daimler type of vehicles fitted with a 5½-h.p. motor on a standard frame. Of these several are shown, ranging from a neat four-seated dog-cart to a nine-seated *chars-a-banc* of the kind which is now being employed for public services in various parts of

the country. In this class must also be included a motor parcel van capable of carrying loads up to close upon one ton. Type No. 4 is to be found in the Sandringham phaeton. This is a four-seated vehicle of the type introduced towards the end of last year. It is fitted with a 6-h.p. Iden horizontal motor, four forward speeds and one reverse motion being available. The principal novelty at this stand is, however, the Princess two-seated sociable car. This vehicle was illustrated in our issue of May 26th, but has since been considerably altered in the details. It may be mentioned that the motor is of the two-cylinder horizontal type of  $4\frac{1}{2}$  h.p., with tube ignition and water-jacket. The power is transmitted from the motor-shaft to the counter-shaft by spur wheels and from the latter to the rear road-wheel axle by a central single chain drive, a jockey-pulley arrangement being provided to secure the proper tension of the chain, which is of a larger type than in the first Princess car. Three forward speeds and two reverse motions are provided, while a special feature is the provision of a governing device by means of which when the car is at rest the motor may be kept in motion but slowed down to the extent of but one explosion per minute. The normal speed of the motor is 750 revolutions per minute, but this can be increased to 1,100 revolutions, giving the car a maximum speed of 23 miles per hour. Another feature of the car is to be found in the suspension; not only is the body supported on the frame by helical and C springs but the frame is also supported on the axle through the medium of helical springs. The bearings of the axles are also carried in a box which is free to slide up and down in the support, provision being thus made for the taking up of any strain very much in the same way as is done in locomotives. Another new feature is the provision of a sleeve to, and entirely covering, the rear axle. The vehicle, which weighs complete only  $8\frac{1}{2}$  cwt., is provided with a detachable splash-board, in place of which a small additional front seat can quickly be fitted, while instead of a front seat a rear one can be attached if desired. The new car is very handsomely finished, and altogether is a vehicle which should rapidly attain popularity in the automobile world.

Messrs. Marshall & Co., of Belsize Works, Clayton, Manchester, are present with a couple of their English-built "Hurtu" cars. As we illustrated and described these neat and elegant cars so recently as our issue of June 9th last, it is unnecessary to further refer to them on the present occasion, except to state that they have excited general admiration. Mr. Rush, of the London Autocar Co. is in charge of the exhibit, and has given demonstrations of the running of these cars on the track.

Messrs. Friswell, Limited, of 18 Holborn Viaduct, London, E.C., have a large exhibit of motor-vehicles and motor-cycles. The former comprise cars of the well-known Mors and Benz types, and the latter are of Messrs. De Dion and Bouton's construction. One of the Benz cars on view is fitted with a detachable coupé body, of which Messrs. Friswell are making a speciality. Although the coupé presents a somewhat odd appearance, there is no doubt that for those who use their cars in all weathers it is a convenience. A novelty so far as this country is concerned is the "Elan" two-seated carriage, a French-built car of neat design. As we illustrated this car in our issue of the 23rd ult. it is only necessary to mention that the motor is of the vertical petroleum-spirit type; it comprises two cylinders, with electrical ignition, and is capable of working up to 3 h.p. For cooling purposes, radial discs to the cylinders are relied upon, aided by a small fan driven off the motor, which is located in the front portion of the car. As regards the transmission gear, in line with the motor-shaft, and connected with it by a friction-clutch working inside the fly-wheel, is a variable speed gear shaft, suitably enclosed. Four forward speeds—6, 12, 24, and 35 kilometres per hour—and one backward motion are provided, all controlled by a single lever within convenient reach of the driver. From the variable speed shaft the power is transmitted through bevel wheels to the differential shaft, and from the latter to the rear road wheels

through the usual sprocket wheels and chains. Three brakes are provided—a band brake on the differential shaft and shoe brakes on each of the rear road wheels. The weight of the carriage complete is a little over 6 cwt. Messrs. Friswell, Limited, also exhibit on a separate stand a large range of accessories for motor-car and tricycle users.

The exhibit of the Motor-Carriage Supply Co., Ltd., of Donington House, Norfolk Street, London, W.C., is of a varied character. A German-built Daimler motor-lorry occupies a large amount of space on the stand. It is fitted with a  $7\frac{1}{2}$ -a.h.p. Daimler motor and Daimler transmission gear, and is intended for loads of from  $3\frac{1}{2}$  to 5 tons. Four speeds forward are provided, ranging from 2 to 8 miles per hour. It is intended for a load of from  $1\frac{1}{2}$  to 2 tons. A Cannstatt-Daimler wagonette and a sporting car are the next vehicles which call for mention; these cars are fitted with a  $5\frac{1}{2}$ -h.p. motor, and four speeds ranging up to a maximum of sixteen miles per hour. The cars possess several novel features, the most important of which is the method of fixing the motor, which, together with the speed-gear, is mounted upon a separate tubular frame, so as to greatly minimise the vibration imparted to the main frame and body of the car. Another point worthy of notice is the means employed for reducing the quantity of water required for cooling purposes, which is effected by a new water-cooling apparatus, consisting of a reservoir containing only  $2\frac{1}{2}$  gallons of water, placed in front of the car. The tank is closely packed with small tubes, round which the cooling water circulates. A current of air is drawn through the tubes by means of a fan on the crank shaft of the motor, thus effectually preventing the circulating water from becoming overheated. The arrangement of the speed-gear is also new. The four speeds are divided into pairs, each pair being placed into or out of gear by a separate lever, and is so arranged that while one speed is in gear it is impossible to move the other pair, the lever for that being locked. The foot brake lever, as well as applying the brake, actuates the clutch on the main shaft, thus throwing the friction cone out of gear and applying the brake with one movement only. The bodies of the cars have been built in this country by Messrs. Mulliner, of Northampton. The Motor-Car Supply Co. also exhibit their "motor-wheel"—a three-wheel vehicle, their motor-scout for military purposes, Simms' petroleum-spirit motor of  $1\frac{1}{2}$  h.p. (the feature of which is the large *ailettes* or radial cooling discs), and their well-known magneto-electric ignition device.

The main feature of the exhibits of the Southern Motor-Car Co., of 59 Brixton Road, London, S.W., is the "Georges Richard" light two-seated petroleum-spirit motor-carriage known as the "Duke," an illustration of which was given in our issue of the 23rd ult. The car, which has a neat and attractive appearance, is French built, and is very much on the lines of the well-known Benz carriages so far as the motor and power-transmission mechanism is concerned. The motor is of the single-cylinder type, capable of working up to  $3\frac{1}{2}$  h.p. It is located in the rear portion of the vehicle; its normal speed is 750 revolutions per minute, but it may be varied from between 300 and 1,200 revolutions by means of a button controlling the quantity of carburetted air admitted to the explosion chamber and also by advancing or retarding the electrical ignition. The cylinder is water-jacketed, a series of tubes for cooling the heated water being contained in the rear portion of the body. Three changes of speed—5, 12, and 20 miles per hour—including the new hill-climbing gear of the crypto type, are provided, the transmission being effected by means of belts working on fast and loose pulleys. The road wheels are of the suspension type, fitted with pneumatic tires. The Company are also exhibiting a De Dion  $1\frac{1}{2}$ -h.p. motor-quadracycle for two persons, while in addition they have on view a large range of motor-cycle and motor-car accessories, such as horns, tool bags, dry batteries, mudguards, etc., etc.

The popular little Benz motor-cars are kept well to the front by Messrs. Hewetsons, Ltd., of Dean Street, Oxford Street, London, W., who have eight or nine cars of different

types on view. This type of car is now so well known that it is difficult to say much that is new regarding them. It may be mentioned, however, that the 1899 type of "Ideal" two-seated car is fitted with three forward speeds, including a hill-climbing gear, by means of which it is claimed the vehicle can readily mount gradients of 1 in 4. The various details of the car have also been modified and strengthened as experience has shown to be necessary, the result being a little carriage which is well intended to maintain the already great popularity of this firm. One of the cars shown is provided with a detachable front seat so that it can readily be adapted to accommodate three persons. A Benz dog-cart is also on view. This is capable of seating four passengers, and is fitted with a double-cylinder motor of 5 h.p. Provided with three speeds forward and one astern, this car will, it is claimed, maintain an average speed of eighteen miles per hour, and mount gradients of 1 in 6. Messrs. Hewetsons have also on view a large Benz brake capable of accommodating ten persons. The mechanism of this car is on the same lines as the other Benz vehicles, the counter-shaft being belt driven, with three forward speeds and one backward motion. The motor of this vehicle is a double-cylinder one, capable of working up to 8 h.p.

As usual the Automobile Association, Ltd., of Prince's Road, Holland Park Avenue, London, have a large and interesting exhibit. Dealing first with motor-tricycles, two types are shown—the Autocycle (a German-made machine), and the French-made Barrière. In addition to the ordinary tricycle, a new form of the latter is shown, a motor-sociable-tricycle, arranged to seat two riders side by side. Trailers for motor-tricycles are shown in a great variety of forms. Coming now to petroleum-spirit motor-cars, the first to be noticed is the "Orient Express," which is made in three forms—the Duc, the Victoria, and the Vis-à-vis, the two first-named seating three and the latter four persons. The "Duc," which was illustrated in our issue of April 21st last, to which we refer our readers for further particulars, is fitted with a 4-h.p. motor. The ignition is magneto-electrical, the cylinders are water-cooled, and the transmission is by means of belts with jockey tighteners. The "Orient Express" cars, which are of German construction, are exceedingly elegant in design, and by reason of their relatively low cost should soon become very popular. Several of the well-known Mors four-seated vehicles are shown, as also one of the new Mors two-seated 4-h.p. "Ducs," illustrated and described in our issue of March 10th last. One of the novelties on the stand is the Kühlstein-Vollmer petroleum-spirit motor-cab (Fig. 10), the feature being that the whole of the motor and transmission gear is mounted

FIG. 10.—THE KÜHLSTEIN-VOLLMER MOTOR-TRACTOR.

on the fore carriage. In this case the tractor has been fitted to a carriage of the hansom type, but it may be adapted to any car or van existing, and thus affords an opportunity to owners of great numbers of delivery vans and the like to

have their carriages changed into motor-cars without a great outlay. The motor is a double-cylindered one, and develops up to 6 h.p. The transmission is effected by belts, and the two speeds are applied by jockey pulleys. The ignition is electrical. The front wheels being not only steering but at the same time motive wheels, a great feature of this car becomes the turntable, which is claimed to greatly increase the manœuvring capabilities of the car. The car has been built in Berlin, the system having been used for some time on vehicles employed by the German Post Office for delivering and collecting mails. We are informed by the Automobile Association that when attached to a delivery van this tractor has hauled a load of one ton on ordinary roads at a fair speed with perfect ease.

Other exhibits comprise the "Silent" car, made by Messrs. Gobron & Brillié, of Paris. It is claimed that these are the first cars driven by a petrol motor which are absolutely free from vibration. We gave a brief description of this interesting vehicle in our issue of the 23rd ult., but it comprises so many novel features as regards both the motor and the transmission gear that we propose to refer to it again at greater length in a later issue.

Electrical vehicles are represented by the Elieson "Swan" electric dog-cart. The motor is suspended underneath the car from a tubular frame. A chain is used to transmit the motion of the motor to the driving-wheels of the car. This chain gears with the teeth of a sprocket wheel on the motor spindle, but one of the rivets in every third link of the chain is substituted by a pin, which stands out about an inch on either side of the chain. Round the periphery of the driving pulleys (fixed on each hind wheel of the car) two bands of leather are fastened. These bands are placed the width of the chain apart, and the chain runs these two bands, while the pins grip on the leather. By this arrangement of chain-belt gearing differential gear is dispensed with, so reducing the number of working parts to a minimum. There are five fixed grades of speed, but any desired speed may be obtained. The vehicle—a dog-cart—will seat two persons, with a supplementary seat for a third passenger. The electrical energy is provided by a battery of Crowds accumulators.

In addition to vehicles, the Automobile Association display a large range of motor-car and cycle accessories, including magneto-electric ignition devices, carburettors, batteries, etc. They have also taken up the agency for the Dorey petroleum-spirit motor (Fig. 11). This is being made in three different sizes of 2, 3½, and 5 h.p. The 2-h.p. motor has been specially designed for small cars weighing 3 to 4 cwt. and seating two persons. The bore is 3½ in., the stroke 5½ in., and the number of revolutions 700 per minute. The ignition is by an electric spark, while for cooling purposes the cylinder is provided with radial discs. In respect of the 5-h.p. motor, this comprises two cylinders side by side, the two cranks being set at an angle of 180 degrees. The cooling is effected by water-jackets, and the ignition by electricity or tube as desired. The top of the motor is easily opened for the examination of the working parts.

FIG. 11.—GENERAL VIEW OF DOREY MOTOR.

Messrs. Allard & Co., Ltd., Earlsdon Works, Coventry have on view three motor-tricycles. The motor is of the De Dion type, and is located at the rear as usual. The cylinder has a 3 in. bore by 3½ in. stroke, and is claimed to develop up to 2 h.p. Cooling of the cylinder is effected by radial discs, while the ignition is electrical, or by means of a lamp as desired. A feature of these machines is that the whole of the parts, including the motor, are of the firm's own construction.

A novelty to this country is to be found in the "Victoria Combination" two-seated car exhibited, through Mr. Dick Farman, by the Société Parisienne of Paris. The feature of the car, which has attracted considerable attention during the week, is that the whole of the motor and transmission gear is mounted on the front axle, the front wheels being thus both the drivers and the steerers. The motor is a De Dion single-cylinder one of  $1\frac{1}{2}$  h.p., the ignition electrical, and the cylinder cooling by means of radial discs, the position of the motor being such that cool air is free to circulate around it. A two-speed gear of the Didier type, illustrated in our issue of March 24th last, is provided, by means of which a maximum speed of twenty-two miles per hour can be obtained, or the motor cut out entirely from the transmission gear. The carburettor is of the well-known Longuemare type. Steering is effected by means of a long bar, on which all the control handles are mounted. The car, which is neatly finished, and of attractive design, can, it is claimed, mount gradients of six or seven per cent. The wheels are of the suspension type, with pneumatic tires. Shoe brakes acting on the rear wheels and controlled by a foot pedal are provided. Altogether the car is worthy of notice as showing what can be done in the way of light cars, and as its price is relatively low we may bespeak for it a large degree of popularity in this country as well as in France.

The London Autocar Co., Ltd., 182 Gray's Inn Road, London, W.C., show one or two motor-tricycles of both the De Dion and Beeston Co.'s make, as also a Coventry-built motor-quadracycle for two persons. They also display motor-car and tricycle accessories and an example of the new Accles-Turrell petroleum-spirit motor of  $1\frac{1}{2}$  h.p., one of the features of which are the radiating fins. These consist of thin steel discs, much more numerous and larger than is usually employed. The cylinder barrel and combustion chamber are also formed in one piece, so avoiding a top joint. We may add that this concern are the agents in London for the Hurler cars built by Messrs. Marshall & Co. of Manchester.

Mr. C. T. Crowden, of the Motor Works, Leamington, exhibits two vehicles which have already been illustrated and described in this Journal. The first is a four-wheel dog-cart, propelled by a petroleum-spirit motor, an illustration of which was given in our issue of May 5th last. It is therefore only necessary on the present occasion to briefly mention the details of the car, referring our readers for further particulars to the issue above mentioned. The vehicle has seating accommodation for six persons when carrying a full load, four persons facing the direction of progression and two facing towards the rear. The whole of the controlling and steering apparatus is placed on the right hand of the driver's seat. The motor is of 10 h.p. effective, and is of the twin-cylinder horizontal type. The cylinders are not provided with water-cooling chambers, but the whole of their length is inserted through a large wrought copper tank in such a way that the cylinders are closely in contact with the metal of the tank, and consequently completely surrounded by an envelope of water of considerable depth. The motor is carried at the rear of the vehicle, well off the ground, and above the main frame. The fly-wheel is central with the centre of the car, and rotates in the same direction as the vehicle travels. The engine is so constructed that, at the desire of the driver, either cylinder can be shut out of action, it being claimed that one cylinder furnishes sufficient power to propel the vehicle over fair roads at ordinary speeds. Three forward speeds and one reverse motion are provided, the power from the motor-shaft being transmitted to the counter-shaft by belts which, normally running slack, are tightened by jockey pulleys. From the counter-shaft to the rear road wheels chain gearing transmits the power. Electric ignition is employed, current being supplied to the coil from secondary batteries. The wheels of the car are of peculiar construction. They are of the gun-carriage type, the spokes being double dished. Increased stability is ensured by the fact that in wheels of this type double the width of stock is

obtained. The chain wheels, or sprockets, instead of being bolted to the spokes of the road wheel as is generally the case, are bolted to a flange provided on the wheel hub. By this means it is assured that the hub and chain will always run true with the axle, which is not the case when the sprockets are bolted to the spokes. It is also possible to employ a gear case in this arrangement, whereas this is impossible when the sprockets are bolted to the spokes. The axle boxes are made similarly to the long bolted mail-coach pattern, with a plate at the back of the collar, so that it is impossible for the wheels to come away from the axles unless they are absolutely broken up. The steering mechanism also presents some new features, details of which will be found in our issue of May 5th last. A powerful foot brake acting on the balance wheel shaft is fitted, also a lever brake acting on the two rear wheels; in addition to which the electric current can be turned off and the cylinders made to act as an emergency brake.

Mr. Crowden's other exhibit is the steam brake illustrated in our last issue. The car has been designed and made entirely for experimental purposes, to ascertain what advantages a steam vehicle possesses over a petrol one, and also the h.p. most suitable for the work. The carriage at present is not fitted with change speed gear, but, having a vertical compound engine, it will travel at a very high speed on the level, up inclines and steepish hills. The frame of the car is entirely of steel, with laminated steel springs, and long bolted mail-pattern axles, Crowden's wheels with oak spokes, ash felloes, and rubber tires. The boiler is of the multitubular type, constructed to burn coke or oil, and fitted with improved automatic stoking arrangement. The engine is of the compound type, fitted with link motion and an intercepting valve by which high pressure steam can be used in the low pressure cylinder for starting and for climbing steep hills. The car is fitted with a foot brake acting on a drum on the differential gear shaft, and a screw lever brake acting on both hind wheels, and both of these can be actuated from the driver's seat. The counter-shaft is driven by spur wheels, while chain gearing connects the counter-shaft with the rear road wheels. A number of axles, wheels, etc., made in accordance with his designs, are also displayed by Mr. Crowden, the whole exhibit being of an interesting character.

Messrs. Mulliner, of Northampton and 28 Brook Street, London, W., display a little Benz car, the carriage-builder's portion of which is the product of their works. This firm is making a speciality of, and has earned a high reputation for, this class of work, several specimens of their carriage bodies being visible in other parts of the Exhibition.

The Dunlop Pneumatic Tyre Co., Ltd., of London and Coventry, are present with an exhibit of their well-known wired-on pneumatic tires fitted on Dunlop-Welch rims. These are shown in several sizes, ranging from 2 in. to 3 in., suitable for motor-tricycles, light voitures, and heavy motor-cars.

Messrs. Simms & Co., Amberley House, 12 Norfolk Street, London, W.C., exhibit their special compound pneumatic tire for motor-vehicles, which is claimed to comprise several points of the solid, cushion, and pneumatic tire combined in one new tire. The tire has practically (1) a solid, interchangeable rubber-tread held by two endless electrically-welded steel wires on to the semi-circular (2) pneumatic tire and cover (inner tube), held in place by a special fastening to the side-flanges of the (3) steel rim (semi-circular), forming an air cushion. The rim is built up of three parts, so that the two side-rims may be cheaply and easily replaced without in any way interfering with the spoking of the wheel. The rim is so constructed as to provide surfaces for a rim brake.

The Pendleton Rubber Co., Ltd., of 63 Frederick Street, Edinburgh, exhibit a new solid rubber tire for motor vehicles, known as the "Woodlock." The steel rim is of C section, the rubber tire being held therein by special springs introduced at short intervals. No compression whatever is put on the rubber, and its whole resiliency is, it is claimed, retained, the attachment depending entirely upon the steel

springs. These are fixed in the rim by a simple appliance, and once there it is impossible for them to become detached accidentally. These springs are also claimed to entirely prevent slipping or "creeping" in the rim. The arrangement admits of the rubber being packed on the rim, with the result that any accidental cuts on the surface of the tire close automatically, the makers stating that it is possible to replace even the smallest section of the tire that may have become injured or worn.

Glew's Patent Steel-Shielded Rubber Tyre Syndicate, Ltd., 17 Queen Victoria Street, London, E.C., exhibit their improved cushion tire, which is claimed to combine the ease and comfort of the solid rubber tire without the liability of cutting and wearing out quickly. The felloe of the wheel is of steel, of channel section, and in the groove is a continuous rubber cushion, the rubber being covered and protected by a steel band. This, it is claimed, allows a more virgin material to be used than usual, while the running is smoother and vibration less than in the case of naked rubber tires. The tires can, it is stated, be easily removed and replaced by inexperienced hands in a short space of time. We understand that the tire has been in use on hansom cabs and omnibuses, and has given satisfactory results.

The leading feature of the exhibit of Messrs. J. W. and T. Connolly, of 65 Wharfedale Road, King's Cross Road, London, N., is, of course, the "Ideal" solid rubber tire for motor-cars. These tires are so well known in the motor-car world as to need but little reference at this time. It may be mentioned, however, that the tires are held on the rim by means of two electrically-welded wires in such a way that it is claimed that the tires cannot come off the rims or creep. The tires are now being made in sizes up to 2½ in., suitable for cars of a total load, with passengers, of two tons. We understand that the firm are now arranging to make a 3-in. tire, intended for heavier cars. Samples of the tires are shown fitted to both wood and steel wire-spoked wheels. Messrs. Connolly are also showing the Grant roller-bearing for motor-vehicles, which is being largely used in America. The rollers are conical and are carried on rivets mounted in a cage, each roller being held separately from the other; they work on a conical sleeve fitting over the axle end. This conical sleeve forms one of the special features of the bearing. The sleeve is not pinned or keyed to the spindle, but is free to turn. In the ordinary use of the vehicle, an occasional unusual jolt or jar will cause this cone to turn perhaps half way around, bringing another part of it to the bearing point, and so distributing the necessary wear upon it all over its surface, instead of upon a single point as is the case when the cone is keyed to the spindle. Thus it is possible to easily take up the wear, or end play, on the bearing. Another exhibit at this stand is Potter's roller brake for rubber tires. In this, the brake shoe, instead of bearing direct on the tires, carries two steel rollers, free to rotate, the action of the brake thus being not so violent, so preventing damage to the tire.

The Anglo-American Oil Co., Ltd., of 22 Billiter Street, London, E.C., it is almost needless to remark, are present with an exhibit of their well-known petrol for petroleum-spirit motors, together with a number of petrol storage tanks, barrels, etc. The Company has lately made a new departure in putting up their spirit in small-sized and air-tight cans, which greatly simplifies the question of storage, and also enables owners of motor-cars to conveniently carry a supply of spirit whilst on tour.

The Mossberg Roller Bearings, Ltd., of 6 Victoria Street, Westminster, and Birmingham, have an interesting display of their bearings, for which many claims are made in the way of reducing friction, etc. The rollers are made of hardened and ground tool-steel, and, while held in a bronze cage, are free to rotate on a tool-steel shell, generally fitted round the shaft or axle. A number of applications of the roller bearings are shown, including one to a brougham axle and wheels.

Messrs. Brampton Bros., Ltd., of Oliver Street Works, Birmingham, make a small display of their now largely-used

motor-car driving chains and chain wheels. The chains are made in both solid block and roller pattern, in pitches from 1 in. up to 3½ in. pitch. The products of this firm in the way of driving chains and chain wheels are too well known in the automobile world to require any lengthy description at this time. They are also exhibiting their "Multispiral" saddle, specially arranged for use on motor-tricycles. The claims made for this saddle are that there is no hard peak, no hard back plate, and that while lighter than usual it gives a comfortable seat.

Messrs. C. W. Burton, Griffiths & Co., of Ludgate Square, Ludgate Hill, London, E.C., are the only firm showing machine tools, their exhibit comprising a very large range of tools and machinery used in the manufacture of motors and motor-cars, such as Garvin milling machines, Cincinnati screw-cutting lathes, etc.

Messrs. Crossley Brothers, Ltd., of Openshaw, Manchester, show in motion one of their 8-h.p. high-speed gas engines capable of working up to 24½ effective h.p. The engine is fitted with an extra heavy fly-wheel, and is claimed to be specially suitable for electric lighting work. The firm also display a couple of their oil engines—one of 7 h.p., working up to 11 effective h.p., and a small one of the same type, working up to 3 h.p. The consumption of oil in these motors is stated to be only .8 pint per b.h.p. per hour.

Messrs. Salsbury & Sons, Long Acre, London, W.C. in addition to showing their acetylene candles, make a large display of the well-known and largely-used Dietz tubular petroleum lamps and head-lights for motor-vehicles. The lamps are of 25 candle-power throwing a light a considerable distance ahead of the car.

Late on Wednesday evening a neat little car was placed on exhibition by Higg's "Champion" Car Syndicate, of 17 Ironmonger Lane, London, E.C. The vehicle takes the form of a small four-seated dog-cart. It is propelled by means of a 1½-h.p. De Dion motor. There are several novel features about the car, especially in the steering and starting gear, to which we intend to refer at greater length in our next issue. Pressure on our space also prevents us from dealing this week with quite a number of the exhibits, but these will be dealt with in due course next week.

---

Boston, U.S.A., intends transporting its street-cleaning machinery with automobiles in place of horses.

LA SOCIÉTÉ DES SPORTS DE SAINT ETIENNE is organizing a series of three races for Sunday next, the 9th inst.—one for motor-tricycles, one for motor-tricycles with trailers, and one for motor-voitures.

A COMPANY has just been formed at Jersey City, N.J., U.S.A., with the title "Riker Electric Vehicle Co.," with a capital of £1,400,000. The incorporators are Andrew L. Riker, William G. Meyer, and James C. Young.

WE learn from a Mexican correspondent that an application has been made for permission to run a service of motor-omnibuses in the city of Mexico. No information is so far available as to the type of vehicle to be adopted.

THE municipal authorities of Boston, U.S.A., are wrestling with an ordinance to compel the licensing of all motor-vehicles. The ordinance introduced reads as follows: "Nor shall any owner or driver of any vehicle drive it or permit it to be driven on the streets of Boston by power of steam, gas, gasoline, naphtha, compressed air, electricity or combination of any or all without a permit from the Board of Aldermen." There is no shadow, states the *Horseless Age* of New York, of justification for the licensing of motor-vehicles, unless all vehicles are to be licensed. The motor-vehicle is not a road destroyer like the horse, but a road maker; it is safer and more manageable than a horse; it will relieve the congestion of the streets and facilitate travel and traffic in general. How, then, can it rightly be subject to restrictions from which horse vehicles are exempt?

## THE GAILLARDET MOTOR-TRICYCLE.

WE are now able to give in Fig. 1 an illustration of the Gaillardet petroleum spirit motor as fitted to a motor-tricycle, about which so much has recently been heard. The motor, which is made by La Société

FIG. 1.—THE GAILLARDET PETROLEUM MOTOR.

Française d'Automobiles, Quai National, Puteaux, France, is claimed to be capable of working up to  $2\frac{3}{4}$  i.h.p. at

FIG. 2.—THE GAILLARDET IGNITION APPARATUS.

from 1,200 to 1,800 revolutions per minute. A striking feature of the motor are the cooling discs, which are not only

larger than usual but extend to the top of the explosion chamber. The inlet and exhaust valves are so arranged that by removing a couple of bolts they can be instantly taken out for cleaning purposes, etc. The working parts, including the exhaust-valve operating gear, are all contained in an aluminium case. The ignition is electrical, an illustration of the Tremblet arrangement being given in Fig. 2. The carburettor consists of a brass tank capable of holding about 3 litres of petrol; it is filled by means of a pipe at the side, so placed as to indicate the maximum level. An air inlet at the top is so devised that its inner orifice can be adjusted to within a few centimetres of the level of the spirit, being lowered and raised as required. Another valve at the top regulates both the admission of carburetted vapour and the air, in one of its extreme positions shutting off the vapour entirely and admitting only air, and in the other extreme position shutting off the air entirely and admitting only vapour. A further valve regulates the supply of explosive mixture to the explosion chamber of the indicator. The mixture is given a slight preliminary heating by means of the exhaust gases, a part of which are conveyed by a pipe through the bottom of the carburettor.

THE Leith Cycling Club has had a successful moonlight run, a motor-car with a party of six leading the way.

REFERRING to the Motor-Car Exhibition, the *Daily Chronicle* mentions the facilities for hiring vehicles for drives as a popular and special feature.

THE gentleman on the *Financial News*, in alluding to the Exhibition now in progress, heads his article "More Motor Madness," with the usual smell, coughing, and spluttering.

THE NATIONAL WHEEL AND TRACTION Co. is the name of a company which has just been formed in New York to manufacture motor-vehicles, etc. The capital is 16,000 dols.

ALTHOUGH the motor-car has not appeared in any of the recent bye-elections it has lately been seen at an election at Leamington, the occasion being a school board election contest.

THERE are about a dozen Pennington cars on view at the Exhibition, and much interest has been centred in their movements, but considerable disappointment has been expressed at the absence of the Star Motor Co.'s vehicles from the display.

MR. AND MRS. JOHN DAVIS have started from the office of the *New York Herald* to go to San Francisco on a motor-car. In the course of the 3,700-miles run they will call at the offices of many leading newspapers, and report upon the roads in a way that they hope will be serviceable to future motorists "going that way."

THE City Motor-Car and Carriage Syndicate, Limited, is the name of a company which has been registered, with a capital of £10,000, to carry on the business of motor-car, carriage, and cycle manufacturers, steam, oil, gas, and electrical engineers, etc. The registered office is at 31 Westgate Road, Newcastle-on-Tyne.

FROM a pamphlet explanatory of the patent agency of Messrs. Phillips, Ormonde & Co., 533 Collins Street, Melbourne, we learn that to "our Mr. Phillips belongs the proud privilege of being the first patent agent in Australia to make use of a motor-car"—which indicates that the spirit of enterprise is with his firm.

ON Saturday a motor-cycle race meeting was held at the Crystal Palace under the rules of the Motor-Car Club. Mr. S. F. Edge won all events. He did the one mile handicap in 1 m. 50 s., the five mile race in 8 m. 55½ s., the two mile handicap in 3 m. 28½ s., and won the Crystal Palace Brassard 100-guinea cup by motoring 34 miles 540 yards in the hour. His final success was with Mr. C. Jarrott, when they did a mile on a motor-tandem bicycle in 1 m. 43½ s.

## MOTOR-CARS ON THE CONTINENT.

### A Russian Motor-Tricycle Race.

THE annual cycle race between Moscow and St. Petersburg is this year being extended to include motor-cycles. The journey was to be made in two stages, commencing midnight, July 2nd, the first stage being from Moscow to Volotchok, the second from the latter town to Tsarkoie-Selo (St. Petersburg). The result of the race has not yet reached us.

### Motor Road Services in Spain.

WE learn from a Spanish correspondent that a service of motor-vehicles has just been started between Rosas and Figueras, a distance of about 18 kilometres. The vehicles employed are of 8 h.p. and have seating accommodation for nine passengers.

### A Paris-St. Malo Race.

THE Association Velocipedique d'Amateurs, of Paris, is organizing a race between that city and St. Malo for the 30th inst. The distance is 365 kilometres, the race being divided into the following three categories: (1) vehicles with motors of 5 h.p. and over, (2) vehicles with motors of less than 5 h.p., (3) pedal-aided motor-tricycles.

### The Paris-Brest Motor-Tricycle Record

THE recent record for motor-tricycles between Paris, Brest and back established the other week by the old racing cyclist Terront has just been broken by Corre, who covered the 1,200 kilometres in 33 h. 3 m. 46 s. as against Terront's 40 h. 26 m. 4 s.

### A Projected Automobile Fete at Pau.

A PROPOSAL to hold an automobile fête extending over a week in February next is under discussion at Pau. In connection with the fête there will probably be a race from Pau to Bayonne.

### A New German Motor-Car Company.

ONE of the latest concerns in Germany to enter the motor-car industry is the Motorfahrzeug Gesellschaft, 44a Kaiser-Wilhelmstrasse, Dusseldorf. From the particulars sent us this company appears to be not only constructing motor-bicycles of the Werner type and motor-tricycles on the De Dion system, but is also making a light two or three-seated petroleum-spirit motor-carriage very much on the lines of that known in France and in this country as the Decauville. The motor is a 2-cylinder one of 3 h.p. located in the rear portion of the car; radial discs to the cylinders provide for the cooling of the same, while the ignition is electrical. Two speeds are provided, the power being transmitted to the motor shaft to the intermediary shaft through spur gear wheels and from the intermediary to the rear road-wheel axle through bevel wheels. The frame is built of steel tubing: the road wheels are all 23 in. in diameter; they are of the suspension type with pneumatic tires. Fitted with a hood, the little car has a very neat and elegant appearance.

### Postal Motor-Vans in Austria.

THE Austrian Ministry of Commerce is reported to be contemplating the introduction of motor-cars for the conveyance of mail bags to and from the railway stations, as well as for the delivery of the parcel post and the collection of letters from the pillar-boxes.

### The Belgian Automobile Races at Spa.

AT the Belgian Automobile Club race of 120 miles on Tuesday over a very hilly course, through the Ardennes, beginning and ending at Spa, M.M. Charron and De Knyff used for the first time new 16-h.p. Panhard cars specially adapted for a hilly course, the lowest speed being 10 and the highest 40 miles per hour. It was raining hard at the start. M. De Knyff won in 4 h. 37 m. M. Charron could not use his third speed for the latter portion of his time, which was 5 h. 31 m. M. Pinson, on an 8-h.p. Panhard, was third, his time being 5 h. 51 m. Other carriages used were an Amedée Bollée, a Bolyde, and a Belgian-built Daimler.

## CORRESPONDENCE.

### THE PENNINGTON TWO-CYLINDERED MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the recent controversy which I had in your paper with Messrs. Pennington & Baines, or perhaps I should rather say Mr. E. J. Pennington, business recently called me to Manchester, and whilst there I had an opportunity of not only trying the latest Pennington two-cylinder car, but also their cheap single-cylinder, and I must say that they seem to be very practical vehicles, and the two-cylinder one does work in the way of speed and hill-climbing that is only equalled by the very expensive cars made in France. The simplicity in regard to the manufacture and running of them is something marvellous.

This did not impress me, however, to such an extent as when I was down at some cycle works where some of these were being manufactured. They were being turned out by a cycle manufacturer, and, he told me, with his ordinary cycle tools.

I myself saw a good number of these cars coming through the works and several just ready for despatch, so that there is no doubt Pennington cars are not merely being advertised, as I rather inferred in my previous communications, but are now being manufactured and sold commercially.

I was myself so impressed that I placed an order for a two-cylinder car, and am quite prepared to wait my turn for this being delivered, as I can see that it is something worth waiting for; and now that they are coming through good responsible works regularly, it is only a matter of undoubtedly a few weeks for a very large number of them to be launched all over the country.

It seems to me that the keystone to the good running and simplicity of these cars is that they are built on cycle lines, with ball bearings, and steel, and steel tubing, etc., in the place of heavy carriage or engineering work, where ordinary solid steel or cast iron is employed.

I thought it only common fairness to let you know this after my recent letters on the subject of Messrs. Pennington and Baines' car, and I have no doubt the progress that is being made will be of interest to many of your readers.

London, W.C.,

July 3rd, 1899.

Yours truly,

S. F. EDGE.

MOTOR RACES AT NEW BRIGHTON.—The executive of the New Brighton Tower Grounds are turning their attention to motor-cycles, for to-morrow a grand international motor cycling tournament is to be held. The entries include the names of the celebrated French motorists, Béconnais (the winner of the "Criterium de Motor-Cycles," and Deemster, who, since motor-cycle races have been held, has won nearly a score of first prizes. The English entries include the names of Messrs. S. F. Edge and C. Jarrott. The programme of events will be:—1, Promenade of competitors; 2, one mile open; 3, ten miles record by Pennington torpedo car; 4, five miles open; 5, attempt on five miles tricycle record.

## HOW TO KEEP COOL—BY MOTOR-CAR.

WHILE, during the recent spell of hot weather, a perspiring world was wondering how to keep cool, the solution came to a representative of the *Pall Mall Gazette*, who thus describes the process: It is simplicity itself. All you have to do is to get a motor-car and go careering about the country. The gentle gliding through the air produces an ineffable content, and one is fanned into a state of delightful coolness. The discovery, like all great ones, came about in a simple manner. I had chance to remark that I had never been on a motor-car. "Then come for a ride on mine," said a friend, and I, without knowing all that depended on my answer, boldly said yes.

I almost repented when I saw the machine, panting and puffing, quivering almost with the excitement of a greyhound in the leash, anxious to be off. But, fortunately for a long-suffering mankind, I mounted beside my host and we started. It follows as a matter of course that when you want to show off the good points of anything, a horse, a dog, or a piece of machinery, something is bound to go wrong. And so it was in this case. Only "a little stomach-ache," however, as the owner humorously put it. A turn or two of a screw soon made this right and we began to thread the maze of London traffic on the way to the country. The car, like the majority of those at present in use, was driven by petrol, the motive power being obtained from the ignition of the mixture formed by the gas from the oil on coming in contact with the air. I am bound to say that it smells unpleasantly at first, but when any rate of speed is obtained this all disappears, and nothing but agreeable sensations are felt. That is, if you are on a good road, and of these, I'm sorry to say, we soon had striking proof there are very few in London. Some of the pavements, in fact, gave a kind of combined hunting and driving exercise.

The one thing in particular that struck me as we twisted in and out among cabs, omnibuses, and the thousand-and-one vehicles one sees in the streets was the marvellous control that the driver had of his machine. With his hand on the steering-bar—very much like the helm of a small yacht—and his feet on two piano-like pedals, it was marvellous how he manipulated the car's career.

"In what distance can you pull up?" I asked. "In the car's own length," was the reply, and the sudden halting of a brougham in front provided me with an excellent sample of the truth of the statement. As we went along my host began to show me how fast the car could go.

"Is there a policeman in sight?" he said, as we approached the open country. "No," I replied, and the next minute we were flying along at the speed of an express train—much faster than you travel in those open-air carriages that they have on the railway between Dublin and Bray.

"Ware hawk!" I cried, and as we passed the man in blue he looked astonished to see that what he would have sworn was going twenty-five miles an hour was really not going much more than six. Out of his sight off we were again, the rush of air producing a most exhilarating effect; cyclists, traps, we simply walked past, and I grew enthusiastic. My host expects that electricity will be the motive power when ordinary locomotion is conducted in this way. That has no smell; there is none of the miniature earthquake business prior to a start. The machine, which it is safe to say is the forerunner of the car of the future, is the invention of an English firm, Messrs. Leitner—although the name sounds rather German.

I was invited by one of the partners to try it, and although it may seem ungrateful, the difference between it and the oil-driven car was really wonderful. The ease with which it could, without any fuss, back, turn, and stop—thanks to a marvellous electrical brake—and the speed at which it could travel were simply a revelation. The motive power is stored, and the small quantity that can be carried is at present the only drawback of the electric car. But when their use is more universal and storage stations are fixed up and down the country the difficulty will disappear. I went out a sceptic and returned a convert. I easily foresee the time when all our travelling will be done by motor-car; there will be no more stuffy railway carriages, and, above all, we shall be able to keep cool.

## MOTOR-CAR SERVICES AT NEWCASTLE.

THE motor-car has invaded Newcastle, and last week, while the races and the temperance festival were in full swing, a car ran between the Grey Monument and the Town Moor, making three or four journeys each way within the hour, and being filled each time. This vehicle is of the wagonette type, holding eight passengers, who were carried at a twopenny fare, and, for speed and comfort, is far and away ahead of any other vehicle at present in the streets of Tyneside. After the extraordinary traffic northwards ceased with the races and the festival, the car—which is the property of the Tyne Motor-Car Company—has been carrying passengers between the Monument and the end of Jesmond Road, and upon that route has been entirely successful. During the busier parts of the day it has always as many passengers as it will accommodate, and it has always a "paying cargo"—to apply a nautical expression. With the modern motor there is no more danger, either to pedestrians or to passengers, than there is with a cab or a tram-car. It is under thorough control as to steering, and its powerful brake enables the driver to stop it in a moment. Given smooth roads, such as they are not in Newcastle, there is nothing in existence that could beat the motor-car in speed or comfort. The motor-car now running in Newcastle is the first that has plied there for traffic, but the service of motor-cars will be extended immediately. The success of a similar venture

in Sunderland suggested the introduction of this car by the Tyne Motor-Car Company at Newcastle. The other local company, to whose energy was due the series of trials that were held in Newcastle some weeks ago, has been registered, and has several cars already in Newcastle. These will shortly be put upon the streets. It is called the City Motor-Car and Carriage Syndicate, Limited, with a capital of £10,000. The signatories to the memorandum and articles of association are County Alderman John Dent, J.P., Mr. F. S. Strickland, Mr. W. S. Vaughan, Mr. Frederico George Lundy, Councillor Whitley, Councillor William Spicer, J.P., Councillor J. J. Forster, and Councillor Ralph Carr, all being, with the exception of Councillor Whitley, residents of Newcastle. Mr. Ralph Carr is the general superintendent. Mr. Rowland Barnett, who is the pioneer of the motor-car industry in Newcastle, has been appointed consulting engineer to the syndicate, of which Mr. F. G. Lundy is solicitor and secretary. This Company will put five cars upon the streets immediately, covering first the Jesmond route. Subsequently, all the tramway routes as proposed in the Corporation's Bill will be covered. Even this does not exhaust the interest in motor-cars at Newcastle, for rumours as to the formation of yet another company are afloat.

## MOTOR-CAR VERSUS HORSE.

On Friday last, at Westerham, Mr. C. W. Brown and Mr. F. F. Maclean were summoned for driving a light locomotive over twelve miles an hour at Riverhead, on May 27th. Mr. A. Y. Hyland appeared for the complainant, Mr. Walter Brydan, and explained that defendants were driving the locomotive regardless of the bye-laws laid down by the Local Government Board, and were liable to conviction under article four of those bye-laws. Mr. O. Holmes Beatty defended. Mr. Brydan stated that he was riding horseback with Mr. Alexander. Defendants came along in a motor-car. He put up his hand for them to stop, but they took no notice. His horse was frightened and bolted. He afterwards followed defendants, who refused to stop, or to give their names when ultimately brought to a standstill. They called him a blackguard, and threatened to run into him. They were travelling from fifteen to sixteen miles an hour. By Mr. Beatty: He held up his hand for defendants to stop. The alarm was not sounded until then. He did not know who was driving the car. The Chairman said he did not think prosecutor could be expected to know who was driving while he was engaged with a restive horse. Mr. Alexander, of Kemsing, gave corroborative evidence, and said when he called upon defendants to stop they refused, and looked back and laughed at him. "Do you know much about a motor-car?" asked Mr. Beatty.—"No, thank goodness, I don't," witness replied. "Who was driving?"—"I don't know how you drive the thing. It may have taken two to go at the pace it did." Miss Dunster, a lady from Knockholt, said she was driving from Westerham towards Sevenoaks. When she turned on to the main road she saw a man on horseback holding up his hand. His horse was very frightened at the motor, which was going at a tremendous pace. All defendants said to the rider was "You ought to be able to manage your horse better." Mr. Beatty contended that only the driver could be summoned. It was admitted that Mr. Brown was the driver, therefore he asked that the case against Mr. Maclean should be dismissed. The former, a journalist well known in the cycling world and an authority on motor-cars, was experimenting with the machine at the time. The low gear was on, and it was impossible to travel with it at a greater pace than nine miles an hour. Motor-cars, he said, were going through the times experienced by cyclists in the early stages. It was unreasonable to pull up for everyone that called to them. Mr. Brown then gave evidence. He denied that he heard complainant call to him until after the car had passed. Complainant said something as they passed, but he could not hear what was said. By Mr. Hyland: The maximum speed at high gear was from sixteen to eighteen miles. Mr. Maclean, of Putney, said he did not know much about horses, but certainly the horses did not appear frightened at the car. One horse was dancing in front of the car and another at the side, whilst going up the hill. Mr. Maclean was acquitted. Mr. Brown was fined £5, and 10s. costs.

## "ALL A POLICE MISTAKE."

THE action of the House of Commons police in refusing, on Monday night, to admit the automobile belonging to the Hon. John Scott Montagu, M.P., to Palace Yard was, it turns out, one of the very rare errors on the part of the custodians of Parliament.

On Tuesday evening, the Hon. J. S. Scott Montagu, M.P., accompanied by Capt. H. R. Langrishe, was allowed without let or hindrance to drive his automobile past the police on duty.

To a representative of the *Daily Mail* Mr. Montagu said: "The sergeant at the gate told me he had received no orders to prevent my entry, and so I drove in. After the occurrence of Monday I saw the Sergeant-at-Arms, who told me he had given no instructions with respect to petrol-driven cars as distinguished from electrical vehicles.

"Inspector Horsley told me that as far as he knew a rule had been made to exclude tradesmen's carts driven by any other means than that of electricity, as on one occasion, some years ago, one had caused some annoyance. I naturally claimed the privilege as a Member to go to the House exactly as I pleased, and was prepared to carry the matter further, but it was intimated that no further opposition would be offered, and so I just ran in on Tuesday on my way from the Motor-Car Exhibition at the Agricultural Hall to prove this.

"My car is an 11-h.p. English Daimler, and to talk of its being dangerous is ridiculous. It might just as well be said that hansom cabs should be kept out of the yard, for a horse might quite easily run away and cause damage to the railings.

"I'm very pleased that the matter has been settled, as in a few years a very large proportion of the vehicles visiting the House are certain to be automobiles, and therefore it is better to have a distinct understanding to commence with.

"The whole thing is admitted to have been a mistake by the police," was the explanation given at Her Majesty's Office of Works to a *Daily Mail* representative. "In March last an order was issued prohibiting tradesmen's oil motor-vans from entering the yards at the Houses of Parliament, owing to a tradesman's oil motor having flared up in the yard, but the regulation was not intended to apply to M.P.'s or other private automobiles. The police made a mistake in prohibiting Mr. Montagu from entering in his automobile, but the matter has now been explained, and there is no need to make any alteration of the regulations as to horseless vehicles."

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**FOR SALE.**—Mytholm Motor-Car, double cylinder, 3-h.p. petrol motor, three speeds, ball bearings, rubber tires, £110. Photo, three stamps. Also 8-h.p. two-cylinder Mytholm Petrol Motor, complete with tube ignition and carburettor, £55. 3-h.p. two-cylinder Mytholm Petrol Motor, £32.—Brown & Buckton, Hipperholme, Halifax.

**WANTED to Hire,** by a Dental Practitioner in Ireland, a small Motor-Car or Tricycle, suitable for two persons. De Dion preferred.—Apply Box 101, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**MOTOR-CARRIAGES,** deliverable directly, system Panhard, Benz, Peugeot, Mors, Decauville, Cambier, Rochet, Silmeider; tricycles.—Apply to Géo. de la Nézière, 51 rue Vivienne, Paris.

**FOR SALE.**—Beeston Motor-Tricycle, almost new; owner going in for Motor-Car. Will accept £55.—Nesham, 25 Bright Street, Middlesbrough.

**FOR SALE.**—Benz 5-h.p. Dog-Cart, nearly new; written guarantee given as to condition; many improvements added.—Price and full particulars to Box 72, *The Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**BOLLÉE,** in good order, £60; Motor-Tricycle, tube ignition, £50. Both fast machines.—Owner, 83 Cautsfield Street, Liverpool.

**REV. ARUNDELL WHATTON** offers splendid Daimler Marseilles Phaeton, in thorough going order and excellent condition. Luncheon basket, clock, extra screw brake. £290.—16 Montpellier Square, Knightsbridge.

**1899 BEESTON QUADRICYCLE,** for two riders, Dunlop tires, almost new, having been ridden only about 100 miles; good reason for selling; bargain.—Prince, 198 Stretford Road, Manchester.

**FOR SALE AS BARGAINS.**—Two Bollées and three De Dion Tricycles, all new, fast machines. Inspection invited. Platinum Tubes and Accessories always in stock.—Motor Agency Co., Ryley Street, Coventry.

**WANTED TO HIRE.**—Motor-Car. As it is to be used for advertising purposes, a noisy one would suit. Quote terms by the day or week to M. D., c/o Mr. Carter, 161 Strand, W.C.

**FOR SALE.**—International 3-h.p. Benz Dog-cart, spare tank and accumulators, in splendid condition, £130.—M., 48 Thomas Street Limehouse, London, E.

**MOTOR-TRICYCLE.**—Beeston 1½ h.p., tube ignition; almost new, fine running order, £33.—Homan, Claygate, Surrey.

**DECAUVILLE CAR,** nearly new, pneumatic tires, very handsome. To be seen and tried.—Simkiss & Knighton, Engineers, California Works, Derby.

**INTERNATIONAL 3-h.p. CAR,** splendid condition, very little used. Owner going abroad. Real bargain. For full particulars address Box 123, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

**FRENCH ENGINEER,** motors and motor-vehicles, desires Partner active or sleeping, to establish works in France and England to construct new type of motor and motor-vehicles; or would collaborate with an existing firm.—Address G. Gautier, 14 Rue du Pont, Suresnes, Paris.

**TO Motor-Omnibus Touring and Hiring Companies.**—Experienced MANAGER (Secretary) Disengaged.—Box 131, *The Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

**PLATINUM.**—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices by Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797.

**LARGE STOCK** of Motor-Car Tricycle Frames, with all latest improvements; two band brakes, cased-in pattern axle, free chain, hubs and pedals, and all connections ready to attach to motor; electric connection in handle-bar; highly enamelled and plated.—Brown Brothers, Ltd., Great Eastern Street, London, E.C.

**MOTORS ON HIRE.**—Daimlers, Panhards, Benz, New Beestons, etc., in good order, by day, week, or month.—The Yorkshire Motor-Car Co., Ltd., Bradford.

**ELECTRICAL EQUIPMENT FOR MOTORS.**—Improved Dry Cells, Accumulators, Special Transformer Coils, Ignition Plugs, Flexible Wire Connections, etc. General Accessories, wholesale and retail.—J. Burns, 44 Berners Street, London, W.

**AGENCY.**—Royal Lancashire Agricultural Show, Liverpool, August 3rd.—Wanted, Charge of Exhibits; fully experienced; can drive, and would act as agents.—The Syren Motor Co., 101 Smithdown Road, Liverpool.

**WORKING DRAWINGS AND TRACINGS EXECUTED.**—Apply, stating terms and wants, to D. 691, *Motor-Car Journal*, 39-40 Shoe Lane, London, E.C.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS

### The Exhibition— a Great Success.

At 10 p.m. to-morrow (Saturday) the doors of the Agricultural Hall will close upon the Motor-Car Exhibition, which for the last fortnight has demonstrated the possibilities of motor-vehicles and evidenced the public interest in improved locomotion. As to the success of the event there has been no doubt. Visitors have come from Scotland and Ireland, as well as the busy centres of Lancashire and Tyneside, Yorkshire, and the Midlands; while prospective promoters of motor-car services in holiday resorts have recognised the value of bringing such a collection of vehicles under one roof. From the exhibitor's point of view everything seems to have given satisfaction, and business has been good. Not only have the public been present, but the endeavours made to secure the attendance of that section interested in automobilism have so far succeeded that exhibitors generally have had a busy time, not only in answering inquiries, but in booking orders and cultivating acquaintances that will be useful in the future. Flattering have been the remarks addressed to the promoters of the Exhibition, and the following letter from Mr. H. Hewetson is selected as typical of the opinions freely expressed:—"Your Exhibition has been a great success. We did fairly well at Richmond, but at the Agricultural Hall we have done far more than we anticipated. One car we could have sold twelve times over, and we must at least have booked and sold for forward delivery forty to fifty Ideal motors, besides a few 8-h.p. dog-carts, and you have completely cleared us of all our stock."

### Juvenile Automobilists.

A NOVEL sight was witnessed at the Exhibition at the Agricultural Hall on Wednesday afternoon, when the Berkeley electric bath chair was driven round the arena for a considerable time by two little children, the eldest of whom was only eight years of age. A better testimony as to the simplicity of the Berkeley vehicle and the ease with which it can be controlled could not be imagined.

### An "Albone" Motor-Car.

IN the course of a chat with Mr. Dan Albone, of Biggleswade, at the Agricultural Hall this week we learned that he is at present engaged on the construction of a new four-seated car in accordance with his own designs. The motor is a 3-h.p. one, of the Benz horizontal type, so arranged that it can be started from the seat. The transmission will be by belts and steel chains, a two-speed gear being provided. The motor and transmission gear will all be mounted on a distinct tubular type, to which any kind of carriage body may be fitted. The wheels are to be of the suspension type, fitted with Albone ball bearings. We are promised further particulars of the car as soon as it is finished.

### A 2½-h.p. De Dion Motor and Motor-Tricycle.

WE learn that the United Motor Industries, of 3 Rue Meyerbeer, Paris, which is managed by Mr. H. O. Duncan, are in a position to supply to England the latest 1899-1900 standard pattern 2½-h.p. genuine De Dion-Bouton motor, either separately or fitted to tricycles and quadricycles. This new motor has been kept a secret, but it has been going through some severe tests before being adopted by Messrs. De Dion-Bouton & Co. as their new standard model. This 2½-h.p. motor is, we understand, the identical type that was placed first, second, and third in the recent Paris-Bordeaux contest, and ridden in England by Mr. S. F. Edge and Mr. Charles Jarrott with great success. We anticipate a large demand for tricycles and quadricycles fitted with this motor, as more power is required for England, where roads are more hilly than in other countries.

### A Whitney Steam-Carriage at the Exhibition.

CONSIDERABLE interest was evinced at the Exhibition at the Agricultural Hall on Tuesday afternoon by the arrival of Mr. Whitney, of the Whitney Steam Wagon Co., of Boston, U.S.A., on one of his steam carriages. As a lengthy illustrated description of this type of vehicle was given in our issues of June 2nd and 9th last, it is only now necessary to briefly refer to the details. The car, which is the first one to be brought to this country, has an extremely neat appearance, and, while weighing only 615 lb. complete, can accommodate four passengers. The boiler and engines are arranged under the body of the car on a tubular frame, the engines, which comprise two 3½-in. by 6-in. cylinders, driving the rear axle direct. A feature of the car is that the whole of the control—forward and rearward motions, steering, etc.—are controlled by one lever. The road wheels are of the suspension type with pneumatic tires. As we have said, the car attracted considerable attention, not only from the point of view of its novelty, but from the way it answered to the control of Mr. Whitney in the run round the demonstrating arena.

### The Makers of the Pennington Cars.

IN the course of a chat with Mr. Pennington this week, we learn that he has arranged with quite a number of well-known firms to manufacture his cars. Among the firms are the following: Stirling's Motor Carriages, Hamilton, N.B.; Palmer's Shipbuilding Co., Jarrow; The Eclipse Machine Works, Oldham; Wm. Sellers & Sons, Keighley; the Protector Lamp & Lighting Co., Eccles, near Manchester; T. Coulthard & Co., Preston; Messrs. Gilbert & Son, Limited, Lincoln; Frank Morris, Motor Works, King's Lynn; Messrs. F. Savage & Co., Ltd., King's Lynn; Pearson & Bennion, Leicester; and T. C. Courteen, Cheltenham. It will be seen by the above names that the construction of the Pennington cars is in good hands, and with so many concerns engaged on their manufacture they should soon be seen in large numbers on the roads throughout the country.

### The Duke of Westminster an Automobilist.

WE learn that after an interview of Mr. Frederick R. Simms with the Duke of Westminster, who paid a visit to the Exhibition at the Agricultural Hall, his Grace has placed an order with the Motor-Carriage Supply Co., Ltd., for one of their new 4-h.p. Cannstatt-Daimler motor-cars, fitted with magneto-electric ignition, the carriage part of which will be specially built by Mr. Arthur Mulliner, of Northampton.

### Baron de Zuylen and the Automobile Club.

WE are informed that M. le Baron de Zuylen de Nyevelt, the President of the Automobile Club of France, has accepted the invitation of the Automobile Club of Great Britain and Ireland to a dinner to be given in his honour by the Club at the "Star and Garter" Hotel, Richmond, on the 24th inst.

### The Coming Boom.

"THAT the motor-car movement is making very rapid progress in this country is apparent to everybody with their eyes open. Yet" says a correspondent, "I venture to say that only a comparatively few people who have been fortunate enough to get a glimpse of what is now going on behind the scenes, so to speak, have the slightest conception of the present extent of the movement or the magnitude of the business being placed for the coming year. From France I have this week been furnished with figures relating to the position of the motor industry in that country, and I can only say that their magnitude is astounding; and although the volume of business passing through the hands of the makers in Great Britain is small in comparison, yet in proportion to our present capacity for production the demand for all kinds of motor-vehicles is nearly as great, and there is now not the slightest doubt that the year 1900 will witness a genuine boom in everything pertaining to motors that will rejoice the hearts of shareholders in motor companies, and vindicate the hopes held out to them in the earlier days."

### Scottish Visitors in London.

"Among the numerous Scotch visitors at the show this week, I observed," continues our correspondent, "Mr. Stirling from Hamilton, and Mr. Peck, managing director of the Madelvic Motor Carriage Co., Ltd. Mr. Peck, I understand, expected to have some of his vehicles ready for exhibition in London, but found it impossible to get them ready in time, his large contract with the postal authorities having monopolised most of his efforts. I had this week the pleasure of inspecting an entirely new design of motor-carriage, specially built as a touring car by Messrs. Stirling for Mr. Reoch of Buchlyvie, and it struck me as being one of the most complete cars for the purpose which I have seen. It is built on wagonette lines and has a panelled top which is portable. The top extends over the driving seat, with hinged plate-glass windows in front, and side doors with dropping windows entirely protect the riders from the cold winds felt so much on open fast-driven cars. It is beautifully painted in claret and black with white lines, and is luxuriously upholstered in brown moroccos. Under the inside seats are four extra storage tanks for petrol while touring. It is a most elegant car, and for all-the-year-round work I can conceive of nothing more comfortable. I hope to send a photograph of this car for reproduction in next week's issue of *The Motor-Car Journal*."

THE FABRIK FÜR ELECTRISCHE AUTOMOBILWAGEN (Max Schneider & Co.) is the style of a new concern which has just been formed at Dresden.

## THE LIVERPOOL HEAVY-TRAFFIC MOTOR-VEHICLE TRIALS.

MR. E. SHRAPNELL-SMITH, the Hon. Secretary of the Liverpool Self-Propelled Traffic Association, has sent us some particulars of the above trials, which will extend from July 31st to August 2nd next. There are eleven entries, including one vehicle each from America and France, so that a most interesting contest may be anticipated. The vehicles will arrive in Liverpool on Friday, the 28th instant, but the judges require the first two days for their preliminary observations. A limited number of motor-carriages will be provided, to enable visitors to follow the competing vehicles. The hill-climbing capabilities will be tried on Monday morning, July 31st, at Everton. The manœuvring tests will take place in the afternoon at the Prince's Dock. The distance runs, about thirty-five miles each, will occupy August 1st and 2nd. The vehicles will start from the Small Dock Yard, S.W. corner of the Prince's Dock, adjoining the riverside station, beginning at 9.45 a.m. Light carriages will follow at 10.30 a.m. On Tuesday, August 1st, the run will be *via* Water Street, Dale Street, William Brown Street, London Road, Prescott Street, Old Swan, Prescott, Rainhill, Great Sankey, Widnes, Ditton, Speke Church, Garston, Aigburth Road, Park Road, St. James' Street, Park Lane, Canning Place, South Castle Street, Castle Street, Water Street, to the Yard, being "route B" of the 1898 trials. On Wednesday, August 2nd, the run will be *via* Chapel Street, Tithebarn Street, Moorfields, Dale Street, Byrom Street, Scotland Road, Walton Road, County Road, Rice Lane, Walton Vale, Aughton, Ormskirk, Scarth Hill, Rainford, Mossborough, Knowsley, The Hazels, Old Swan, Prescott Street, London Road, William Brown Street, Dale Street, Moorfields, Tithebarn Street, Chapel Street, to the Yard, being "route A" of the 1898 trials. Although the conditions stipulate level platforms, *i.e.*, lorry bodies, it is pointed out that the superstructure can be modified to meet any requirements. The Secretary of State for War, the Postmaster-General, and numerous corporations have deputed representatives to attend the trials.

The following are the entries: Class A. (minimum load, 2 tons; maximum tare, 2 tons; minimum level platform, area 50 square feet).—The Automobile Association, Ltd., London, official number, 11; T. Coulthard & Co., Cooper Road, Preston, official number, 3; The Thornton Motor Co., Ltd., Worsley Mills, Hulme, Manchester, official number, 7. Class B. (minimum load, 3½ tons; maximum tare, 3 tons; minimum level platform, area 65 square feet).—Byleys, Ltd., Newington Causeway, S.E., official number, 9; The Clarkson and Capel Steam Car Syndicate, Ltd., Deverell Street, London, S.E., official number, 6; The Graham Equipment Co., 170 Summer Street, Boston, Mass., U.S.A., official number, 8; The Lancashire Steam Motor Co., Leyland, official number, 5; Simpson and Bodman, Cornbrook, Manchester, official number, 10; The Steam Carriage and Wagon Co., Ltd., Homefield, Chiswick, official number, 1. Class C. (minimum load, 5 tons; maximum tare, 3 tons; minimum level platform area, 80 square feet).—C. & A. Musker, Ltd., Liverpool, official number, 4. Class D. (minimum load, 6½ tons; maximum tare, 4 tons; minimum level platform area, 110 square feet).—The Steam Carriage and Wagon Co., Ltd., Homefield, Chiswick, official number, 2.

L'AUTOMOBILE CLUB BOURGUIGNON is organizing a motor-tricycle race between Dijon and Chalon and back, to be run off on September 6th next. The distance is 150 kilometres.

THE illustrations Figs. 1, 3, and 20 connected with the report in the present issue of the exhibits at the Motor-Car Exhibition at Islington are reproduced from photographs taken by Messrs. Curzon, Robey & Co., 7 Newman Street, London, W., the official photographers to the Exhibition.

## Motor-Car Exhibition at Agricultural Hall.

SINCE our last issue quite a number of new motor-vehicles have been placed on exhibition at the Agricultural Hall, including several types which have not before been seen in this country, with the result that the body of the Hall now presents a crowded aspect. The attendance has considerably improved, and from the majority of the exhibitors we learn that a very large amount of business has been done. The evening sports in the arena have been continued, while the courtyard has all day long presented a most animated scene. The efficiency trials, which have been proceeding daily, the results of which up to Wednesday evening are given in another column, have also evoked considerable interest, especially on the part of the builders of the competing vehicles. Altogether the week has been of an exciting character, and those interested in motor-vehicles who have not yet inspected the show should not fail to pay it a visit either to-day or to-morrow (the closing day), otherwise they will miss an excellent opportunity of seeing for themselves the great progress that has been recently made in motor-car construction in this country.

### THE EXHIBITS.

#### [SECOND NOTICE.]

The British Motor-Coupé Co. of 366 and 368 Euston Road, London, N.W., show a couple of very comfortable motor-vehicles of the type they are now letting out on hire for private use in town or country. One is a four-seated vehicle which can be used either as an open carriage or a closed brougham. The other is a four-seated open carriage with hood. The motor is of the Daimler type of 4 h.p. nominal; it is located at the rear of the vehicle and is suspended on springs, by means of which vibration is reduced to a minimum. The cars are provided with four forward speeds, including a low one for hill-climbing, and one astern. The speed-varying gear is all controlled by one lever, the power being transmitted from the motor-shaft to the counter-shaft by belts, and from the latter to the rear road wheels by pinions and internal-toothed rings. The Coupé Co. state that these vehicles, of which an illustration was given in our issue of June 16th last, can travel fully 100 miles per day, maintaining a good speed throughout.

FIG. 1.—A GROUP OF MOTOR-CARS AND CYCLES AT THE EXHIBITION, TAKEN IN DEMONSTRATION ARENA.

Curzon Robey & Co., 7 Newman Street W.

The British Motor-Coupé Co. are also exhibiting a motor-quadracycle built by Messrs. Humber & Co., of Coventry. The vehicle, which is well finished, is fitted with a De Dion motor of  $1\frac{1}{2}$  h.p., and carries two persons. The Company has also on view an example of Messrs. De Dion and Bouton's latest productions in the way of racing motor-tricycles.
